VOL. XXVI. MAY, 1883. NO. 1.

FATHER JUNIPERO AND HIS WORK.

A SKETCH OF THE FOUNDATION, PROSPERITY, AND RUIN OF THE FRANCISCAN MISSIONS IN CALIFORNIA. I.

AMONG the treasures of the Franciscan College in Santa Barbara, California, is an old daguerreotype, taken from a portrait painted more than a hundred years ago at the College of San Fernando, in Mexico. The face is one, once seen, never to be forgotten; full of spirituality, tenderness, and unutterable pathos; the mouth and chin so delicately sensitive that one marvels how such a soul could have been capable of heroic endurance of hardship; the forehead and eyes strong, radiant with quenchless purpose, but filled with that solemn, yearning, almost superhuman sadness, which has been in all time the sign and seal on the faces of men born to die for the sake of their fellows. It is the face of Father Junipero Serra, the first founder of Franciscan Missions in South California.

Studying the lineaments of this countenance, one recalls the earliest authentic portrait of Saint Francis, the one painted by Pijano, which hangs in the sacristy of the Assisi Church. There seems a notable likeness between the two faces; the small and delicate features, the broad forehead, and the expression of great gentleness are the same in both. But the saint had a joyousness which his illustrious follower never knew. The gayety of the troubadour melodies which Francis had sung all through his youth never left his soul. Serra's first songs, and only, were the solemn chants of the Church; his first lessons in a convent, his earliest desire to become a priest.

He was born of lowly people, in the island of Majorca, and while he was yet a little child, sang as chorister in the Convent of San Bernardino. He was but sixteen when he entered the Franciscan order, and before he was eighteen he had taken the final vows. This was in the year 1730. On becoming a monk, his baptismal name, Michael Joseph, he laid aside, and took the name of Junipero, after that quaintest and drollest of all Saint Francis's early companions; him of whom the saint jocosely said, "Would that I had a whole forest of such Junipers."

It is recorded that during the months when Saint Francis went up and down the streets of Assisi, carrying in his delicate, unused hands the stones for rebuilding the St. Damiano Chapel, he was continually singing psalms, breaking forth into ejaculations of gratitude, his face beaming as that of one who saw visions of unspeakable delight.

How much of the spirit or instinct of prophecy there might have been in his exultant joy, only he himself knew; but it would have been strange if there had not been vouchsafed to him at least a partial revelation of the splendid results which must of necessity follow the carrying out in the world of the divine impulses which had blazed up in his soul like a fire.

As Columbus, from the trend of imperfectly known shores and tides, from the mysterious indications of vague, untracked wilds, could deduce the glorious certainty of hitherto undreamed continents of westward land, so might the ardent spiritual discoverer see with inextinguishable faith the hitherto undreamed heights which must be surely reached and won by the path he pointed out. It is certain that very early in his career Francis had the purpose of founding an order, whose members, being utterly unselfish in life,

[Copyright, 1883, by THE CENTURY CO. All rights reserved.]

should be fit heralds of God and mighty helpers of men. The absoluteness of self-renunciation which he inculcated and demanded startled even the thirteenth century's standard of religious devotion. Cardinals and Pope alike doubted its being within the pale of human possibility; and it was not until after much entreaty that the Church gave its sanction to the "Seraphic Saint's" band of "Fratri Minores," and the organized work of the Franciscan Order began. That was in 1208. From then until now the Franciscans have been, in the literal sense of the word, helpers of men.

Others of the orders in the Catholic Church have won more distinction, in the way of learning, political power, marvelous suffering of penances and deprivation; but the record of the Franciscans is in the main a record of lives and work, like the life and work of their founder; of whom a Protestant biographer has written:

"So far as can be made out, he thought little of himself, even of his own soul to be saved, all his life. The trouble has been on his mind, how sufficiently to work for God and to help men."

Under the head of helping men come all enterprises of discovery, development, and civilization which the earth has known: and in many more of these than the world generally suspects, this order has been an influence dating back to the saint of Assisi.

America preëminently stands his debtor. Of the three to whom belongs the honor of its discovery, one, Juan Perez de Marchena, was a Franciscan friar; the other two, Queen Isabella and Columbus, members of Saint Francis's third order; and of all the wondrous development and splendid promise on the California coast to-day, Franciscan friars were the first founders.

At the time when Junipero Serra entered the Majorca convent, three other young monks were studying there—Palon, Verger, and Crespi. The four became intimate and affectionate companions. The friendship thus early begun never waned, and no doubt their hearty and loving coöperation had much to do with the success of the great enterprises in which afterward they jointly labored, and to which, even in their student days, they looked forward with passionate longing. New Spain was, from the beginning, the goal of their most ardent wishes, and all their conversations turned on this theme.

To the eighteenth century's spiritual enthusiast, a wilderness full of savage souls in danger of hell was a stronger lure than unconquered worlds to an Alexander. It is impossible at this distance of time to get any complete realization of the halo of exalted sentiment and rapture which then invested undertakings of this kind. It reached from the highest to the lowest, the oldest to the

OLD ENGRAVING OF A SHIP FOR AN ANCIENT MAP, MADE BY A BENEDICTINE MONK ABOUT 1740.

FATHER JUNIPERO SERRA.

youngest. Every art was lent to its service; every channel of expression was stamped with its sign. Even on the wide charts and atlases of the day were pictures of monks embarking in ships of discovery: the Virgin herself looking on, from the skies, with the motto above, "Matre Dei Monstrante viam," and on the ships' sails, "Unus non sufficit orbis."

Long years of delay and monastic routine did not dampen the ardor of the four friends. Again and again they petitioned to be sent as missionaries to the New World, and again and again were disappointed. At last, in 1749, there assembled in Cadiz a great body of missionaries, destined chiefly for Mexico, and Palon and Serra received permission to join the band. Arriving at Cadiz, and finding two vacancies still left in the party, they pleaded warmly that Crespi and Verger be allowed to go also. At the very last moment this permission was given, and the four friends set sail, joyful, in the same ship.

In the memoir of Junipero Serra, written by his friend Palon, are many interesting incidents of their voyage to Vera Cruz. It lasted ninety-nine days. Provisions and water fell short; starvation threatened; terrific storms nearly wrecked the ship; but through all Father Junipero's courage never failed. "Remembering the end for which they had come," he said, he felt no fear. He performed mass each morning, and cheered the sinking spirits of all on board by psalms and exhortations; by humorous sayings also, announcing one day with great gravity that he had discovered "the secret of keeping free from thirst." It was to "eat little and speak less."

For nineteen years after their arrival in Mexico, Serra and his companions were kept at work there, under the guidance and control of the College of San Fernando, in founding missions and preaching.

On the suppression of the Jesuit Order in 1767, and its consequent expulsion from all the Spanish dominions, it was decided to send a body of Franciscans to take charge of the Jesuit missions in California. These were all in Lower California, no attempt at settlement having yet been made in Upper California. Once more the friends, glad and exultant, joined a missionary band, bound to new wildernesses. They were but three now, Verger remaining behind in charge of the College of San Fernando. The band numbered sixteen. Serra was put in charge of it, and was appointed president of all the California missions.

OLD MILL BUILT BY INDIANS AT SAN ANTONIO.

His biographer says he received this appointment "unable to speak a single word for tears." It was not strange, on the realization of a hope so long deferred. He was now fifty-six years old; and from boyhood his longing had been to labor among the Indians on the western shores of the New World.

It was now the purpose of the Spanish Government to proceed as soon as possible to the colonization of Upper California. The passion of the Church allied itself gladly with the purpose of the State; and the State itself had among its statesmen and soldiers many men who were hardly less fervid in religion than were those sworn exclusively to the Church's service. Such an one was Joseph de Galvez, who held the office of Visitor-General and Commander, representing the person of the King, and inspecting the working of the Government in every province of the Spanish empire. Upon him rested the responsibility of the practical organization of the first expedition into Upper California. It was he who ordered the carrying of all sorts of seeds of vegetables, grains, and flowers; everything that would grow in old Spain he ordered to be planted in New. He ordered that two hundred head of cattle should be taken from the northernmost of the Lower California missions, and carried to the new posts. It was he also, as full of interest for chapel as for farm, who selected and packed with his own hands sacred ornaments and vessels for church ceremonies. A curious letter of his to Palon is extant, in which he says laughingly that he is a better sacristan than Father Junipero, having packed the holy vessels and ornaments quicker and better than he. There are also extant some of his original instructions to military and naval commanders which show his religious ardor and wisdom. He declares that the first object of the expedition is "to establish the Catholic religion among a numerous heathen people, submerged in the obscure darkness of paganism, to extend the dominion of the King our Lord, and to protect this peninsula from the ambitious views of foreign nations."

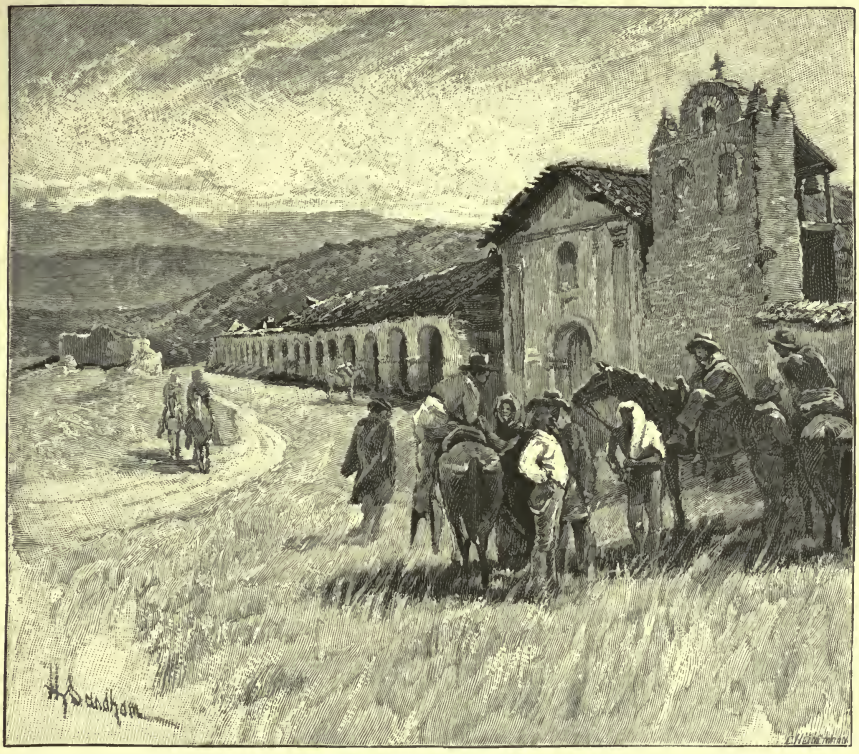
With no clearer knowledge than could be derived from scant records of Viscayno's voyage in 1602, he selected the two best and most salient points of the California coast, San Diego and Monterey, and ordered the founding of a mission at each. He also ordered the selection of a point midway between these two, for another mission, to be called Buena Ventura. His activity, generosity, and enthusiasm were inexhaustible. He seems to have had humor as well; for, when discussing the names of the missions to be founded, Father Junipero said to him, "But is there to be no mission for our Father St. Francis?" he replied, "If St. Francis wants a mission, let him show us his post, and we will put one there for him!"

The records of this first expedition into California are full of interest. It was divided into two parts, one to go by sea and one by land; the sea party in two ships, and the land party in two divisions. Every possible precaution and provision was thought of by the wise Galvez; but neither precaution nor provision could make the journey other than a terrible one. Father Junipero, with his characteristic ardor, insisted on accompanying one of the land parties, although he was suffering severely from an inflamed leg, the result of an injury he had received twenty years before in journeying on foot from Vera Cruz to the city of Mexico. Galvez tried in vain to detain him; he said he would rather die on the road than not go, but that he should not die, for the Lord would carry him through. However, on the second day out his pain became so great that he could neither sit, stand, nor sleep. Portalá, the military commander of the party, implored him to be car

ried in a litter; but this he could not brook. Calling one of the muleteers to him, he said:

"Son, do you not know some remedy for this sore on my leg?"

"Father," replied the muleteer, "what remedy can I know? I have only cured beasts."



SANTA YNEZ MISSION.

"Then consider me a beast," answered Serra; "consider this sore on my leg a sore back, and give me the same treatment you would apply to a beast."

Thus adjured, the muleteer took courage, and saying, "I will do it, Father, to please you," he proceeded to mix herbs in hot tallow, with which he anointed the wound, and so reduced the inflammation that Father Junipero slept all night, rose early, said matins and mass, and resumed his journey in comparative comfort. He bore this painful wound to the end of his life; and it was characteristic of the man as well as of the abnormal standards of the age, that he not only sought no measures for a radical cure of the diseased member, but, obstinately accepting the suffering as a cross, allowed the trouble to be aggravated in every way, by going without shoes or stockings, and by taking long journeys on foot.

A diary kept by Father Crespi on his toilsome march from Velicatá to San Diego is full of quaint and curious entries, monotonous in its religious reiterations, but touching in its simplicity and unconscious testimony to his own single-heartedness and patience. The nearest approach to a complaint he makes is to say that "nothing abounds except stones and thorns." When they journey for days with no water except scanty rations from the precious casks they are carrying, he always piously trusts water will be found on the morrow; and when they come to great tracts of impenetrable cactus thickets, through which they are obliged to hew a pathway with axes, as through a forest, and are drenched to the skin in cold rains, and deserted by the Christian Indians whom they had brought from Lower California as guides, he mentions the facts without a murmur, and has even for the deserters only a benediction: "May God guard the misguided ones." A far more serious grievance to him is that toward the end of the journey he could no longer celebrate full mass because the wafers had given out. Sometimes the party found themselves hemmed in by mountains, and were forced to halt for days while scouts went ahead to find a pass. More than once, hoping that at last they had found a direct and easy route, they struck

SAN ANTONIO MISSION.

down to the sea-shore, only to discover themselves soon confronted by impassable spurs of the coast range, and forced to toil back again up into the labyrinths of mesas and cactus plains. It was Holy Thursday, the 24th of March, when they set out, and it was not until the 13th of May that they reached the high ground from which they had their first view of the bay of San Diego, and saw the masts of the ships lying at anchor there—"which sight was a great joy and consolation to us all," says the diary.

They named this halting-place "Espiritu Santo." It must have been on, or very near, the ridge where now runs the boundary line between the United States and Mexico, as laid down by the treaty of Guadalupe Hidalgo. It is a grand promontory, ten miles south-east of San Diego, thrusting out to sea; bare of trees, but matted thick with the dewy ice-plant, and in early spring carpeted with flowers. An ugly monument of stone stands there, bearing the names of the American and Mexican commissioners who established this boundary line in October, 1849. It would seem much more fitting to have there a monument bearing the names of the heroic men—friars and soldiers of Spain—who on that spot on May 14, 1769, sang the first Easter hymn heard on California shores.

It was a sore grief for Father Crespi that the commandant of the party would not wait here for him to say a mass of thanksgiving; but, with the port in sight, impatience could not be restrained, and the little band pushed on. As soon as the San Diego camp was seen, the soldiers discharged a salute of fire-arms, which was answered instantly from

shore and ship. Great joy filled every heart. The friars who had come by sea ran to meet and embrace their brothers. The gladness was dampened only by the sad condition of the ships' crews, many of whom were dead or dying. They had been four months, with their poor charts and poorer ships, making their way from La Paz up to San Diego; and, in consequence of insufficient and unwholesome food, the scurvy had broken out among them. It was a melancholy beginning for the new enterprise. When, six weeks later, the second land party with Father Junipero arrived, eager to proceed to the establishing of the mission, they found that their first duty was to the sick and dying of their own people. In fifteen days twenty-nine of the sailors and soldiers died. The Indians, who at first had been gentle and friendly, grew each day more insolent and thievish, even tearing off the clothes of the sick lying helpless in the tents or tule huts on the beach. At last, on the 16th of July, a cross was set up facing the port, and in a rude booth of branches and reeds, mass was celebrated and the grand hymn of "Veni Creator" was sung, the pilgrims "supplying the want of an organ by discharging fire-arms," says the old record, and with only the "smoke of muskets for incense." Thus was founded the Mission of San Diego; and thus was laid the corner-stone of the civilization of California on July 16, 1769.

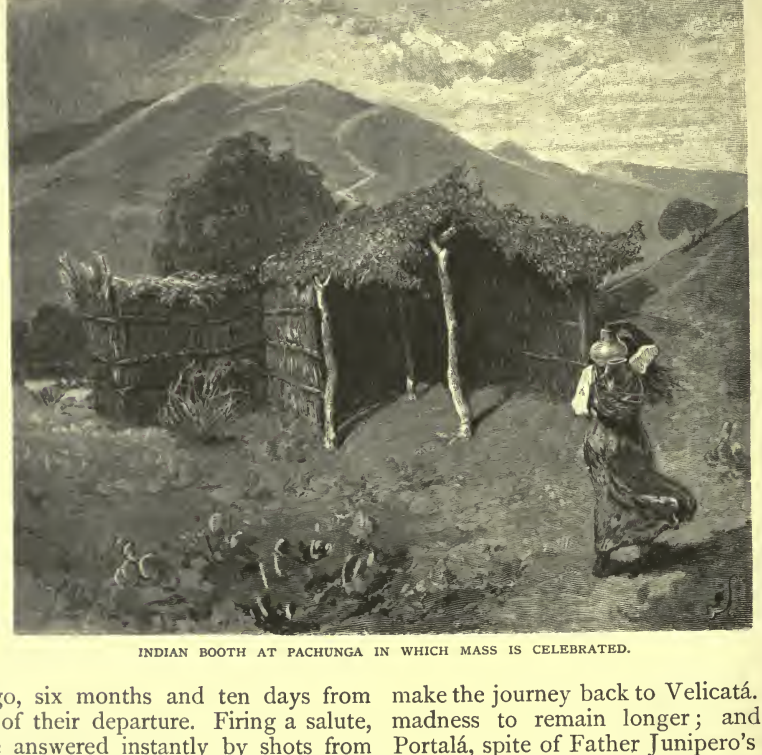
Two days before this the indefatigable Crespi had set off with another overland party, Portalá at its head, to find Monterey. On this journey, also, Father Crespi kept a diary,—little suspecting, probably, with how much interest it would be studied a century later. It was not strange that, with only a compass and seventeenth century charts to guide them along the zigzagging labyrinths of bays, headlands, and sand-hills which make the California shore, they toiled to no purpose seeking the Monterey harbor. It is pitiful to read the record of the days when they were close upon it, setting up a cross on one of its hills, and yet could not see it; even querying, so bewildered and lost were they, if it might not have been filled up with sands since Viscayno's time. Forty leagues north of it they went, and discovered the present bay of San Francisco, which they at once recognized by Viscayno's description; and recalling the speech of Galvez in regard to Saint Francis pointing out a port if he wanted a mission of his own name, the pious fathers thought it not unlikely, that the saint himself had hidden Monterey from their sight, and led them to his own harbor. Month after month passed, and still they were wandering. They were foot-sore, weary, hungry, but not

BELLS OF THE SAN GABRIEL MISSION.

disheartened. Friendly Indians everywhere greeted them kindly, gave them nuts, and shell-fish, and bread made from acorn flour. At one time seventeen of the party were too ill to travel. Twice they halted and held council on the question of abandoning the search. Some were ready to continue as long as the provisions held out, then to eat their mules, and go back on foot. Fathers Crespi and Gomez volunteered to be left behind alone.

At last, on the 11th of November, it was decided to return by the route by which they had come. On the 20th, finding that their flour had been stolen by the soldiers, they divided the remainder into equal parts, giving to each person enough to last him two days. On Christmas Day, they had a present of nuts from friendly Indians, and on New Year's Day they had the luck to kill a bear and three

cubs, which gave them a feast for which they offered most devout thanksgivings. For the rest, they lived chiefly on mussels, with now and then a wild goose. On the 24th of January they came out on the table-lands above that of this little, suffering band, separated by leagues of desert and leagues of ocean from all possible succor. At last, an examination showed that there were only provisions sufficient left to subsist the party long enough to



INDIAN BOOTH AT PACHUNGA IN WHICH MASS IS CELEBRATED.

San Diego, six months and ten days from the time of their departure. Firing a salute, they were answered instantly by shots from the camp, and saw an eager crowd running to meet them, great anxiety having been felt at their long absence.

It is worth while, in studying the history of these Franciscan Missions, to dwell on the details of the hardships endured in the beginning by their founders. Only narrow-minded bigotry can fail to see in them proofs of a spiritual enthusiasm and exaltation of self-sacrifice which are rarely paralleled in the world's history. And to do justice to the results accomplished, it is necessary to understand thoroughly the conditions at the outset of the undertaking.

The weary, returned party found their comrades in sorry plight. The scurvy had spread, and many more had died. Father Junipero himself had been dangerously ill with it; provisions were running low; the Indians were only half friendly, and were not to be trusted out of sight. The supply-ships looked for from Mexico had not arrived.

A situation more helpless, unprotected, discouraging, could not be conceived, than make the journey back to Velicatá. It seemed madness to remain longer; and Governor Portalá, spite of Father Junipero's entreaties, gave orders to prepare for the abandonment of the missions. He fixed the 20th of March as the last day he would wait for the arrival of the ship. This was St. Joseph's Day. On the morning of it, Father Junipero, who had been praying night and day for weeks, celebrated to St. Joseph a high mass, with special supplications for relief. Before noon a sail was seen on the horizon. One does not need to believe in saints and saints' interpositions to feel a thrill at this coincidence, and in fancying the effect the sudden vision of the relief-ship must have produced on the minds of devout men who had been starving. The ship appeared for a few moments—then disappeared; doubtless there were some who scoffed at it as a mere apparition. But Portalá believed, and waited; and, four days later in the ship came!—the *San Antonio*, bringing bountiful stores of all that was needed.

Courage and cheer now filled the very air. No time was lost in organizing expeditions to go once more in search of the mysteriously hidden Monterey. In less than three weeks

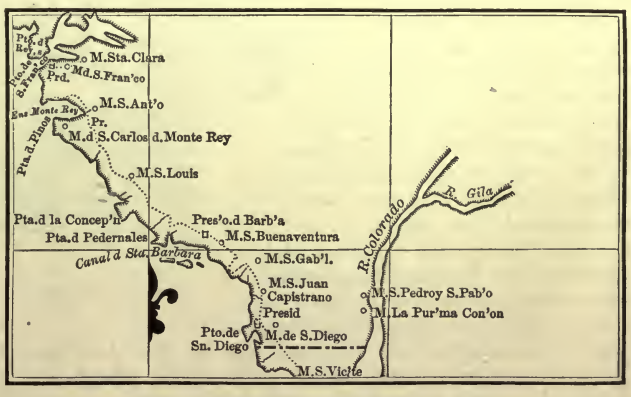
two parties had set off—one by sea in the *San Antonio*. With this went Father Junipero, still feeble from illness. Father Crespi, undaunted by his former six months of wandering, joined the land party, reaching the Point of Pines, on Monterey Harbor, seven days before the ship arrived. As soon as she came in sight bonfires were lighted on the rocks, and the ship answered by firing cannon. It was a great rejoicing. The next day, June 1st, the officers of the two parties met, and exchanged congratulations; and on the third they took formal possession of the place: first, in the name of the Church, by religious ceremonies; secondly, in the name of the King of Spain, unfurling the royal standard, and planting it in the ground, side by side with the cross.

To one familiar with the beauty of the Monterey shore in June, the picture of this scene is vivid. The sand-dunes were ablaze with color; lupines in high, waving masses, white and yellow; and great mats of the glittering ice-plant, with myriads of rose-colored umbels, lying flat on the white sand. Many rods inland, the air was sweet with their fragrance, borne by the strong sea-wind. On long cliffs of broken, tempest-piled rocks stood ranks upon ranks of grand old cypress-trees,—gnarled, bent, twisted, defiant, full of both pathos and triumph in their loneliness, in this the only spot on earth to which they are native.

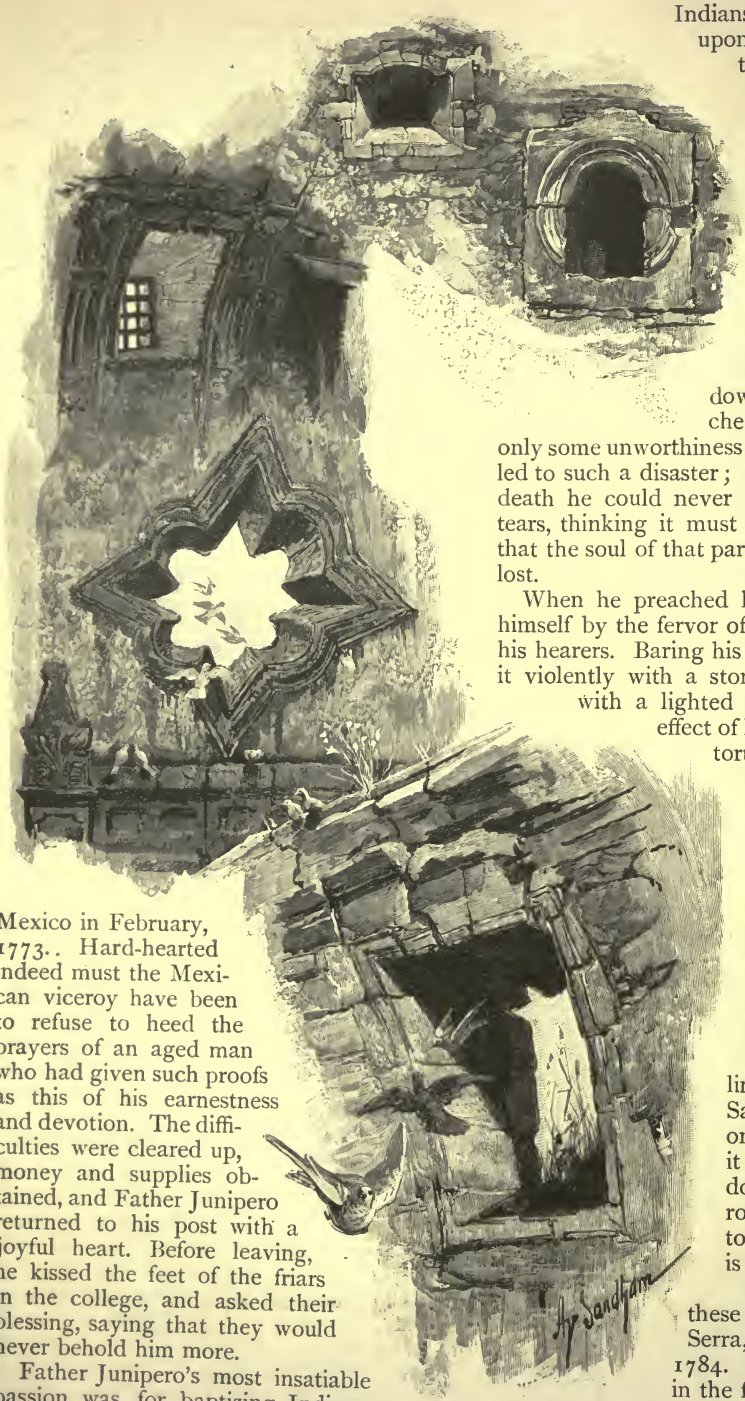
The booth of boughs in which the mass was performed was built under a large oak, on the same spot where Viscayno had landed and his Carmelite monks had said mass one hundred and sixty-seven years before. The ceremonies closed with a ringing Te Deum,—sailors, soldiers, monks, alike jubilant.

When the news of the founding of this second mission reached the city of Mexico, there was a furore of excitement. The bells of the city were rung; people ran up and down the streets telling each other; and the viceroy held at his palace a grand reception, to which went all persons of note, eager to congratulate him and Galvez. Printed proclamations, giving full accounts, were circulated, not only in Mexico but throughout Spain. No province so remote, no home so lowly, as to fail to hear the good news. It was indeed good news to both state and church. The fact of the occupation of the new country was accomplished; the scheme for the conversion and salvation of the savage race was fairly inaugurated; Monterey and San Diego being assured, ultimate possession of the whole of the coast line between would follow. Little these gladdened people in Spain and Mexico realized, however, the cost of the triumph over which they rejoiced, or the true condition of the men who had won it.

The history of the next fifteen years is a history of struggle, hardship, and heroic achievement. The indefatigable Serra was the mainspring and support of it all. There seemed no limit to his endurance, no bound to his desires; nothing daunted his courage or chilled his faith. When, in the sixth year after the founding of the San Diego Mission, it was attacked by hostile Indians, one of the fathers being most cruelly murdered, and the buildings burned to the ground, Father Junipero exclaimed, "Thank God! The seed of the Gospel is now watered by the blood of a martyr; that mission is henceforth established"; and in a few months he was on the spot, with money and materials, ready for rebuilding; pressing sailors, neophytes, soldiers, into the service; working with his own hands also, spite of the fears and protestations of all, and only desisting on positive orders from the military commander. He journeyed, frequently on foot, back and forth through the country, founding a new mission whenever, by his urgent letters to the College of San Fernando and to the Mexican viceroys, he had gathered together men and money enough to do so. In 1772, when perplexities seemed inextricably thickened and supplies had fallen so short that starvation threatened the missions, he took ship to San Blas. With no companion except one Indian boy, he toiled on foot from San Blas to Guadalajara, two hundred and forty miles. Here they both fell ill of fever, and sank so low that they were supposed to be dying, and the Holy Viaticum was administered to them. But they recovered, and, while only partly convalescent, pushed on again, reaching the city of



MAP OF THE COAST LINE, DRAWN IN 1787.



SOME OF THE WINDOWS AT SAN CARLOS.

Mexico in February, 1773.. Hard-hearted indeed must the Mexican viceroy have been to refuse to heed the prayers of an aged man who had given such proofs as this of his earnestness and devotion. The difficulties were cleared up, money and supplies obtained, and Father Junipero returned to his post with a joyful heart. Before leaving, he kissed the feet of the friars in the college, and asked their blessing, saying that they would never behold him more.

Father Junipero's most insatiable passion was for baptizing Indians, the saving of one soul thus from death filled him with unspeakable joy. His biographer illustrates this by the narrative of the first infant baptism attempted at the San Diego Mission. The Indians had been prevailed upon to bring an infant to receive the consecration. Everything was ready: Father Junipero had raised his hand to sprinkle the child's face; suddenly heathen terror got the better of the parents, and in the twinkling of an eye they snatched their babe and ran. Tears rolled down Father Junipero's cheeks: he declared that only some unworthiness in himself could have led to such a disaster; and to the day of his death he could never tell the story without tears, thinking it must be owing to his sins that the soul of that particular child had been lost.

When he preached he was carried out of himself by the fervor of his desire to impress his hearers. Baring his breast, he would beat it violently with a stone, or burn the flesh with a lighted torch, to enhance the effect of his descriptions of the tortures of hell. There is in his memoir a curious engraving, showing him lifted high above a motley group of listeners, holding in his hands the blazing torch and the stone.

In the same book is an outline map of California as he knew it. It is of the coast line from San Diego to San Francisco, and the only objects marked on it are the missions and dotted lines showing the roads leading from one to another. All the rest is a blank.

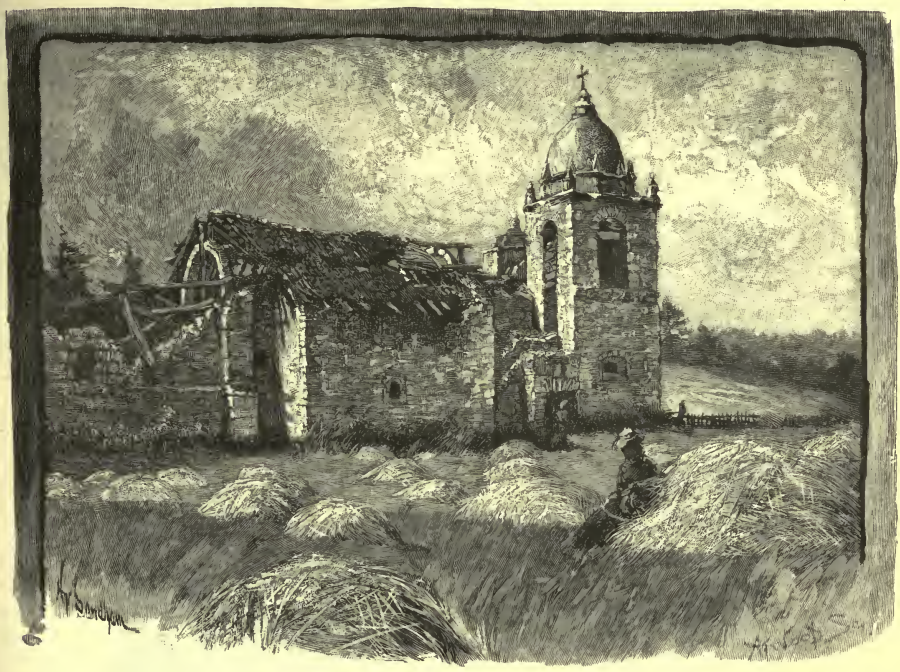
There were nine of these missions, founded by Serra, before his death in 1784. They were founded in the following order:

San Diego, July 16, 1769; San Carlos de Monterey, June 3, 1770; San Antonio de Padua, July 14, 1771; San Gabriel, September 8, 1771; San Luis Obispo, September 1, 1772; San Francisco (Dolores), October

9, 1776; San Juan Capistrano, November 1, 1776; Santa Clara, January 18, 1777; San Buena Ventura, March 31, 1782.

The transports into which Father Junipero was thrown by the beginning of a new mission are graphically told by the companion who went with him to establish the mission of San Antonio. With his little train of soldiers, and mules laden with a few weeks' supplies, he wandered off into the unexplored wilderness sixty miles south of Monterey, looking eagerly for river valleys promising fertility. As soon as the beautiful oak-shaded plain, with its river swift and full even in July, caught his eye, he ordered a halt, seized the bells, tied them to an oak bough, and fell to ringing them with might and main, crying aloud: "Hear, hear, O ye Gentiles! Come to the Holy Church! Come to the faith of Jesus Christ!" Not a human creature was in sight, save his own band, and his companion remonstrated with him. "Let me alone," cried Father Junipero. "Let me unburden my heart, which could wish that this bell should be heard by all the world, or at least by all the Gentiles in these mountains"; and he rang on till the echoes answered, and one astonished Indian appeared — the first instance in which a native had been present at the foundation of a mission. Not long afterward came a very aged Indian woman named Agreda, begging to be baptized, saying that she had seen a vision in the skies of a man clad like the friars, and that her father had repeated to her in her youth the same words they now spoke.

The history of this San Antonio Mission justified Father Junipero's selection. The site proved one of the richest and most repaying, including, finally, seven large farms with a chapel on each, and being famous for the best wheat grown and the best flour made in the country. The curious mill in which the flour was ground is still to be seen — a most interesting ruin. It was run by water brought in a stone-walled ditch for many miles, and driven through a funnel-shaped flume so as to strike the side of a large water-wheel, revolving horizontally on a shaft. The building of this aqueduct, and the placing of the wheel, were the work of an Indian named Nolberto, who took the idea from the balance-wheel of a watch, and did all the work with his own hands. The walls are broken now; and the sands have so blown in and piled around the entrance, that the old wheel seems buried in a cellar; linnets have builded nests in the dusky corners, and are so seldom disturbed that their bright eyes gaze with placid unconcern at curious intruders.



SAN CARLOS MISSION.

Many interesting incidents are recorded in connection with the establishment of these first missions. At San Gabriel; the Indians

INTERIOR OF SAN CARLOS MISSION, SHOWING ORIGINAL SPRING OF ROOF AND CURVE OF WALLS.

gathered in great force, and were about to attack the little band of ten soldiers and two friars preparing to plant their cross; but on the unfurling of a banner with a life-size picture of the Virgin painted on it, they flung away their bows and arrows, came running toward the banner with gestures of reverence and delight, and threw their beads and other ornaments on the ground before it, as at the feet of a suddenly recognized queen.

The San Gabriel Indians seem to have been a superior race. They spoke a soft, musical language, now nearly lost. Their name for God signified "Giver of Life." They had no belief in a devil or in hell, and persisted always in regarding them as concerning only white men. Robbery was unknown among them, murder was punished by death, and marriage between those near of kin was not allowed. They had names for the points of the compass, and knew the North Star, calling it Runi. They had games at which they decked themselves with flower garlands, which wreathed their heads and hung down to their feet. They had certain usages of politeness, such as that a child, bringing water to an elder, must not taste it on the way; and that to pass between two who were speaking was an offense. They had song contests, often lasting many days, and sometimes handed down to the next generation. To a people of such customs as these, the symbols, shows, and ceremonies of the Catholic Church must needs have seemed especially beautiful and winning.

The records of the founding of these missions are similar in details, but are full of interest to one in sympathy either with their spiritual or their historical significance. The

routine was the same in all cases. A cross was set up; a booth of branches was built; the ground and the booth were consecrated by holy water and christened by the name of a saint; a mass was performed; the neighboring Indians, if there were any, were roused and summoned by the ringing of bells swung on limbs of trees; presents of cloth and trinkets were given them to inspire them with trust, and thus a mission was founded. Two monks (never, at first, more) were appointed to take charge of this cross and booth, and to win, baptize, convert, and teach all the Indians to be reached in the region. They had for guard and help a few soldiers, and sometimes a few already partly civilized and Christianized Indians; several head of cattle, some tools and seeds, and holy vessels for the church service, completed their store of weapons, spiritual and secular, offensive and defensive, with which to conquer the wilderness and its savages. There needs no work of the imagination to help this picture. Taken in its sternest realism it is vivid and thrilling; contrasting the wretched poverty of these single-handed beginnings with the final splendor and riches attained, the result seems well-nigh miraculous.

From the rough booth of boughs and reeds of 1770 to the pillars, arched corridors and domes of the stately stone churches of a half-century later, is a change only a degree less wonderful than the change in the Indian, from the naked savage, with his one stone tool, grinding acorn-meal in a rock bowl, to the industrious tiller of soil, weaver of cloth, worker in metals, and singer of sacred hymns. The steps of this change were slow at first. In 1772, at the end of five years' work, five missions had been founded, and four hundred and ninety-one Indians baptized. There were then, in these five missions, but nineteen friars and sixty soldiers. In 1786, La Perouse, a French naval commander, who voyaged along the California coast, leaves it on record that there were but two hundred and eighty-two soldiers, and about one hundred officers and friars, all told, in both Upper and Lower California, from Cape Saint Lucas to San Francisco, a line of eight hundred leagues. At this time there were five thousand one hundred and forty-three Indians, in the missions of Upper California alone. In the year 1800 there were, at the mission of San Diego, fifteen hundred and twenty-one Indians; and the San Diego garrison, three miles away from the mission, numbered only one hundred and sixty-seven souls,—officers, soldiers, servants, women, and children. Such figures as these seem sufficient refutation of the idea sometimes advanced, that the Indians were converted by force and held in subjection by terror. There is still preserved in the archives of the Franciscan College at Santa Barbara, a letter written by Father Junipero to the Viceroy of Mexico, in 1776, imploring him to send a force of eighty soldiers to be divided among seven missions. He patiently explains that the friars, stationed by twos, at new missions, from sixty to a hundred miles distant from each other, cannot be expected to feel safe without a reasonable military protection; and he asks pertinently what defense could be made, "in case the enemy should tempt the Gentiles to attack us." That there was so little active hostility on the part of the savage tribes, that they looked so kindly as they did to the ways and restraints of the new life, is the strongest possible proof that the methods of the friars in dealing with them must have been both wise and humane.

During the first six years there was but one serious outbreak,—that at San Diego; no retaliation was shown toward the Indians for this: on the contrary, the orders of both friars and military commanders were that they should be treated with even greater kindness than before; and in less than two years the mission buildings were rebuilt, under a guard of only a half-score of soldiers with hundreds of Indians looking on, and many helping cheerfully in the work. The San Carlos Mission at Monterey was Father Junipero's own charge. There he spent all his time, when not called away by his duties as president of the missions. There he died, and there he was buried. There, also, his beloved friend and brother, Father Crespi, labored by his side for thirteen years. Crespi was a sanguine, joyous man, sometimes called El Beato, from his happy temperament. No doubt, his gayety made Serra's sunshine in many a dark day; and grief at his death did much to break down the splendid old man's courage and strength. Only a few months before it occurred, they had gone together for a short visit to their comrade, Father Palon, at the San Francisco Mission. When they took leave of him, Crespi said, "Farewell forever; you will see me no more." This was late in the autumn of 1781, and on New Year's Day, 1782, he died, aged sixty years, and having spent half of those years in laboring for the Indians. Serra lived only two years longer, and is said never to have been afterward the same as before. For many years he had been a great sufferer from an affection of the heart—aggravated, if not induced, by his fierce beatings of his breast with a stone, while he was preaching. But physical pain seemed to make no impression on his mind. If it did not incapacitate him

THE FUNERAL OF FATHER JUNIPERO.

for action, he held it of no account. Only the year before his death, being then seventy years old, and very lame, he had journeyed on foot from San Diego to Monterey, visiting every mission and turning aside into all the Indian settlements on the way. At this time there were on the Santa Barbara coast alone, within a space of eighty miles, twenty-one villages of Indians, roughly estimated as containing between twenty and thirty thousand souls. He is said to have gone weeping from village to village because he could do nothing for them.

He reached San Carlos in January, 1784, and never again went away. The story of his last hours and death is in the old church records of Monterey, written there by the hand of the sorrowing Palon the second day after he had closed his friend's eyes. It is a quaint and touching narrative.

Up to the day before his death, his indomitable will upholding the failing strength of his dying body, Father Junipero had read in the church the canonical offices of each day, a service requiring an hour and a half of time. The evening before his death he walked alone to the church to receive the last sacrament. The church was crowded to overflowing with Indians and whites, many crying aloud in uncontrollable grief.

Father Junipero knelt before the altar with great fervor of manner, while Father Palon, with tears rolling down his cheeks, read the services for the dying, gave him absolution, and administered the Holy Viaticum. Then rose from choked and tremulous voices the strains of the grand hymn "Tantum Ergo."

Tantum ergo Sacramentum

Compar sit laudatio.

A startled thrill ran through the church as Father Junipero's own voice, "high and strong as ever," says the record, joined in the hymn. One by one the voices of his people broke down, stifled by sobs, until at last the dying man's voice, almost alone, finished the hymn. After this he gave thanks, and, returning to his cell-like room, spent the whole of the night in listening to penitential psalms and litanies, and giving thanks to God: all the time kneeling or sitting on the ground supported by the loving and faithful Palon. In the morning, early, he asked for the plenary indulgence, for which he again knelt, and confessed again. At noon, the chaplain and the captain of the bark *St. Joseph*, then lying in port at Monterey, came to visit him. He welcomed them, and, cordially embracing the chaplain, said, "You have come just in time to cast the earth upon my body." After they took their leave, he asked Palon to read to him again the Recommendations of the Soul. At its conclusion he responded earnestly, in as clear voice as in health, adding, "Thank God, I am now without fear." Then with a firm step he walked to the kitchen, saying that he would like a cup of broth. As soon as he had taken the broth, he exclaimed, "I feel better now; I will rest"; and, lying down, he closed his eyes, and without another word or sign of struggle or pain, ceased to breathe; entering indeed into a rest of which his last word had been solemnly prophetic.

Ever since morning the grief-stricken people had been waiting and listening for the tolling death-bell to announce that all was over. At its first note they came in crowds, breathless, weeping, and lamenting. It was with great difficulty that the soldiers could keep them from tearing Father Junipero's habit piecemeal from his body, so ardent was their desire to possess some relic of him. The corpse was laid at once in a coffin which he himself had ordered made many weeks before. The vessels in port fired a salute of one hundred and one guns, answered by the same from the guns of the presidio at Monterey—an honor given to no one below the rank of general. But the hundred gun salutes were a paltry honor in comparison with the tears of the Indian congregation. Soldiers kept watch around his coffin night and day till the burial, but they could not hold back the throngs of the poor creatures who pressed to touch the hand of the Father they had so much loved, and to bear away something, if only a thread, of the garments he had worn.

His ardent and impassioned nature and his untiring labors had won their deepest affection and confidence. It was his habit when at San Carlos to spend all his time with them, working by their side in the fields, making adobe, digging, tilling, doing, in short, all that he required of them. Day after day he thus labored, only desisting at the hours for performing offices in the church. Whenever an Indian came to address him, he made the sign of the cross on his forehead, and spoke to him some words of spiritual injunction or benediction. The arbitrariness, or, as some of his enemies called it, haughty self-will, which brought Serra at times into conflict with the military authorities when their purposes or views clashed with his own, never came to the

surface in his spiritual functions, or in his relation with the Indian converts. He loved them, and yearned over them as brands to be snatched from the burning. He had baptized over one thousand of them with his own hands; his whole life he spent for them, and was ready at any moment to lay it down if that would have benefited them more. Absolute single-heartedness like this is never misunderstood by, and never antagonizes equally single-hearted people, either high or low. But, to be absolutely single-hearted in a moral purpose is almost inevitably to be doggedly one-ideaed in regard to practical methods, and the single-hearted, one-ideaed man, with a great moral purpose, is sure to be often at swords' points with average men of selfish interests and mixed notions. This is the explanation of the fact that the later years of Serra's life were marred by occasional collisions with the military authorities in the country. No doubt the impetuosity of his nature made him sometimes hot in resentment and indiscreet of speech. But, in spite of these failings, he yet remains the foremost, grandest figure in the missions' history. If his successors in their administration had been equal to him in spirituality, enthusiasm, and intellect, the mission establishments would never have been so utterly overthrown and ruined.

Father Junipero sleeps on the spot where he labored and died. His grave is under the ruins of the beautiful stone church of his mission — the church which he saw only in ardent and longing fancy. It was, perhaps, the most beautiful, though not the grandest of the mission churches, and its ruins have to-day a charm far exceeding all the others. The fine yellow tint of the stone, the grand and unique contour of the arches, the beautiful star-shaped window in the front, the simple yet effective lines of carving on pilaster and pillar and door-way, the symmetrical Moorish tower and dome, the worn steps leading up to the belfry,—all make a picture whose beauty, apart from hallowing associations, is enough to hold one spell-bound. Reverent nature has rebuilt with grass and blossoms even the crumbling window-sills, across which the wind blows free from the blue ocean just beyond; and on the day we saw the place, golden wheat, fresh reaped, was piled in loose mounds on the south slope below the church's southern wall; it reminded me of the tales I had heard from many aged men and women of a beautiful custom the Indians had of scattering their choicest grains on the ground at the friars' feet, as a token of homage.

The roof of the church long ago fell in; its doors have stood open for years; and the fierce sea-gales have been sweeping in, piling sands until a great part of the floor is covered with solid earth on which every summer grasses and weeds grow high enough to be cut by sickles. Of the thousands of acres which the Mission Indians once cultivated in the San Carlos valley, only nine were finally decreed by the United States Government to belong to the church. These were so carelessly surveyed that no avenue of approach was left open to the mission buildings, and a part of the land had to be sold to buy a right of way to the church. The remnant left makes a little farm, by the rental of which a man can be hired to take charge of the whole place, and keep it, if possible, from further desecration and ruin. The present keeper is a devout Portuguese, whose broken English becomes eloquent as he speaks of the old friars whose graves he guards.

"Dem work for civilize," he said, "not work for money. Dey work to religion."

In clearing away the earth at the altar end of the church, in the winter of 1882, this man came upon stone slabs evidently covering graves. On opening one of these graves, it was found to hold three coffins. From the minute description, in the old records, of Father Junipero's place of burial, Father Carenova, the priest now in charge of the Monterey parish, became convinced that one of these coffins must be his. On the opposite side of the church is another grave, where are buried two of the earliest governors of California.

It is a disgrace to both the Catholic Church and the State of California that this grand old ruin, with its sacred sepulchers, should be left to crumble away. If nothing is done to protect and save it, one short hundred years more will see it a shapeless, wind-swept mound of sand. It is not in our power to confer honor or bring dishonor on the illustrious dead. We ourselves, alone, are dishonored when we fail in reverence to them. The grave of Junipero Serra may be buried centuries deep and its very place forgotten, yet his name will not perish, nor his fame suffer. But, for the men of the country whose civilization he founded, and of the Church whose faith he so glorified, to permit his burial-place to sink into oblivion, is a shame indeed!

H. H.

[The Author desires to express her acknowledgments to H. H. Bancroft, of San Francisco, who kindly put at her disposal all the resources of his invaluable library. Also to the Superior of the Franciscan College in Santa Barbara, for the loan of important books and manuscripts and the photograph of Father Junipero.]

A BALLAD OF THE MIST.

"I LOVE the Lady of Merle," he said.
"She is not for thee!" her suitor cried;
And in the valley the lovers fought
By the salt river's tide.

The braver fell on the dewy sward,
The unloved lover returned once more;
In yellow satin the lady came
And met him at the door.

"Hast thou heard, dark Edith," laughed he grim,
"Poor Hugh hath craved thee many a day?
Soon would it have been too late for him
His low-born will to say.

"I struck a blade where lay his heart's love,
And voice for thee have I left him none
To brag he still seeks thee over the hills
When thou and I are one!"

Fearless across the wide country
Rode the dark Lady Edith of Merle;
She looked at the headlands soft with haze,
And the moor's mists of pearl.

The moon it struggled to see her pass
Through its half-lit veils of driving gray;
But moonbeams were slower than the steed
That Edith rode away.

Oh, what was her guerdon and her haste,
While cried the far screech-owl in the tree,
And to her heart crept its note so lone
Beating tremulously?

About her a black scarf floated thin,
And over her cheek the mist fell cold,
And shuddered the moon between its rifts
Of dark cloud's silvery fold.

Oh, white fire of the nightly sky
When burns the moon's wonder wide and far,
And every cloud illumed with flame
Engulfs a shaken star!

. . . . . .

Bright as comes morning from the hill,
There comes a face to her lover's eyes;
Her love she tells, and he dying smiles,—
And smiles yet in the skies.

He is dead, and closer breathe the mists;
He is dead, the owlet moans remote;
He is buried, and the moon draws near,
To gaze and hide and float.

Fearless within the churchyard's spell
The white-browed lady doth stand and sigh;
She loves the mist, and the grave, and the moon,
And the owl's quivering cry.

Rose Hawthorne Lathrop.

POMONA'S DAUGHTER.*

In the pretty walk, bordered by bright flowers and low, overhanging shrubbery, which lies back of the Albert Memorial, in Kensington Gardens, London, Jonas sat on a green bench, with his baby on his knee. A few nurses were pushing baby-carriages about in different parts of the walk, and there were children playing not far away. It was drawing toward the close of the afternoon, and Jonas was thinking it was nearly time to go home, when Pomona came running to him from the gorgeous monument, which she had been carefully inspecting.

"Jone," she cried, "do you know I've been lookin' at all them great men that's standin' round the bottom of the monnyment, an' though there's over a hundred of 'em, I'm sure, I can't find a American among 'em! There's poets, an' artists, an' leadin' men, scraped up from all parts, an' not one of our illustrious dead. What d'ye think of that?"

"I can't believe it," said Jonas. "If we go home with a tale like that we'll hear the recruiting-drum from Newark to Texas, and, ten to one, I'll be drafted."

"You needn't be makin' fun," said Pomona; "you come an' see for yourself. Perhaps you kin' find jus' one American, an' then I'll go home satisfied."

"All right," said Jonas.

And, putting the child on the bench, he told her he'd be back in a minute, and hurried after Pomona to give a hasty look for the desired American.

Corinne, the offspring of Jonas and Pomona, had some peculiarities. One of these was that she was accustomed to stay where she was put. Ever since she had been old enough to be carried about, she had been carried about by one parent or the other; and, as it was frequently necessary to set her down, she had learned to sit and wait until she was taken up again. She was now nearly two years old, very strong and active, and of an intellect which had already begun to tower. She could walk very well, but Jonas took such delight in carrying her that he seldom appeared to recognize her ability to use her legs. She could also talk, but how much her parents did not know. She was a taciturn child, and preferred to keep her thoughts to herself, and, although she sometimes astonished us all by imitating remarks she had heard, she frequently declined to repeat the simplest words that had been taught her.

Corinne remained on the bench about a minute after her father had left her, and then, contrary to her usual custom, she determined to leave the place where she had been put. Turning over on her stomach, after the manner of babies, she lowered her feet to the ground. Having obtained a foothold, she turned herself about and proceeded, with sturdy steps, to a baby-carriage near by which had attracted her attention. This carriage, which was unattended, contained a baby, somewhat smaller and younger than Corinne, who sat up and gazed with youthful interest at the visitor who stood by the side of her vehicle. Corinne examined, with a critical eye, the carriage and its occupant. She looked at the soft pillow at the baby's back, and regarded with admiration the afghan crocheted in gay colors which was spread over its lap, and the spacious gig-top which shielded it from the sun. She stooped down and looked at the wheels, and stood up and gazed at the blue eyes and canary hair of the little occupant. Then, in quiet but decided tones, Corinne said:

"Dit out!"

The other baby looked at her, but made no movement to obey. After waiting a few moments, an expression of stern severity spreading itself the while over her countenance, Corinne reached over and put her arms around the fair-haired child. Then, with all her weight and strength, she threw herself backward and downward. The other baby, being light, was thus drawn bodily out of its carriage, and Corinne sat heavily upon the ground, her new acquaintance sprawling in her lap. Notwithstanding that she bore the brunt of the fall upon the gravel, Corinne uttered no cry; but, disengaging herself from her incumbrance, she rose to her feet. The other baby imitated her, and Corinne, taking her by the hand, led her to the bench where she herself had been left.

"Dit up!" said Corinne.

This, however, the other baby was unable to do; but she stood quite still, evidently greatly interested in the proceedings. Corinne left her and walked to the little carriage, into which she proceeded to climb. After some extraordinary exertions, during which her fat legs were frequently thrust through the spokes of the wheels and ruthlessly drawn out again, she tumbled in. Arranging herself as comfortably as she knew how, she drew the gay

* See "The Rudder Grangers in England," THE CENTURY for January, 1883.

afghan over her, leaned back upon the soft pillow, gazed up at the sheltering gig-top, and resigned herself to luxurious bliss. At this supreme moment, the nurse who had had charge of the carriage and its occupant came hurrying around a corner of the path. She had been taking leave of some of her nurse-maid friends, and had staid longer than she had intended. It was necessary for her to take a suitable leave of these ladies, for that night she was going on a journey. She had been told to take the baby out for an airing, and to bring it back early. Now, to her surprise, the afternoon had nearly gone, and hurrying to the little carriage she seized the handle at the back and rapidly pushed it home, without stopping to look beneath the overhanging gig-top, or at the green bench, with which her somewhat worried soul had no concern. If anything could add to Corinne's ecstatic delight, it was this charming motion. Closing her eyes contentedly, she dropped asleep.

The baby with canary hair looked at the receding nurse and carriage with widening eyes and reddening cheeks. Then, opening her mouth, she uttered the cry of the deserted; but the panic-stricken nurse did not hear her, and, if she had, what were the cries of other children to her? Her only business was to get home quickly with her young charge.

About five minutes after these events, Jonas and Pomona came hurrying along the path. They, too, had staid away much longer than they had intended, and had suddenly given up their search for the American, whom they had hoped to find in high relief upon the base of the Albert Memorial. Stepping quickly to the child, who still stood sobbing by the bench, Jonas exclaimed: "You poor itty——!"

And then he stopped suddenly. Pomona also stood for a second, and then she made a dash at the child, and snatched it up. Gazing sharply at its tear-smeared countenance, she exclaimed: "What's this?"

The baby did not seem able to explain what it was, and only answered by a tearful sob. Jonas did not say a word; but, with the lithe quickness of a dog after a rat, he began to search behind and under benches, in the bushes, on the grass, here, there, and everywhere.

About nine o'clock that evening, Pomona came to us with tears in her eyes, and the canary-haired baby in her arms, and told us that Corinne was lost. They had searched everywhere; they had gone to the police; telegrams had been sent to every station; they had done everything that could be done, but had found no trace of the child.

"If I hadn't this," sobbed Pomona, holding out the child, "I believe I'd go wild. It isn't that she can take the place of my dear baby, but by a-keepin' hold of her I believe we'll git on the track of Corinne."

We were both much affected by this news, and Euphemia joined Pomona in her tears.

"Jonas is scourin' the town yet," said Pomona. "He'll never give up till he drops. But I felt you ought to know, and I couldn't keep this little thing in the night-air no longer. It's a sweet child, and its clothes are lovely. If it's got a mother, she's bound to want to see it before long; an' if ever I ketch sight of her, she don't git away from me till I have my child."

"It is a very extraordinary case," I said. "Children are often stolen, but it is seldom we hear of one being taken and another left in its place, especially when the children are of different ages, and totally unlike."

"That's so," said Pomona. "At first, I thought that Corinne had been changed off for a princess, or something like that, but nobody couldn't make anybody believe that my big, black-haired baby was this white-an'-yaller thing."

"Can't you find any mark on her clothes," asked Euphemia, "by which you could discover her parentage? If there are no initials, perhaps you can find a coronet or a coat of arms."

"No," said Pomona, "there aint nothin'. I've looked careful. But there's great comfort to think that Corinne's well stamped."

"Stamped!" we exclaimed. "What do you mean by that?"

"Why, you see," answered Pomona, "when Jone an' I was goin' to bring our baby over here among so many million people, we thought there might be danger of its gittin' lost or mislaid, though we never really believed any such thing would happen, or we wouldn't have come. An' so we agreed to mark her, for I've often read about babies bein' stole an' kept two or three years, an' when found bein' so changed their own mothers didn't know 'em. Jone said we'd better tattoo Corinne, for them marks would always be there, but I wouldn't agree to have the little creature's skin stuck with needles, not even after Jone said we might give her chloryform; so we agreed to stamp initials on her with Perkins's Indelible Dab. It is intended to mark sheep, but it don't hurt, and it don't never come off. We put the letters on the back of her heels, where they wouldn't show, for she's never to go barefoot, an' where they'd be easy got at if we wanted to find 'em. We put R. G. on one heel for the name of the place, and J. P. on the other heel for Jonas an' me. If, twenty years from

now," said Pomona, her tears welling out afresh, "I should see a young woman with eyes like Corinne's, an' that I felt was her, a-walkin' up to the bridal altar, with all the white flowers, an' the floatin' veils, an' the crowds in the church, an' the music playin', an' the minister all ready, I'd jist jerk that young woman into the vestry-room, an' have off her shoes an' stockin's in no time. An' if she had R. G. on one heel, an' J. P. on the other, that bridegroom could go home alone."

We confidently assured Pomona that with such means of identification, and the united action of ourselves and the police, the child would surely be found, and we accompanied her to her lodgings, in a house not far from our own.

When the nurse reached home with the little carriage it was almost dark, and, snatching up the child, she ran to the nursery without meeting any one. The child felt heavy, but she was in such a hurry she scarcely noticed that. She put it upon the bed, and then lighting the gas she unwrapped the afghan, in which the little creature was now almost entirely enveloped. When she saw the face, and the black hair, from which the cap had fallen off, she was nearly frightened to death, but, fortunately for herself, she did not scream. She was rather a stupid woman, with but few ideas, but she could not fail to see that some one had taken her charge, and put this child in its place. Her first impulse was to run back to the gardens, but she felt certain that her baby had been carried off; and, besides, she could not, without discovery, leave this child here or take it with her; and while she stood in dumb horror, her mistress sent for her. The lady was just going out to dinner, and told the nurse that, as they were all to start for the Continent by the tidal train, which left at ten o'clock that night, she must be ready with the baby, well wrapped up for the journey. The half-stupefied woman had no words nor courage with which to declare, at this moment, the true state of the case. She said nothing, and went back to the nursery and sat there in dumb consternation, and without sense enough to make a plan of any kind. The strange child soon awoke and began to cry, and then the nurse mechanically fed it, and it went to sleep again. When the summons came to her to prepare for the journey, in cowardly haste she wrapped the baby, so carefully covering its head that she scarcely gave it a chance to breathe; and she and the lady's waiting-maid were sent in a cab to the Victoria Station. The lady was traveling with a party of friends, and the nurse and the waiting-maid were placed in the adjoining compartment of the railway-carriage. On the six hours' channel passage from Newhaven to Dieppe the lady was extremely sick, and reached France in such a condition that she had to be almost carried on shore. It had been her intention to stop a few days at this fashionable watering-place, but she declared that she must go straight on to Paris, where she could be properly attended to, and, moreover, that she never wanted to see the sea again. When she had been placed in the train for Paris she sent for the nurse, and feebly asked how the baby was, and if it had been seasick. On being told that it was all right, and had not shown a sign of illness, she expressed her gratification, and lay back among her rugs.

The nurse and the waiting-maid traveled together, as before, but the latter, wearied by her night's attendance upon her mistress, slept all the way from Dieppe to Paris. When they reached that city, they went into the waiting-room until a carriage could be procured for them, and there the nurse, placing the baby on a seat, asked her companion to take care of it for a few minutes. She then went out of the station door, and disappeared into Paris.

In this way, the brunt of the terrible disclosure, which came very soon, was thrown upon the waiting-maid. No one, however, attached any blame to her: of course, the absconding nurse had carried away the fair-haired child. The waiting-maid had been separated from her during the passage from the train to the station, and it was supposed that in this way an exchange of babies had been easily made by her and her confederates. When the mother knew of her loss, her grief was so violent that for a time her life was in danger. All Paris was searched by the police and her friends, but no traces could be found of the wicked nurse and the fair-haired child. Money, which, of course, was considered the object of the inhuman crime, was freely offered, but to no avail. No one imagined for an instant that the exchange was made before the party reached Paris. It seemed plain enough that the crime was committed when the woman fled.

Corinne, who had been placed in the charge of a servant until it was determined what to do with her, was not at all satisfied with the new state of affairs, and loudly demanded her papa and mamma, behaving for a time in a very turbulent way. In a few days, the lady recovered her strength, and asked to see this child. The initials upon Corinne's heels had been discovered, and, when she was told of these, the lady examined them closely.

"The people who left this child," she ex-

claimed, "do not intend to lose her! They know where she is, and they will keep a watch upon her, and when they get a chance they will take her. I, too, will keep a watch upon her, and when they come for her I shall see them."

Her use of words soon showed Corinne to be of English parentage, and it was generally supposed that she had been stolen from some travelers, and had been used at the station as a means of giving time to the nurse to get away with the other child.

In accord with her resolution, the grief-stricken lady put Corinne in the charge of a trusty woman, and, moreover, scarcely ever allowed her to be out of her sight.

It was suggested that advertisement be made for the parents of a child marked with R. G. and J. P. But to this the lady decidedly objected.

"If her parents find her," she said, "they will take her away, and I want to keep her till the thieves come for her. I have lost my child, and as this one is the only clew I shall ever have to her, I intend to keep it. When I have found my child, it will be time enough to restore this one."

Thus selfish is maternal love.

Pomona bore up better under the loss than did Jonas. Neither of them gave up the search for a day; but Jonas, haggard and worn, wandered aimlessly about the city, visiting every place into which he imagined a child might have wandered, or might have been taken, searching even to the crypt in the Guildhall and the Tower of London. Pomona's mind worked quite as actively as her husband's body. She took great care of "Little Kensington," as she called the strange child, from the place where she had been found; and therefore could not go about as Jonas did. After days and nights of ceaseless supposition, she had come to the conclusion that Corinne had been stolen by opera singers.

"I suppose you never knew it," she said to us, "for I took pains not to let it disturb you, but that child has notes in her voice about two stories higher than any operer prymer donner that I ever heard, an' I've heard lots of 'em, for I used to go into the top gallery of the operer as often as into the theayter; an' if any operer singer ever heard them high notes of Corinne's,—an' there was times when she'd let 'em out without the least bit of a notice,—it's them that's took her."

"But, my poor Pomona," said Euphemia, "you don't suppose that little child could be of any use to an opera singer; at least, not for years and years."

"Oh, yes, ma'am," replied Pomona; "she was none too young. Sopranners is like mocking-birds; they've got to be took young."

No arguments could shake Pomona's belief in this theory. And she daily lamented the fact that there was no opera in London at that time that she might go to the performances, and see if there was any one on the stage who looked mean enough to steal a child.

"If she was there," said Pomona, "I'd know it. She'd feel the scorn of a mother's eye on her, an' her guilty heart would make her forget her part."

Pomona frequently went into Kensington Gardens, and laid traps for opera singers who might be sojourning in London. She would take Little Kensington into the gardens, and, placing her carefully in the corner of a bench, would retire to a short distance and pretend to be absorbed in a book, while her sharp eyes keep up the watch for a long-haired tenor, or a beautifully dressed soprano, who should suddenly rush out from the bushes and seize the child.

"I wouldn't make no fuss if they was to come out," she said. "Little Kensington would go under my arm, not theirn, an' I'd walk calmly with 'em to their home. Then I'd say: 'Give me my child, an' take yourn, which, though she probably hasn't got no voice, is a lot too good for you; an' may the house hurl stools at you the next time you appear, is the limit of a mother's curse."

But, alas for Pomona, no opera singers ever showed themselves.

These days of our stay in London were not pleasant. We went about little, and enjoyed nothing. At last Pomona came to us, her face pale but determined.

"It's no use," she said, "for us to keep you here no longer, when I know you've got through with the place, and want to go on, an' we'll go, too, for I don't believe my child's in London. She's been took away, an' we might as well look for her in one place as another. The perlice tells us that if she's found here they'll know it fust, an' they'll telegraph to us wherever we is; an' if it wasn't for nuthin' else, it would be a mercy to git Jone out of this place. He goes about like a cat after her drowned kittens. It's a-bringin' out them chills of hisn, an' the next thing it'll kill him. I can't make him believe in the findin' of Corinne as firm as I do, but I know as long as Perkins's Indelible Dab holds out (an' there's no rubbin' nor washin' it off) I'll git my child."

I admitted, but not with Pomona's hopefulness, that the child might be found as easily in Paris as here.

"And we've seen everything about Lon-

don," said Euphemia, "except Windsor Castle. I did want, and still want, to see just how the Queen keeps house, and perhaps get some ideas which might be useful; but Her Majesty is away now, and, although they say that's the time to go there, it is not the time for me. You'll not find me going about inspecting domestic arrangements when the lady of the house is away."

So we packed up and went to Paris, taking Little Kensington along. Notwithstanding our great sympathy with Corinne's parents, Euphemia and myself could not help becoming somewhat resigned to the affliction which had befallen them, and we found ourselves obliged to enjoy the trip very much. Euphemia became greatly excited and exhilarated as we entered Paris. For weeks I knew she had been pining for this city. As she stepped from the train she seemed to breathe a new air, and her eyes sparkled as she knew by the prattle and cries about her that she was really in France.

We were obliged to wait some time in the station before we could claim our baggage, and while we were standing there Euphemia drew my attention to a placard on the wall. "Look at that!" she exclaimed. "Even here, on our very entrance to the city, we see signs of that politeness which is the very heart of the nation. I can't read the whole of that notice from here, but those words in large letters show that it refers to the observance of the ancient etiquettes. Think of it! Here in a railroad station people are expected to behave to each other with the old-time dignity and gallantry of our forefathers. I tell you it thrills my very soul to think I am among such a people, and I am glad they can't understand what I say, so that I may speak right out."

I never had the heart to throw cold water on Euphemia's noble emotions, and so I did not tell her that the notice merely requested travelers to remove from their trunks the *anciennes étiquettes*, or old railway labels.

We were not rich tourists, and we all took lodgings in a small hotel to which we had been recommended. It was in the Latin Quarter, near the river, and opposite the vast palace of the Louvre, into whose labyrinth of picture-galleries Euphemia and I were eager to plunge.

But first we all went to the office of the American Consul, and consulted with him in regard to the proper measures to be taken for searching for the little Corinne in Paris. After that, for some days, Jonas and Pomona spent all their time, and Euphemia and I part of ours, in looking for the child. Euphemia's Parisian exhilaration continued to increase, but there were some things that disappointed her.

"I thought," said she, "that people in France took their morning coffee in bed, but they do not bring it up to us."

"But, my dear," said I, "I am sure you said before we came here that you considered taking coffee in bed as an abominable habit, and that nothing could ever make you like it."

"I know," said she, "that I have always thought it a lazy custom, and not a bit nice, and I think so yet. But still, when we are in a strange country, I expect to live as the other people do."

It was quite evident that Euphemia had been looking forward for some time to the novel experience of taking her coffee in bed. But the gray-haired old gentleman who acted as our chambermaid, never hinted that he supposed we wanted anything of the kind.

Nothing, however, excited Euphemia's indignation so much as the practice of giving a *pourboire* to cabmen and others. "It is simply feeding the flames of intemperance," she said. When she had occasion to take a cab by herself, she never conformed to this reprehensible custom. When she paid the driver, she would add something to the regular fare, but as she gave it to him she would say in her most distinct French: "*Pour manger. Comprenez-vous?*" The *cocher* would generally nod his head, and thank her very kindly, which he had good reason to do, for she never forgot that it took more money to buy food than drink.

In spite of the attractions of the city, our sojourn in Paris was not satisfactory. Apart from the family trouble which oppressed us, it rained nearly all the time. We were told that in order to see Paris at its best we should come in the spring. In the month of May it was charming. Then everybody would be out-of-doors, and we would see a whole city enjoying life. As we wished to enjoy life without waiting for the spring, we determined to move southward, and visit during the winter those parts of Europe which then lay under blue skies and a warm sun. It was impossible, at present, for Pomona and Jonas to enjoy life anywhere, and they would remain in Paris, and then, if they did not find their child in a reasonable time, they would join us. Neither of them understood French, but this did not trouble them in the slightest. Early in their Paris wanderings they had met with a boy who had once lived in New York, and they had taken him into pay as an interpreter. He charged them a franc and a half a day, and I am sure they got their money's worth.

Soon after we had made up our minds to

move toward the south, I came home from a visit to the bankers, and joyfully told Euphemia that I had met Baxter.

"Baxter?" said she, inquiringly, "who is he?"

"I used to go to school with him," I said; "and to think that I should meet him here!"

"I never heard you mention him before," she remarked.

"No," I answered; "it must be fifteen or sixteen years since I have seen him, and really it is a great pleasure to meet him here. He is a capital fellow. He was very glad to see me."

"I should think," said Euphemia, "if you like each other so much that you would have exchanged visits in America, or, at least, have corresponded."

"Oh, it is a very different thing at home," I said; "but here it is delightful to see an old school friend like Baxter. He is coming to see us this evening."

That evening Baxter came. He was delighted to meet Euphemia, and inquired with much solicitude about our plans and movements. He had never heard of my marriage, and, for years, had not known whether I was dead or alive. Now he took the keenest interest in me and mine. We were a little sorry to find that this was not Baxter's first visit to Europe. He had been here several times; and, as he expressed it, "had knocked about a good deal over the Continent." He was dreadfully familiar with everything, and talked about some places we were longing to see in a way that considerably dampened our enthusiasm. In fact, there was about him an air of superiority which, though tempered by much kindliness, was not altogether agreeable. He highly approved our idea of leaving Paris. "The city is nothing now," he said. "You ought to see it in May." We said we had heard that, and then spoke of Italy. "You mustn't go there in the winter," he said. "You don't see the country at its best. May is the time for Italy. Then it is neither too hot nor too cold, and you will find out what an Italian sky is." We said that we hoped to be in England in the spring, and he agreed that we were right there. "England is never so lovely as in May."

"Well!" exclaimed Euphemia, "it seems to me, from all I hear, that we ought to take about twelve years to see Europe. We should leave the United States every April, spend May in some one place, and go back in June. And this we ought to do every year until we have seen all the places in May. This might do very well for any one who had plenty of money, and who liked the ocean, but I don't think we could stand it. As for me," she continued, "I would like to spend these months, so cold and disagreeable here, in the sunny lands of Southern France. I want to see the vineyards and the olive groves, and the dark-eyed maidens singing in the fields. I long for the soft skies of Provençe, and to hear the musical dialect in which Frederic Mistral wrote his 'Miréio.'"

"That sounds very well," said Baxter, "but in all those southern countries you must be prepared in winter for the rigors of the climate. The sun is pretty warm sometimes at this season, but as soon as you get out of it you will freeze to death if you are not careful. The only way to keep warm is to be in the sun, out of the wind, and that wont work on rainy days, and winter is the rainy season, you know. In the houses it is as cold as ice, and the fires don't amount to anything. You might as well light a bundle of wooden tooth-picks and put it in the fire-place. If you could sleep all the time it might do very well, for they give you a feather-bed to cover yourself with. Outside you may do well enough if you keep up a steady walking, but indoors you will have hard work to keep warm. You must wear chest-protectors. They sell them down there — great big ones, made of rabbit-skins; and a nice thing for a man to have to wear in the house is a pair of cloth bags lined with fur. They would keep his feet and legs warm when he isn't walking. It is well, too, to have a pair of smaller fur bags for your hands when you are in the house. You can have a little hole in the end of one of them through which you can stick a pen-holder, and then you can write letters. An india-rubber bag, filled with hot water, to lower down your back, is a great comfort. You haven't any idea how cold your spine gets in those warm countries. And, if I were you, I'd avoid a place where you see them carting coal stoves around. Those are the worst spots. And you need not expect to get one of the stoves, not while they can sell you wood at two sticks for a franc. You had better go to some place where they are not accustomed to having tourists. In the regular resorts they are afraid to make any show of keeping warm, for fear people will think they are in the habit of having cold weather. And in Italy you've got to be precious careful, or you'll be taken sick. And another thing. I suppose you brought a great deal of baggage with you. You, for instance," said our friend, turning to me, "packed up, I suppose, a heavy overcoat for cold weather, and a lighter one, and a good winter suit, and a good summer one, besides another for spring and fall, and an old suit to lie about in in the orange groves, and a dress suit, besides such convenient articles

as old boots for tramping in, shut-up lanterns, and so forth.

Strange to say I had all these, besides many other things of a similar kind, and I could not help admitting it.

"Well," said Baxter, "you'd better get rid of the most of that as soon as you can, for if you travel with that sort of heavy weight in the Mediterranean countries, you might as well write home and get your house mortgaged. All along the lines of travel, in the south of Europe, you find the hotels piled up with American baggage left there by travelers, who'll never send for it. It reminds one of the rows of ox skeletons that used to mark out the roads to California. But I guess you'll be able to stick it out. Good-bye. Let me hear from you."

When Baxter left us, we could not but feel a little down-hearted, and Euphemia turned to her guide-book to see if his remarks were corroborated there.

"Well, there is one comfort," she exclaimed at last, "this book says that in Naples epidemics are not so deadly as they are in some other places, and if the traveler observes about a page of directions, which are given here, and consults a physician the moment he feels himself out of order, it is quite possible to ward off attacks of fever. That is encouraging, and I think we might as well go on."

"Yes," said I, "and here, in this newspaper, a hotel in Venice advertises that its situation enables it to avoid the odors of the Grand Canal; and an undertaker in Nice advertises that he will forward the corpses of tourists to all parts of Europe and America. I think there is a chance of our getting back, either dead or alive, and so I also say, let us go on."

But before we left Paris, we determined to go to the Grand Opera, which we had not yet visited, and Euphemia proposed that we should take Pomona with us. The poor girl was looking wretched and woe-begone, and needed to have her mind diverted from her trouble. Jonas, at the best of times, could not be persuaded to any amusement of this sort, but Pomona agreed to go. We had no idea of dressing for the boxes, and we took good front seats in the upper circle, where we could see the whole interior of the splendid house. As soon as the performance commenced, the old dramatic fire began to burn in Pomona. Her eyes sparkled as they had not done for many a day, and she really looked like her own bright self. The opera was "Le Prophète," and, as none of us had ever seen anything produced on so magnificent a scale, we were greatly interested, especially in the act which opens with that wonderful winter scene in the forest, with hundreds of people scattered about under the great trees, with horses and sleighs and the frozen river in the background where the skaters came gliding on. The grouping was picturesque and artistic; the scale of the scene was immense; there was a vast concourse of people on the stage; the dances were beautiful; the merry skaters graceful; the music was inspiring.

Suddenly, above the voices of the chorus, above the drums and bass strings of the orchestra, above the highest notes of the sopranos, above the great chandelier itself, came two notes distinct and plain, and the words to which they were set, were:

"Ma-ma!"

Like a shot Pomona was on her feet. With arms outspread and her whole figure dilating until she seemed twice as large as usual, I thought she was about to spring over the balcony into the house below. I clutched her, and Euphemia and I, both upon our feet, followed her gaze and saw upon the stage a little girl in gay array, and upturned face. It was the lost Corinne.

Without a word, Pomona made a sudden turn, sprang up the steps behind her, and out upon the lobby, Euphemia and I close behind her. Around and down the steps we swept, from lobby to lobby, amazing the cloak-keepers and attendants, but stopping for nothing; down the grand staircase like an avalanche, almost into the arms of the astonished military sentinels, who, startled from their soldier-like propriety, sprang, muskets in hand, toward us. It was only then that I was able to speak to Pomona, and breathlessly ask her where she was going.

"To the stage-door!" she cried, making a motion to hurl to the ground the soldier before her. But there was no need to go to any stage-door. In a moment there rushed along the corridor, a lady dressed apparently in all the colors of the rainbow, and bearing in her arms a child. There was a quick swoop, and in another moment Pomona had the child. But clinging to its garments, the lady cried, in excellent English but with some foreign tinge:

"Where is my child you stole?"

"Stole your grandmother!" briefly ejaculated Pomona. And then, in grand forgetfulness of everything but her great joy, she folded her arms around her child, and standing like a statue of motherly content she seemed, in our eyes, to rise to the regions of the caryatides and the ceiling frescoes. Not another word she spoke, and amid the confusion of questions and exclamations, and

the wild demands of the lady, Euphemia and I contrived to make her understand the true state of the case, and that her child was probably at our lodgings. Then there were great exclamations and quick commands; and, directly, four of us were in a carriage whirling to our hotel. All the way, Pomona sat silent with her child clasped tightly, while Euphemia and I kept up an earnest but unsatisfactory conversation with the lady; for, as to this strange affair, we could tell each other but little. We learned from the lady, who was an assistant soprano at the Grand Opera, how Corinne came to her in Paris, and how she had always kept her with her, even dressing her up, and taking her on the stage in that great act where as many men, women, and children as possible were brought upon the scene. When she heard the cry of Corinne, she knew the child had seen its mother, and then, whether the opera went on or not, it mattered not to her.

When the carriage stopped, the three women sprang out at once, and how they all got through the door, I cannot tell. There was such a tremendous ring at the gate of the court that the old *concierge*, who opened it by pulling a wire in his little den somewhere in the rear, must have been dreadfully startled in his sleep. We rushed through the court and up the stairs past our apartments to Pomona's room; and there in the open door-way stood Jonas, his coat off, his sandy hair in wild confusion, his face radiant, and in his hands Little Kensington in her night-gown.

"I knew by the row on the stairs you'd brought her home," he exclaimed, as Little Kensington was snatched from him and Corinne was put into his arms.

We left Jonas and Pomona to their wild delight, and I accompanied the equally happy lady to the opera house, where I took occasion to reclaim the wraps which we had left behind in our sudden flight.

When the police of Paris were told to give up their search for an absconding nurse accompanied by a child, and to look for one without such incumbrance, they found her. From this woman was obtained much of the story I have told, and a good deal more was drawn out, little by little, from Corinne, who took especial pleasure in telling, in brief sentences, how she had ousted the lazy baby from the carriage, and how she had scratched her own legs in getting in.

"What I'm proud of," said Pomona, "is that she did it all herself. It wasn't none of your common stealin's an' findin's; an' it aint everywhere you'll see a child that kin git itself lost back of Prince Albert's monnyment, an' git itself found at the operer in Paris, an' attend to both ends of the case itself. An', after all, them two high notes of hern was more good than Perkins's Indelible Dab."

Frank R. Stockton.

ANTIQUITY.

He spoke to us of Egypt in her prime;
  He showed us pictures of the rock-hewn kings
  And Memnon's hoary bulk, that no more sings
  His greeting to the morning sun. The time
Slipped back through thirty centuries, dim with rime
  And mist that veils the dawn of human things,
  Until we felt the awe the great past brings
  To us who dwell in this unstoried clime.

And then he paused and turned; the night was torn
  With flying clouds, but once, there gleamed a star,—
  A single sun of all the heavenly band;
And he, "Lo! that dim light saw Egypt born;
  Before it, all earth's ages moments are,
  And all her greatness but a grain of sand."

James Sanderson.

MY ADVENTURES IN ZUÑI. III.

"The rattled-tailed serpents
Have gone into council;
For the god of the Ice-caves,
From his home where the white down
Of wind in the north-land
Lies spread out forever,
Breathes over our country
And breaks down the pine-boughs."*

THUS say the grandfathers of Zuñi children when the snow-storms whiten the distant mountains and mesas. Next to autumn, winter is the merriest season of the year; merry to the lazy Indians, because a time of rest, festivity, and ceremonial. There is not much to be done; only the wood to be gathered from the mesas and cañons and brought in on "burro-back," the herds to be looked after, and the snow, when it happens to get piled up on the terraces, to be shoveled with wooden spades into blankets, and carried on the head down ladders to the outer edge of the pueblo, and there banked against the corrals. The days, save when some national observance claims the time, or betting over elaborate games in the plazas runs high, are dreary and monotonous enough; but the firelit evenings lengthen into hours of merry conversation. Old gray-heads sit around the hearths, telling their children of the adventures of men and the gods "when the world was young in the days of the new."

When the new-year of 1880 brought such times as these, I had been four months in Zuñi, and was counted one of the Children of the Sun. As I strolled through the streets or over the house-tops, children stopped pelting dogs with snow-balls, or playing checkers with bits of pottery on flat stones, and shouted my new name, "Te-na-tsa-li! Te-na-tsa-li!" at the tops of their shrill little voices. I was able, too, to share somewhat in the conversations and councils of the older ones; no longer did the cigarette of my "brother," the old governor of the tribe, gleam alone when the blazes on the hearth shrank back into the red embers, leaving only the shadows of the night in my little room. No; a dozen red stars glowed and perished with every whiff of as many eager visitors, or burned in concert at the end of each joke or story, revealing strange features which started forth from the darkness, like the ruddy ghosts of some pre-Columbian decade. "Shake the blazes out of the brands," one of these ghosts would say; and another, with a long cedar stick, would poke the brands, till the flames would dart up the black chimney anew, the cigarette stars would fade into ashes in the sunlight of the piñon, when lo! the ancient ghosts became sprawling, half-nude Indians again.

No sooner had I begun to enjoy these evening diversions of the pueblo home than they were interrupted for several days. I then first learned of the existence of thirteen orders or societies, some of which were actually esoteric, others of a less strict nature, but all most elaborately organized and of definitely graded rank, relative to one another. For the introduction here of a few words relative to these organizations, I beg the pardon of the reader; since their existence is a fact of ethnologic importance, and moreover my statements relative to them have been most acrimoniously criticised and persistently disputed.

Functionally they are divisible into four classes: Those of War, of the Priesthood, of Medicine, and of the Chase; yet the elements of every one of these classes may be traced in each of all the others.

Of the first class (Martial) there is but one society — the "A-pi-thlan-shi-wa-ni," or the "Priests of the Bow," at once the most powerful and the most perfectly organized of all native associations, in some respects resembling the Masonic order, being strictly secret or esoteric; it is possessed of twelve degrees, distinguished by distinctive badges.

Of the second class (Ecclesiastical) there is also but one order — the "Shi-wa-ni-kwe," or society of priests, of the utmost sacred importance, yet less strictly secret than the first.

Of the third class (Medical) are the "Kashi-kwe" and "A-tchi-a-kwe," or cactus and knife orders — the martial and civil surgeons of the nation; the "Ne-we-kwe" and "Thle-we-kwe," or the gourmands and stick-swallowers; "Bearers of the Wand," who treat diseases of the digestive system; the "Ka-

* An almost literal translation from a Zuñi folk-lore tale of winter.

ka-thla-na-kwe" and "Ma-ke-thla-na-kwe," or grand ka-ka (dance) and grand fire orders, who treat inflammatory diseases; the "Ma-ke-tsa-na-kwe" and "Pe-sho-tsi-lo-kwe," or the lesser fire and insect orders, who treat burns, ulcers, cancers, and parasitic complaints; the "U-hu-hu-kwe," or "Ahem" (cough) order, who treat colds, etc.; and lastly, the "Tchi-to-la-kwe," or rattlesnake order, who treat the results of poisoning, actual or supposed, resulting from sorcery or venomous wounds.

Of the fourth class (Hunters) there is again but one order — the "San-ia-k'ia-kwe," or "Tus-ki-kwe," blood or coyote order — the hunters of the nation.

To all these a fourteenth organization might be added, were it not too general to be regarded as esoteric, notwithstanding its operations are strictly secret and sacred. I refer to the much quoted, misspelled, and otherwise abused "Ka-ka," "the Dance," which is wonderfully perfect in structure, and may be regarded as the national church, and, like the church with ourselves, is rather a sect than a society.

Perhaps the Priesthood of the Bow is the only truly esoteric of all these bodies, since members of it may be admitted to meetings of all the others, while members of the other societies are strictly excluded from the meetings of this.

Early learning this, I strove for nearly two years to gain membership in it, which would secure at once standing with the tribe and entrance to all sacred meetings, as well as eligibility to the Head Chieftaincies. I succeeded, and the memory of my experiences in this connection are to me the most interesting chapter of my Zuñi life.

These orders were engaged in their annual ceremonials, of which little was told or shown me; but, at the end of four days, I heard one morning a deep whirring noise. Running out, I saw a procession of three priests of the bow, in plumed helmets and closely-fitting cuirasses, both of thick buckskin,— gorgeous and solemn with sacred embroideries and war-paint, begirt with bows, arrows, and war-clubs, and each distinguished by his badge of degree,— coming down one of the narrow streets. The principal priest carried in his arms a wooden idol, ferocious in aspect, yet beautiful with its decorations of shell, turquois, and brilliant paint. It was nearly hidden by symbolic slats and prayer-sticks most elaborately plumed. He was preceded by a guardian with drawn bow and arrows, while another followed, twirling the sounding slat which had attracted alike my attention and that of hundreds of the Indians, who hurriedly flocked to the roofs of the adjacent houses or lined the street, bowing their heads in adoration, and scattering sacred prayer-meal on the god and his attendant priests. Slowly they wound their way down the hill, across the river, and off toward the mountain of Thunder. Soon an identical procession followed and took its way toward the western hills. I watched them long until they disappeared, and a few hours afterward there arose from the top of "Thunder Mountain" a dense column of smoke, simultaneously with another from the more distant western mesa of "U-ha-na-mi," or "Mount of the Beloved."

Then they told me that for four days I must neither touch nor eat flesh or oil of any kind, and for ten days neither throw any refuse from my doors, nor permit a spark to leave my house, for "This was the season of the year when the 'grandmother of men' (fire) was precious."

Since my admission to the Priesthood of tne Bow, I have been elected to the office of guardian to these gods; have twice accompanied them to their distant lofty shrines, where, with many prayers, chants, and invocations, they are placed in front of their predecessors of centuries' accumulation. Poetic in name and ascribed nature are these cherished and adored gods of war: one is called "A-hai-iu-ta," and the other "Ma-tsai-le-ma," and they are believed to be single in spirit, yet dual in form, the child or children of the God of the Sun, and to guard from year to year, from sunrise to sunset, the vale and children of those they were first sent to redeem and guide. These children receive without question the messages interpreted by their priests from year to year, which unfailingly shape the destinies of their nation toward the "encircling cities of mankind."

When the fast was over and the nation had gladly thrown aside its yoke of restriction with the plumed sacrifices, which were cast into the river or planted on the sandy plain, the nightly sittings were again resumed in my little home. One night, at the pause of a long story, I heard a priest counting his fingers to fix the date of the ceremonials of initiation to be performed, he said, "by the rattlesnakes and fire-eaters." He lamented greatly the loss of some sacred black paint, with which he wished to decorate afresh the tablets of his altar, and was wondering what he would do about it. Conversation recurred to the stories, and I fell to thinking how I could turn the priest's difficulties to account. At last a plan struck me: I took from my trunk a book illustrated with colored prints and pretended to read it before the dim fire-light. As

I had designed, the curiosity of my companions was excited. Then I told them how the pictures had first been painted, and getting my water-color box, which contained some India ink, proceeded to illustrate what I had said. In describing how the colors were made, I dwelt particularly on the ink, saying that it was "made only by the *Chi-ni-kwe*, who were a Celestial people and lived on the back side of the world." I then painted with it a tablet of wood, and the deep black gloss excited their admiration. When I saw this, I hastened to add that "the *black* pigment was most precious; that they might use the other tints, but I could not part with that for an instant." At their usual late hour the company broke up. The priest, on leaving, looked longingly toward the corner wherein I had placed the box of paints, but said nothing. I awaited further developments most anxiously.

Four or five days later he came to me in company with one or two others. It was quite early in the day. As I had hoped, he asked for a "small piece of the Chi-ni-kwe ink." I refused it, repeating what I had already said. For a time he looked blank, but finally asked if I would not *lend* him some of it. Again I refused, saying "I could not trust it out of my sight." Finally, after much consultation with the others, he asked me if I "liked the Mexicans and other fools." I said "No"; then he begged that I should come to the "Chamber of the Rattlesnakes," and bring with me some of the "Chi-ni-kwe black." I purposely hesitated a long time, but finally said that "may-be" I would.

As soon as the embassy had departed, I made up a package of tobacco, candles, etc., with the black paint and an elaborate Chinese ink-stone. Near noon I took my way to the Chamber. I stepped down the ladder with perfect assurance, and observing that all the members were barefooted, drew my own moccasins off and went up to the front of the altar; at the same time speaking the greeting which had been taught me when I visited the "Ko-yi-ma-shi," I deposited the articles one by one, last of all the paint.

Had a ghost appeared in their midst he would not have caused more surprise than my assurance and seeming familiarity with the forms excited in the members of the order. They occupied one of the largest rooms in the town, along the walls of which were painted figures of the gods, among them a winged human monster with masked face, and a giant corn-plant which reached from floor to ceiling and was grasped on either side by a mythologic being. Toward the western end of the room stood the altar, with attendant priests before, behind, and on either side of it. Above all was suspended a winged figure, like the painting on the wall. Between the altar and the blazing hearth were gathered the members, all of whom, save the women, were nearly nude; but elaborate devices in red, white, and yellow paint, representing serpents, suns, and stars, made them appear dressed in skin-fitting costumes. They were at work grinding and mixing paint, adorning costumes, and cleaving blocks of straight-grained cedar into splints about a yard in length, and nearly as thin as grass straws. Others, again, were tying, with strips of "yucca" leaf, the splints thus prepared into bundles about as large as one's arm.

As soon as I had deposited the presents, I approached and saluted the chief-priest, grasped his hands with both my own, and telling him I would "return at evening for the paint," breathed on them and hastily withdrew. On my way home an Indian who had seen me enter cursed me heartily, and said I would suffer for my imprudence, but I paid no attention to him. He told my old brother, however, and when long after dark I threw my serape over my shoulders, the latter asked where I was going. I said "To see the rattlesnakes." "No!" said the old man. "Yes," said I; "if the priest be willing, why should *you* object?" and amid family imprecations I darted out of the door and hurried along the dark streets to the place of meeting. I climbed the ladder and entered, blinking at the flood of light with which the place was aglow. Several of the members started up and motioned me out with their flat hands; but I only breathed deeply from my own, until I reached the place of the old priest. Knowing that Mexican was forbidden, I pretended not to understand what was said, when the latter advised me, in his own language, to go home; on the contrary, I wrung his hand, and, as I pulled off my moccasins, incoherently expressed my thanks for the privilege of remaining, and immediately seated myself as if for the night. It was a heavy "game of bluff" but utterly bewildered by it, the old priest said nothing for some moments, until, evidently in despair, he lighted a cigarette, blew smoke into the air, uttered a prayer, and then handed the cigarette to me. I smoked a whiff or two, said a prayer in English, and handed the cigarette to the nearest member. I had the satisfaction of hearing them say, "Let him stay; he is no fool, and what if he be—he is our Ki-he, and the 'Beings' will throw the light of their favor upon him, because he cannot understand and knows no better." So they rolled another cigarette and told me I "must smoke all night, and help to make clouds for their little world"; that I "must occasionally give

to the fathers (priests and song-masters) my cigarettes, roll more, and never be idle, nor cease smoking." I had never smoked before. The first cigarette made me desperately sick; the second, sicker; so that, when I rose to present it, I reeled and had to sit down again; with the third, the sickness disappeared, and with the fourth I first came to feel the dreamy pleasures of the smoker.

At midnight, a long succession of cries like the voices of strange night-birds penetrated our smoky den. The musicians began to beat their great drum and sing a weird, noisy song, celebrating the origin of their order. Soon a grand company of dancers filed in, costumed like the members of the Rattlesnake order, save that black streaks of paint encircled their mouths, bordered and heightened by lines and daubs of yellow pigment. After passing through a rapid dance, which was attended by the round-headed "Sa-la-mo-pi-a," they settled down along the opposite side of the room. Only the "Sa-la-mo-pi-a" now remained, dancing wildly up and down before the altar, waving his wand of yucca and willow, with which, on occasion, he soundly thrashed the unfortunate sleepers whom his keen little round eyes failed not to discover.

There was now a sudden pause in the music. The Sa-la-mo-pi-a retired, and only members of the two orders remained. Two lads who were undergoing their novitiate, were brought into the middle of the room. The fires and huge grease lamps were freshly kindled and lighted, until the smoke near the ceiling looked almost like the clouds of sunset. A nude functionary brought great armfuls of the splint bundles, and deposited them in front of the hearth. The music struck up —wilder, more mysterious and deafening than ever. The two boys looked wistfully about; one trembled visibly, while the other, more imbued with the spirit of his race, seemed possessed, after the first movements, with a dogged apathy. Two members of the order approached them from behind, pinioned their arms, and stood holding them. All the other members rose, each procured a bundle of the splints, breathed on it, prayed over it, and all, save the leading priests, sat down again; these set up long, terrific cries, rushed toward the fire, howled at it as if in defiance, and stuffed the ends of the splints into the flames and embers. Soon their torches set the place more aglow than ever. They approached the terrified boys, danced, and joined in the wild song, brandishing their flambeaux, and yelling more and more vociferously. Suddenly, two by two, they stepped into the light, thrust the blazing splints into their mouths and throats, drew them forth still aglow with coals, and put the latter out in the mouths of the boys. The stoic stood unmoved, but the other writhed and turned his head piteously; to no purpose, however, for the stalwart priests held him firmly to the fiery ordeal. Two by two, all the members in order of their rank, even the song-masters, went through this process, until just before day-break there remained only the prayers to be said over the wretched pair to complete their initiation. This completed they were conducted to seats, and all present said their prayers before the altar; meal was thrust into my hand and I was dragged up with the rest. A long silence ensued. Sleepy participants nodded, grimaced, fell against one another, re-straightened up, only to repeat again and again the same experience, before daylight sifted in and sunbeams followed through the holes in the blanket curtains. Finally, a woman's voice called down from the roof. One by one she passed down huge bowls of meat broth, red with chili, guava and Indian delicacies, until four rows extended from the end of the room to the altar. She then came in accompanied by a plumed priest of another order; together they said a prayer of presentation, which the priests present replied to with one of thanksgiving. The "bad influence" of the feast was skimmed off with eagle plumes and "thrown up" the altar by a medicine priest. Then the leader called out, "Eat all!" The weary crowd woke up of one accord, and with boisterous jokes, loud smacking, and gurgling exclamations of satisfaction, soon cleared away a good portion of the liberal feast. A bowl of hot broth and meat was set before the novices. It was red with pepper, powder, or chili. They took a mouthful each, and with tears in their eyes desisted, for their lips were as black with cinders as their tongues were white with blisters, but they were bidden to eat. The more timid one refusing was grasped by the nape of the neck by one priest, while another stuffed the hot smoking food down his throat.

Horrible as are these ordeals, they are less so than those of the Cactus order, where the young candidate is scourged with willow wands and cactus thorns, until his naked body is covered with a net-work of ridges and punctures. Far from blaming my foster-people for these things, I look rather to the spirit of their at first imposed, but afterward voluntary sufferings, that they may place themselves beyond the evil they strive to overcome in others; may strengthen the faith of their patients to the sublime power of their medicines, given, they aver, by the gods themselves for the relief of suffering humanity. So, annually, they and their brother orders

give public exhibitions of their various powers—sometimes, as is the case with the slat swallowers (or "Bearers of the Wand"), producing injuries for life, or even suffering death; but, nevertheless unflinchingly, year after year, performing their excruciating rites.

When all was over I followed the little ray of golden sunshine, which shot down through the neat covering of the sky-hole, up the slanting ladder and out into the cold winter morning air. A chill seized me before I had reached my little room. Several Indians who noticed my pallor attributed it to my transgressions. They were not long in communicating their thoughts to my old brother, who lamented having allowed me to go. As days passed I grew little better, and a few colds—the result of my scant costume and almost constantly damp, cold feet—at last prostrated me with pneumonia. When I began to recover, I was for weeks almost confined to my room. A walk across the pueblo would exhaust me. During this long illness and convalescence, I was constantly attended by my old brother and K'ia-wu ("sister"). My hammock was once more brought out and strung, and I was allowed more blankets. An almost constant crowd of visitors assembled during the day in my little room, leaving only with the late hours of night. They kept up a steady conversation, and I determined to improve the time by studies of the language. My old brother was delighted. Hour after hour he would sit by my bedside, drilling me in pronunciation and compelling me to say, over and over, the hard new words which he continually produced and explained for my benefit.

I now began to learn that the language spoken by my foster-people is by no means either meager or crude. It has most of the cases, moods, and tenses of the Greek, and like it possessed the singular, dual-plural, plural, and collective-plural numbers. It abounds in synonyms. For instance, the word *much* or *many* is expressed by no fewer than three words: *Em-ma*, *te-u-tcha*, *ko-ho-ma-sho-ko*. For our verb *to know*, five expressions occur, strikingly delicate in their distinctive shades of meaning. *To know*—intentively or abstractly, self-evident knowledge, *ai-yu-ya-na; to know* through the understanding, acquired knowledge, *iu-he-ta; to know*—how to act, speak, think, do or make anything,—methodic knowledge, *an-i-kwa; to know*—a country, road, river, mountain, or place—geographic knowledge, *te-na-di; to know*—a place, person, animal, or personified object—knowledge of acquaintance, *a-na-pi*. Each of these expressions is again capable of modification by grammatic prefixes, suffixes, or interjections; so that more than fifteen almost distinct terms for the one English verb, *to know*, can be produced. Nor are these refinements of meaning limited to this one example; they extend through the whole range of verbs, adverbs, and adjectives of the language. I was at first overwhelmed; but my old brother so invariably pounced upon a wrong use of any apparent synonym, that I soon overcame the difficulty.

To get used to the proper number, however, was not so easy. A friend's face would smile in at my open door. I would say *Kwa-ta* (Come in). He would thank me and obey instantly. Three or four, old and young, would appear; I would address them in the same way. They would look at one another and then at me, and finally begin a discussion as to which of their number I had meant. My old brother would look up and remark *U-kwa-ta*. They would troop in, and he would rate me soundly before them all for such a blunder. But if it happened that two appeared at the door, and I repeated the plural expression, they would unfailingly look over their shoulders as though they expected some one else to follow. Then the old man would laugh at me, swear a little, and call out "*Atch-kwa-ta*." Imagine my surprise when I thought I had mastered these distinctions to find myself yet again sharply rebuked by my old teacher. Several dancers came to my door-way. I said *U-kwa-ta;* they looked offended. "*An*-samu-kwa-ta," said my old brother; the looks vanished before smiles at my ignorance, and my brother explained that they all belonged to "one class" *(ta-nan-ne)*.

He trained me diligently in another peculiarity of his speech. A man may say for "I want" *ha-anti-shi-ma*, but he must not say *ha-kwa-anti-shi-ma* for "I do not want." He must say *kwa* (not) *ha* (I) *anti-shi-ma* (want) *nam-me*, negative ending. "Good" was *k'ok-shi;* "not good," *kwa-k'ok-sham-me;* and this double negative was a sore perplexity, especially when *Kwa* initiated a long sentence and the negative ending was added to each subject verb or adverb as well as to the close of the whole sentence. After I had gained an insight into case, mood, and tense, endings, prefixes, and interjections, my progress was more rapid. The tenses presented the greatest obstacle. One night I went to bed rather discouraged. I dreamed of having gained a clear conception of the tenses (which probably resulted from my long thinking on the subject), and of speaking at great length many of the roots I already knew, with their *proper* prefixes and endings. Next morning I spoke according to my dream, and found to

ZUÑI CEREMONY.

THUNDER MOUNTAIN.

my surprise that the fogs about the whole subject had cleared; for it proved that nearly all Zuñi verbs are regular, my subsequent studies having revealed only four or five exceptions to this rule. Wonder of wonders—a language of regular verbs!

And now began my most interesting studies—in which, alas, my teacher could not help me—of the etymology of the language.

Advocates of the "Bow-wow" theory of the origin of language may find convincing facts among the Zuñis. Take, for instance, the root *a-ti*. It is primarily an exclamation of mortal fear. As *a'-ti*, it means blood. It is a termination expressing violence, as in *la-pa-a-ti*—to shake violently—from *la-pa*, the sound of a shaken blanket, and *ati*. Ta-pa-*at-i*—to rap or pound, as at a door, from *ta-pa*—to tap—and *a-ti*. *Tsi-a-a-ti*—to cut or tear flesh or soft substance—from *tsi-a*, in imitation of the sound of cutting flesh, and *a-ti*. *Teshl-a-ti*—to fear; from *teshl*—to breathe hard, and *a-ti*. *A'-tu*—dark blood—from *a-ti*, the exclamation, and *u-e*—painful,—since black blood is supposed to cause inflammation. *A'-tu*, again, is a violent expression for "get out"; and *tuh* becomes an exclamation of anger, equivalent to our word damn. In fact, the number of words in which elements and roots occur derived from this one exclamation, *a-ti*, are so numerous as to become tedious to others than specialists. I venture, however, on one or two additional examples of derivation through imitation. *Pi-wi-wi-k'e-a* is the sound of a string or thread drawn over a resisting body or through the damp fingers. From this the word *pi-le*—a string—is derived. *Tsu-nu-nu-k'e-a* is the sound of air escaping from the punctured paunch of a slain animal. From it the word *tsu-le* (paunch) is derived. These two words shortened and combined, *pi-tsu-li-a*, signify a round line, a circle—from string and the shape of a paunch, which is round. Thus almost throughout is this remarkable archaic language of the Zuñis built up, bearing in itself no small portion of the primitive history, especially of the intellectual development of the people by whom it is spoken.

During my illness, I was brought into very close contact with the people. I began to think, from the domestic harmony by which I was surrounded, that I had found the long-sought-for social Utopia. One day, however, the governor had a quarrel with his brother-in-law, and with a few sarcastic and telling epithets gathered up his sheep-skins and blankets, came into my room, slammed the door after him, and did not cross the threshold again for months. The weeping but faithful K'ia-wu followed, and thenceforth they took up quarters with me. More than a year elapsed before I had any more privacy while in Zuñi.

The governor was a rare and singular character. I never tire of speaking or writing

of him. He was long-suffering to a degree incredible, but silent, emotionless, and unswerving when he had determined. One of his traits was cleanliness. One sunny afternoon he was pottering about the eagle-cage, picking up some hard-wood sticks, and carrying them to the oven, behind which he was carefully piling them. K'ia-wu was on the roof sifting corn, and chatting with some neighboring women. Presently I heard a whine; looking round I saw a large, fine dog limping along, his knee, left eye, lips, mouth, and whole face covered with the yellow spines of a porcupine.

"Ha! a yellow beard comes, and is unhappy," I cried.

"A yellow mustache," echoed and queried the governor.

"Why did you tell him?" called K'ia-wu from the roof, for she had just espied the miserable creature.

But the emotionless governor paid attention to neither dog nor remarks. He had just loaded his arms full of the sticks. K'ia-wu, encouraged, warned him that it was his "own uncle's dog." The governor approached the oven with his load; suddenly choosing from it a suitable club, he edged toward the dog, dropped the others, and with two blows across the muzzle dispatched it. Then catching the still struggling brute by the hind-legs, he dragged it toward the river, remarking: "Yellow beards sometimes make little children crazy, and cause thoughts," with which he threw him over the bank, and bade him "go west to the spirit-land of dogs," where he assured him "it would be well to hunt other game than porcupines." Then, under the full shower of K'ia-wu's reproaches, he anxiously asked, "Is supper ready?"

If any of the numerous aggrieved complained to him, he listened gravely with an expression of sympathetic interest, until the plaint was spent, then replied: "I have heard; indeed!" And if this somewhat unsatisfactory reply provoked further remarks, he usually went about what he had to do, or with his characteristic summary manner sent the malcontent home, or left him to plead to an empty room.

K'ia-wu troubled herself much with her husband's actions. They usually slept along the opposite side of my little room Night after night, hour after hour, I have heard her, in the peculiar sing-song tone of her race and sex, lecture the silent governor. The darkness would grow deeper, the embers on the hearth fade to ashes, but the theme lost neither interest nor voice. It used sorely to provoke me; and in my own language, hopelessly striving to sleep, I would sometimes curse both the persistency of the Zuñi Caudle and the silence of the matrimonial stoic. The voice would change, but not cease. "Ho! the younger brother is thoughtful; tomorrow I will fix his bed better," it would say; and the governor, filling the exclamation with the most perfect understanding of the situation, would ejaculate, "Humph!" but no more. Undisturbed, the current would then flow on until later, by considerable distance of the stars, the tone would die away. A moment of dead silence, then a cough from the governor, followed by the bland inquiry:

"Is that all?"

"What more should I say, talkless?" the old woman would reply, in a most injured and ill-controlled tone.

"Well, then" (with a yawn), "let's go to sleep, old girl (*o' ka-si-ki*), for it is time, and the younger brother is restless." With which he would turn over, cough again, and lapse into silence, hopeless to the tongue-weary woman, as evinced by her long-continued, half-smothered sobs.

I had nearly given up seeing a pair of garters which had been promised me, when one day, all bustle and smiles, the "Little mother" came in bearing them.

They were beautiful and well made,—they endure even yet,—and with matronly pride she laid them before me. I paid her liberally, that the subject of Lai-iu-lut-sa should not be resumed. But it was broached to the governor. That night when we were alone, he came and lay down by my side where I was writing.

"Get a big piece of paper," said he, and knowing him, I obeyed.

"Now write." I seized a pencil.

"'Thou comest?' said he, in his own language.

I wrote it and pronounced it.

"Good," said he; then added:

"'Yes; how are you these many days?'

"'Happy!' 'Sit down,' 'Eat.' (Then a tray of bread will be placed before you, but you must be polite, and eat but little, and soon say:) 'Thanks.'

"'Eat enough. You must have come thinking of something. What have you to say?'

"'I don't know.'

"'Oh! yes, you do; tell me.'

"'I'm thinking of you' (in a whisper).

"'Indeed! You must be mistaken.'

"'No!'

"'Aha! do you love me?'

"'Ay, I love you.'

"'Truly?'

"'Yes!'

"'Possibly; we will see. What think you, father?'

"'As you think, my child' (the father will say)."

"What in the name of the moon does all this mean, brother?" I asked him when he had made me read the questions and answers over two or three times, and said I had pronounced them all right.

"It means what you will say to Lai-iu-lut-sa to-morrow night when you go to see her."

I was perplexed. I knew not what to say, as I feared offending the good old man.

"Look here, brother, I can't go to see her; she would laugh at me because I can't speak good Zuñi yet."

"Now that's all I have to say to you," he replied, angrily. "I've done my best for you; if fools will be fools, not even their brothers can help it. I see you propose to live single and have everybody say: 'There goes a man that no woman will have; not even when his brother helps him. No! Do you suppose I am blind? You are no Zuñi; you want to go back to Washington; but you can't, I tell you. You might as well get married; you *are* a Zuñi—do you hear me? You are a fool, too!"

With this, he left me; nor would he speak to me again for many days, save on the most commonplace affairs of life, and then but briefly.

My old father here came to my relief. He persuaded the vexed governor that perhaps Lai-iu-lut-sa did not suit me, and that my refusal of her was no argument against my love for her people. With a sublime sense of his power of diplomacy, he also sat down to have a talk with me the same evening. "You see, my son, I had nothing to say about Lai-iu-lut-sa; don't like her myself," said he, with a smile. "Now had it been Iu-i-tsaih-ti-e-tsa, I should have said, 'Be it well!'" and he waited for me to ask who she was. I kept a wise silence—my old brother kept a sulky one. "She is the finest being in our nation; and *my own niece*," he added, with emphasis.

"I never saw her," said I.

"Is that all?" he exclaimed, eagerly. "Well! she shall bring you a bundle of candle-wood to-morrow evening," he remarked.

"What shall I pay her for it?" I asked.

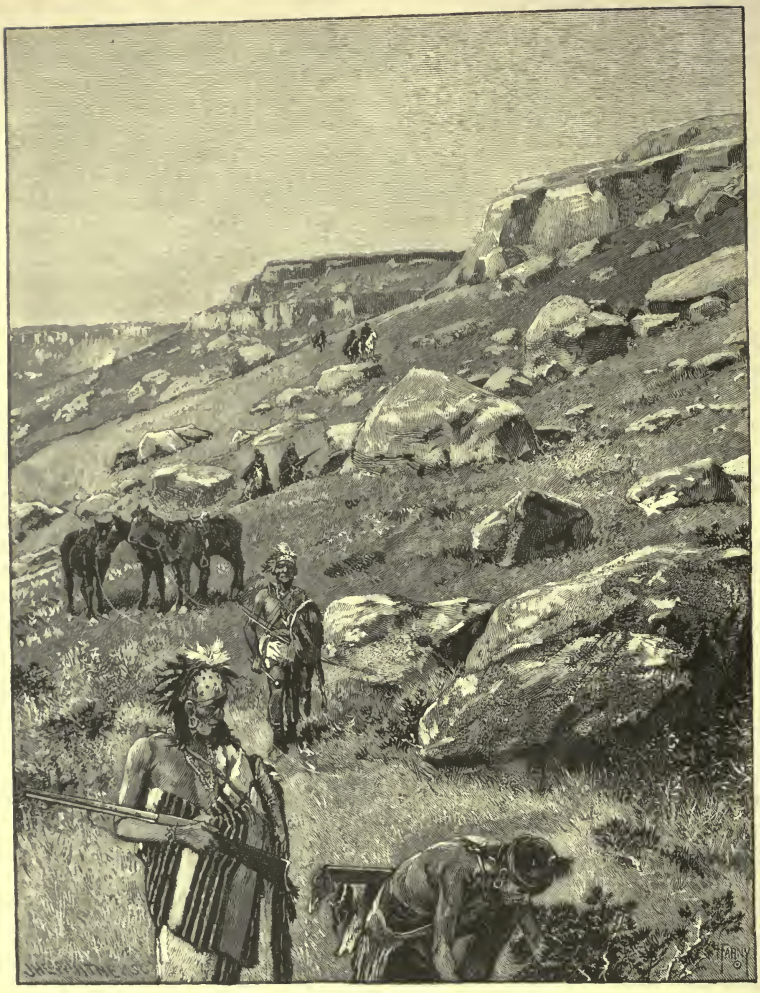
"Pay her! Nothing, my son; do you wish her to think you a fool, and cover me with shame?"

Next evening, I went to see Mr. Graham, the trader, and staid late. When I returned, a little bundle of pitch-pine was lying by the door-way, and the old governor, getting up with an oath, left the house. Again the girl brought wood, at a time unexpected to me, yet I happened to be absent; and the matter, with many vexatious remarks on my strange behavior, was for a time given up.

The Zuñi customs connected with courtship are curious. Regularly, a girl expresses a fancy for a young man. Her parents or her relatives inform those of the youth, and the latter is encouraged. If suited, he casually drops into the house of the girl, when much the same conversation as the governor tried to teach me ensues; and "if it be well," the girl becomes his affianced, or *Yi-lu-k'ia-ni-ha* (His to be). Thereafter the young couple may be seen frequently together—the girl combing his hair on the sunny terraces, or, in winter, near the hearth, while he sits and sews on articles of apparel for her. When he has "made his bundle," or gathered a sufficient number of presents together,—invariably including a pair of moccasins made from a whole deer-skin,—he takes it to her, and if they are accepted he is adopted as a son by her father, or, in Zuñi language, "as a ward," *Ta-la-h'i;* and with the beginning of his residence with her commences his married life. With the woman rests the security of the marriage ties; and it must be said, in her high honor, that she rarely abuses the privilege; that is, never sends her husband "to the home of his fathers," unless he richly deserves it. Much is said of the inferior position of women among Indians. With all advanced tribes, as with the Zuñis, the woman not only controls the situation, but her serfdom is customary, self-imposed, and willing absolutely. To her belong, also, all the children; and descent, including inheritance, is on her side.

I did not learn, until late in the season, that the midnight Ka-Kas were held thrice monthly during two of the winter months, in all the estufas, or *ki-wi-tsi-we*, of the pueblo, of which there were six, corresponding in Zuñi mythology to the six regions of the universe,—North, West, South, East, Upper, and Lower. One day, however, there came past my house two costumed and masked "Runners of the Ka-Ka." I followed them into a *ki-wi-tsin*. A group of priests near the smoky, rude, stone altar, were gathered, barefooted and praying. I drew my moccasins off, and joined them. A friend among them told me, as we left, that I had "behaved so wisely I could come with him that night and see the Ka-Kas."

What a wonderful night it was! The blazes of the splinter-lit fire on the stone altar, sometimes licking the very ladder-poles in their flight upward toward the sky-hole,—which served at once as door-way, chimney, and window; the painted tablets in one end, with priests and musicians grouped around; the spectators opposite and along the sides; the thin, upward streams of blue smoke from hundreds of cigarettes; the shrill calls of the rap-



A ZUÑI WAR-PARTY.

idly coming and departing dancers, their wild songs, and the din of the great drum, which fairly jarred the ancient, smoke-blackened rafters; the less distinguishable but terribly thrilling "swirr-r" of the yucca-whips, when brought down on some luckless sleeper's head and shoulders; the odors of the burning sacrifices, the tobacco, and of evergreen. All this was impressed indelibly on my memory,—the more impressive, that I was the first of my race to witness it. Wonderful, too, were the costumes and masks. Scaly monsters, bristling with weapons and terrible of voice and manner, with reptile heads; warrior demons, with grinning teeth, glaring eyes, long horns, mats of grizzly hair and beard; grotesque *Ne-wes;* ludicrous *Ko-yi-mashis;* ridiculous caricatures of all things in earth, and of men's strange conceptions. Such made up the sights of the *ki-wi-tsin* of the midnight Ka-Kas. Prayers near morning, distribution of the medicine-water to each of us, and, in Zuñi language, "like leaves in a sand-storm the people severed."

With February came the season of general abandonment to games, when old men and young children were busy with the chances of the thrown stick, the hidden ball, or the contest of matched strength. Even the non-participants, the women, were intensely excited with these peaceful contests; betting, in common with their at all other times less temperate husbands, the choicest articles of apparel, or the most valued items of possession.

One remarkable feature of the Zuñis had impressed me—the well-regulated life they lead. At one season they are absorbed in harvesting, at another in the sacred obligations; now games lead the day, while previously they have been

A ZUÑI FARM-HOUSE.

of such rare occurrence — even among little children — that I had written in my November notes, "The Zuñis have few if any games of chance"; while, had my observations been confined to February, I would have written "A nation of gamesters."

Like most things else in Zuñi, their games were of a sacred nature. Now that the nation "had straightened the thoughts of the impassably terrible 'A-hai-iu-ta' and Ma-tsai-le-ma, the 'beloved two' smiled and willed that, with the plays wherewith they themselves had whiled away the eons of times ancient, should their children be made happy with one another."

So one morning, the two chief priests of the bow (Pi-thlan-shi-wan-mo-so-na-tchi) climbed to the top of the houses, and just at sunrise called out a "prayer-message" from the mount-enshrined gods. Eight players went into a *ki-wi-tsin* to fast, and four days later issued forth, bearing four large wooden tubes, a ball of stone, and a bundle of thirty-six counting straws. With great ceremony, many prayers and incantations, the tubes were deposited on two mock mountains of sand, either side of the "grand plaza." A crowd began to gather. Larger and noisier it grew, until it became a surging clamorous black mass. Gradually two piles of fabrics, — vessels, silver ornaments, necklaces, embroideries, and symbols representing horses, cattle, and sheep, — grew to large proportions. Women gathered on the roofs around, wildly stretching forth articles for the betting; until one of the presiding priests called out a brief message. The crowd became silent. A booth was raised, under which two of the players retired; and when it was removed, the four tubes were standing on the mound of sand. A song and dance began. One by one, three of the four opposing players were summoned to guess under which tube the ball was hidden. At each guess the cries of the opposing parties became deafening, and their mock struggles approached the violence of mortal combat. The last guesser found the ball; and as he victoriously carried the latter and the tubes across to his own mound, his side scored ten. The process was repeated. The second guesser found the ball; his side scored fifteen, setting the others back five. The counts numbered one hundred; but so complicated were the winnings and losings on both sides, with each guess of either, that hour after hour the game went on and night closed in. Fires were built in the plaza, cigarettes lighted, but still the game continued. Noisier and noisier grew the dancers, more and more insulting and defiant their songs and epithets to the opposing crowd, until they fairly gnashed their teeth at one another, but no blows! Day dawned on the still uncertain contest; nor was it until the sun again touched the western horizon, that the hoarse, still defiant voices died away, and

the victorious party bore off their "mountains of gifts from the gods."

Another game of the gods was ordered later, in the same way—*Ti-kwa-we*, or the race of the "kicked stick."

Twelve runners were chosen and for four days duly "trained" in the estufas. On the fourth morning, the same noisy, surging crowd was gathered in the principal plaza, the same opposing mountains of goods were piled up. At noon, the crowd surged over to the level, sandy plain beyond the river. They were soon followed by the nude contestants, in two single-file processions, led and closed in by the training-masters. Each had his hair done up in a knot over his forehead, and a strong belt girded tightly about his waist. Either leader carried a small round stick, one painted at the center, the other at either end, with red. When all was ready, each leader placed his stick across his right foot, and, when word was given, kicked it, amid the deafening shouts of the spectators, a prodigious distance into the air and along the trail. Off dashed the runners vying with each other for possession of the stick, and followed by dozens of the wild crowd on foot and on horseback. The course of their race was shaped not unlike a bangle, with either end bent into the center. That is, starting from the river-bank, it went to the southern foot-hills, followed the edge of the valley entirely around, and back whence it had started, in all a distance of nearly twenty-five miles. During the progress of the distant circling race, spectators, including hundreds of the women, lined the house-tops. In much less than two hours and a half the victorious party returned, kicked their stick triumphantly across the river, ran into the plaza, circled around the goods, breathed on their hands, exclaimed, "Thanks! this day we win," and hurried to their estufa, where with great ceremony they were vomited, rubbed, rolled in blankets, and prayed over. Notwithstanding these precautions, they were so stiff within half an hour they could hardly move; yet no one can witness these tremendous races without admiration for the physical endurance of the Indian.

These two games, varied with others which, equally interesting, would require even more space for description, filled the days and nights thenceforward for many weeks. Although I faithfully studied and practiced many of the more complicated of them that I might the better understand them, I remain, notwithstanding many losings and few winnings, yet unable to perfectly master their intricacies. The game of cane-cards, or the "Sacred Arrows," would grace the most civilized society with a refined source of amusement; yet though I have played it repeatedly, I cannot half record its mythic passes, facetious and archaic proverbs, and almost numberless counts. The successful *shos-li*, or cane-player, is as much respected for his knowledge as he is despised for his abandoned, gambling propensities. Great though their passion for game be, the Zuñis condemn, as unsparingly as do we, great excesses in it.

ZUÑI PLANTING.

With the waning of winter the snows had disappeared, and now terrific winds swept daily down from the western "Sierra Blanco," until the plain was parched, and the stinging blasts of sand flew fairly over the top of Ta-ai-yal-lon-ne. Still the races and games went on, until one morning the Priest of the Sun declared aloud that the sun was returning. "Our father has called and his father answers," said the people to one another. The games ceased as if by magic; and the late profligate might now have been seen, early each morning, with hoe and spade in hand, wending his way out to the fields to prepare them for the planting time.

Each morning, too, just at dawn, the Sun Priest, followed by the Master Priest of the Bow, went along the eastern trail to the ruined city of Ma-tsa-ki, by the river-side, where, awaited at a distance by his companion, he slowly approached a square open tower and seated himself just inside upon a rude, ancient stone chair, and before a pillar sculptured with the face of the sun, the sacred hand, the morning star, and the new moon.

There he awaited with prayer and sacred song the rising of the sun. Not many such pilgrimages are made ere the "Suns look at each other," and the shadows of the solar monolith, the monument of Thunder Mountain, and the pillar of the gardens of Zuñi, "lie along the same trail." Then the priest blesses, thanks, and exhorts his father, while the warrior guardian responds as he cuts the last notch in his pine-wood calendar, and both hasten back to call from the house-tops the glad tidings of the return of spring. Nor may the Sun Priest err in his watch of Time's flight; for many are the houses in Zuñi with scores on their walls or ancient plates imbedded therein, while opposite, a convenient window or small port-hole lets in the light of the rising sun, which shines but two mornings in the three hundred and sixty-five on the same place. Wonderfully reliable and ingenious are these rude systems of orientation, by which the religion, the labors, and even the pastimes of the Zuñis are regulated.

Each day whole families hastened away to their planting pueblos, or distant farm-houses, but the sand-storms abated not. At night there was not a zephyr, but soon after sunrise, away off over the western rim of the plain, a golden, writhing wave of dust could be seen, followed by another and another, and rising higher and higher, until as it swirled over the pueblo it fairly darkened the sky, increasing in column and height until the sun went down; then retreating after him and covering the plain, not with golden, but with blood-red waves, matching in brilliancy and shifting beauty the blazing clouds of the evening skies.

I well remember the morning my old brother and I parted for the first time. He lingered by me long after the others had gone and his burros had strayed far up the valley trail. Finally, he took me gently by the hand, saying:

"Ah! little brother, my heart is like the clods I go to break—heavy! For I have grown to you as one stalk grows to another when they are planted together. Poor little brother, may the light of their favors fall upon you, for you will live long alone with the white-headed 'old Ten.' Come with me a little."

Then he dropped my hand, and folded his own behind his bent back, and I followed him slowly along the dusty street. As we were crossing the principal plaza, we met Iu-i-tsaih-ti-e-tsa. She drew her head-mantle over her eyes, and was about to pass us when the governor straightened up, smiled, and greeted her.

"Ha?" inquired the bashful maiden, when he told her something was on his mind.

"Only this," he added: "my little brother will be lonely while I am gone; perhaps he would be less so if you took him a tray of *he-we* once in a while, you know it is 'homesick' to eat alone."

"Ya," assented the girl, as she tripped past us, and we plodded along.

"Now, little brother, stay at home like a man of dignity, while I am gone. Don't you know it is shameless to run all round the streets and over the house-tops as you do? Better your thoughts, and make your heart good, and remember that your brother speaks for you *once more*."

Poor old brother! Good old brother! He never had occasion to mention Iu-i-tsaih-ti-e-tsa to me again, and for many months a shade passed over his face whenever he saw her or heard her name.

We went on past the gardens, and far out into the plain. Then he stopped me.

"Little brother," said he, and he laid one hand on my shoulder, while with the other he removed his head-band, and pressed both of mine, "*This day we have a father who, from his ancient place, rises hard holding his course; grasping us that we may stumble not in the trails of our lives. If it be well, may his grasp be firm until, happily, our paths join together again, and we look one upon the other.* Thus much I make prayer,—I go."

With this he turned suddenly, a tear in his eye, and walked hastily along the river-side. And I stood there watching him, until his bent form disappeared, and trying hard to bear the loneliest moment of all my exile in Zuñi. God bless my Indian brother!

I expected to have a hard time with my "white-headed mother," as I called her; but she was the soul of tenderness and attention. Only one circumstance occurred to jar our peace; that, happily, the second day. I was not in the house when the crash came; but entering soon after, I saw the cause of it, and heard from the mother. Something stood in the middle of my room, with a white mantle of cotton spread over it. I lifted the mantle, and discovered a handsome tray of flaky *he-we*. The mother was awaiting me—much as a spider waits for a fly—just inside the next room.

"Who brought it, mother?" said I, in mock surprise.

"*You* ask who brought it? Well! Who should it be but that shameless wench who lives over the covered way, whose mother has clog feet, and whose father is so poor that no one knows how they live? No matter if young fools do grow crazy over her; she's nothing, nothing at all, Medicine Flower, nothing but a common creature that is not human enough to know what shame is."

A ZUÑI SILVERSMITH.

"Indeed, was it Iu-i-tsaih-ti-e-tsa?"

"Then I knew it!" she rejoined. "You knew all about it. You are not going to let her make a fool of *you*, are you, Medicine Flower? (I was usually her *child*, but on this occasion I was *Medicine Flower*, emphatically pronounced.) She doesn't *near* to you at all; she only thinks of what you have and of your fine buttons."

"Where does she live, mother?"

"Why do you ask?"

"I wish to go and see her."

"I'll have nothing to do with it. Shame myself? Not I!"

"But I wish to *pay* her."

"Ha! my child? Right over the covered way, up two ladders, and down the first sky-hole," replied the old lady, suddenly as bland as though spite had never caused her heart to beat the faster during her long life.

"I'm going to have her come here."

"*No!* She shall not come into——"

"Wait, mother, wait. Have her come here to eat, and then refuse to eat with her, and pay her sugar; but mind, don't you tell my good old brother."

"Your brother? Aha! Then *he* was mixed up in it, was he? Poor child! I thought it was you. So it was Pa-lo-wah-ti-wa. Ah, well! he's a *Pino*, you know—the family is all alike; he belongs to a good clan, but his father's blood is *his* blood."

Peace was made with the mother, and I went to the house of Iu-i-tsaih-ti-e-tsa. She was not at home. I left word for her to come and eat with me at sunset. When she came, I was writing. She was accompanied by her aunt. I bade them enter, set coffee, bread, *he-we*, sugar, and other delicacies before them. Then I merely broke a crust, sacrificed some of it to the fire, ate a mouthful, and left them, resuming my writing. The girl dropped her half-eaten bread, threw her head-mantle over her face, and started for the door. I called to her and offered her a bag of sugar in payment, I said, for the *he-we*. At first she angrily refused; then bethinking herself that I was an American and possibly knew no better, she took the sugar and hastened away, mortified and almost ready to cry with vexation. Poor girl! I knew I was offering her a great dishonor,—as runs the custom of her people,—but it was my only way out of a difficulty far more serious than it could have possibly appeared to her people. The aunt was an old friend of mine. She had frequently come to our house to help grind corn, or make *he-we*, and thought much of me,—calling me, always, *ha-ni* (a sister's younger brother). She remained a few moments; then rising, thanked me, and was about to go when I said to her: "Sister, Iu-i-tsaih-ti-e-tsa is a good and pretty girl. I like her; but it will be many days before I

think of women save as sisters and mothers." The woman hesitated a moment, then said:

"Ha-ni, you are a good being, but an unknowable sort of a man. You have caused me to think much this night and made me ashamed, but then!—may you sit happily, even alone," she added, as she passed out of the door.

(However out of place these statements may seem, I deem them not only essential to the narrative, but characteristic of the Zuñis, and of their early attitude toward me. Possibly, too, they may disarm charges and criticisms which are as narrow, unrefined, and malicious, as they are false.)

The old mother entered immediately, and without further remark than a sigh of relief, cleared the things away.

During our lonely life together, I often helped her to split wood, or lift heavy burdens, wind yarn, or bring water. She never failed to thank me for the least of these services. Once she came in, looking tired; I arose and offered her my seat by the hearth. She hesitated a moment, laughed hysterically, then sat down; but in trying to thank me, burst into tears. "Ah!" said she, "*tsa-wai-k'i* (son), don't be so kind to me; I am old." But she never ceased to mention the little circumstance; and I know that of all services I ever did her, such as that ranked in her estimation foremost. It taught me that even "squaws" could sometimes appreciate such attentions.

ZUÑI COURTSHIP.

During my lonely life that spring, a few young men fell into the habit of visiting me occasionally, to "hear about the world." They would light their cigarettes, square themselves along the opposite wall, their faces beaming with expectation and satisfaction. An amusing chapter could be written on their questions and comments. I give here but one instance.

One of them asked me, "How the sun could travel so constantly over the world by day and back under it at night, without getting tired and giving it up?"

I explained that the earth revolved and the sun stood still, which caused day and night and made the sun appear to move, illustrating the statement as well as I could; also telling them, that "twice a year the earth wagged back and forth, which made winter come and go and the sun move from one side of Thunder Mountain to the other."

For a few moments they sat still and puffed vigorously at their cigarettes, as thoughtful men are apt to do. Of a sudden, one of them cried out:

"Listen! the Medicine Flower is right. If you gallop past Thunder Mountain, Thunder Mountain moves, and you stand still; and besides, I have noticed that in summer the great hanging snow-bank (Milky Way) drifts from the left of the Land of Daylight (N. E.) to the right of the World of Waters (S. W.); and in winter, from the left of the World of Waters (N. W.) to the right of the Land of Daylight (S. E.). Now! how could they move the great hanging snow-drift without moving the sky too? It would be easier to wag the world than to turn the sky around."

"Ah! but our ancients taught us——"

"No matter what our ancients taught us," said the young philosopher; "why do you speak the words of dead men? They lied, and Medicine Flower speaks straight, for why should the sun go so far and let the earth stand still, when, by merely rolling her over, he could save himself all that trouble?"

Meanwhile, three times word came from my old brother that he was "homesick for me." Finally he sent a horse, with the message that "if I did not ride it back the next day he should cease to speak to me, believing, that in forgetting him I had found another brother." But when I rode down the neatly tilled and irrigated fields, the old man, who was breaking clods, dropped his hoe, ran up to my side, pulled me from the saddle, embraced me, and that night sat up until nearly daylight, close by my side, in the low room of his quaint farm-house, talking. When time came for me to return, he gave up his work, and with K'ia-wu accompanied me, leaving the fields to the brother-in-law, with whom—K'ia-wu told me delightedly—"peace had been made."

It was well that we returned! The wind-storms were growing worse: day after day they had drifted the scorching sand over the valley, until the springs were choked up and the river was so dry that a stranger could not have distinguished it from a streamless arroyo. The nation was threatened with famine. Many were the grave speculations and councils relative to the "meaning of the gods in thus punishing their children."

Strange to say, I was given a prominent place in these, and was often appealed to, on account of my reputed "knowledge of the world." More and more frequent and desperate grew these gatherings, until at last a poor fellow named "Big Belly" was seized and brought up before them, accused of "heresy!" The trial—in which I had taken no part—lasted a whole day and part of night, when to my surprise a body of elders summoned me, and placed me at the head of their council. They addressed and treated me as chief counselor of their nation, which office I held thenceforward for nearly two years. Among other things, they asked what should be done. I inquired minutely into the case, and learned that the culprit had opened one of the sand-choked springs, which proved to be sacred. The gods were supposed to be angry with the nation on account of his transgression,—demanding the sacrifice of his life. As impassionately as possible, I pleaded that the wind-storms had set in long before he opened the spring, and suggested that he be made to fill it up again and to sacrifice bits of shells and turquois to it. The suggestion was adopted! The additional penalty of ostracism, however, was laid upon him; and to this day he lives in the farming pueblo of K'iap-kwai-na-kwin, or Ojo Caliente.

One evil followed another. Many deaths occurred, among them, that of a beautiful girl, who had been universally liked. Nor did the wind-storms abate. As a consequence, I heard one night a peculiar, long war-cry. It was joined by another and another, until the sound grew strangely weird and ominous. Then three or four men rushed past my door yelling: "A wizard! a wizard!" The tribe was soon in an uproar. The priests of the Bow had seized an old man named the "Bat," and in one of their secret chambers were trying him for sorcery. I was not present, of course, at the trial; but at three o'clock in the morning they dragged him forth to the hill on the north side of the pueblo. There they tied his hands behind him with a rawhide rope; and passing the end of the latter over a pole, supported by high crotched posts, they drew him up until his toes barely touched the ground and he was bent almost double.

Then the four chief-priests of the Bow approached and harangued him one by one, but provoked no reply save the most piteous moans. Day dawned; yet still he hung there. The speeches grew louder and more furious, until, fearing violence, I ran home, buckled on my pistol, and returned. I went straight to the old man's side.

"Go back," said the accusers.

"I will not go back; for I come with words."

"Speak them," said they.

"These," said I. "You may try the old man, but you must not kill him. The Americans will see you, or find it out, and tell their people, who will say: 'The Zuñis murdered one of their own grandfathers.' That will bring trouble on you all."

"What! murder a wizard?" they exclaimed. "Ho!" and for a few moments I grew hope-

less; for the chief-priest turned to the old man, and asked, with mock tenderness·

"Father, does it hurt?"

"Ai-o," moaned the old man, in a weak voice. "I die, I am dying."

"That's right," retorted the priest. "Pull him up a little higher, my son," said he, addressing an assistant. "He says it hurts, and I have hopes he will speak." Then he turned to me again.

"This is our way, my son, of bringing bad men to wisdom; I have worn my throat out urging him to speak; now I am trying another way. If he but speak, he shall be let to go."

"What shall I say?" piteously moaned the suffering man.

"Say *yes* or NO! dotard," howled the priest.

"Speak, grandfather, speak!" said I, as re-assuringly as I could, at the same time laying my hand on his withered arm.

"Tell them to let me down, then," he pleaded, "for I can speak not long as I am; I shall die. Oh! I shall die."

"Thanks! father, thanks!" said the priest, briskly. "Let him down; he is coming to his senses, I see."

They let the sufferer down for a moment; and gazing on the ground, he began:

"True! I have been bad. My father taught me fifty years ago, in the mountains of the summer snows. It was medicine that I used. You will find a bundle of it over the rafters, in my highest room."

One of the attendants was immediately dispatched, and soon returned with a little bunch of twigs.

"Ay! that it is, I used that. It has covered me with shame; but I will be better. I will rejoin my *ti-k'ia* (sacred order). It will surely rain within four days; for if you but let me go, I shall join my *ti-k'ia* again."

"Will you be wise?"

"Yes! believe me."

"Will you stay in Zuñi?"

"Yes! believe me."

"Will you never more cause tears?"

"No! It were a shame."

"Will you never teach to others your magic?"

"No! believe me——"

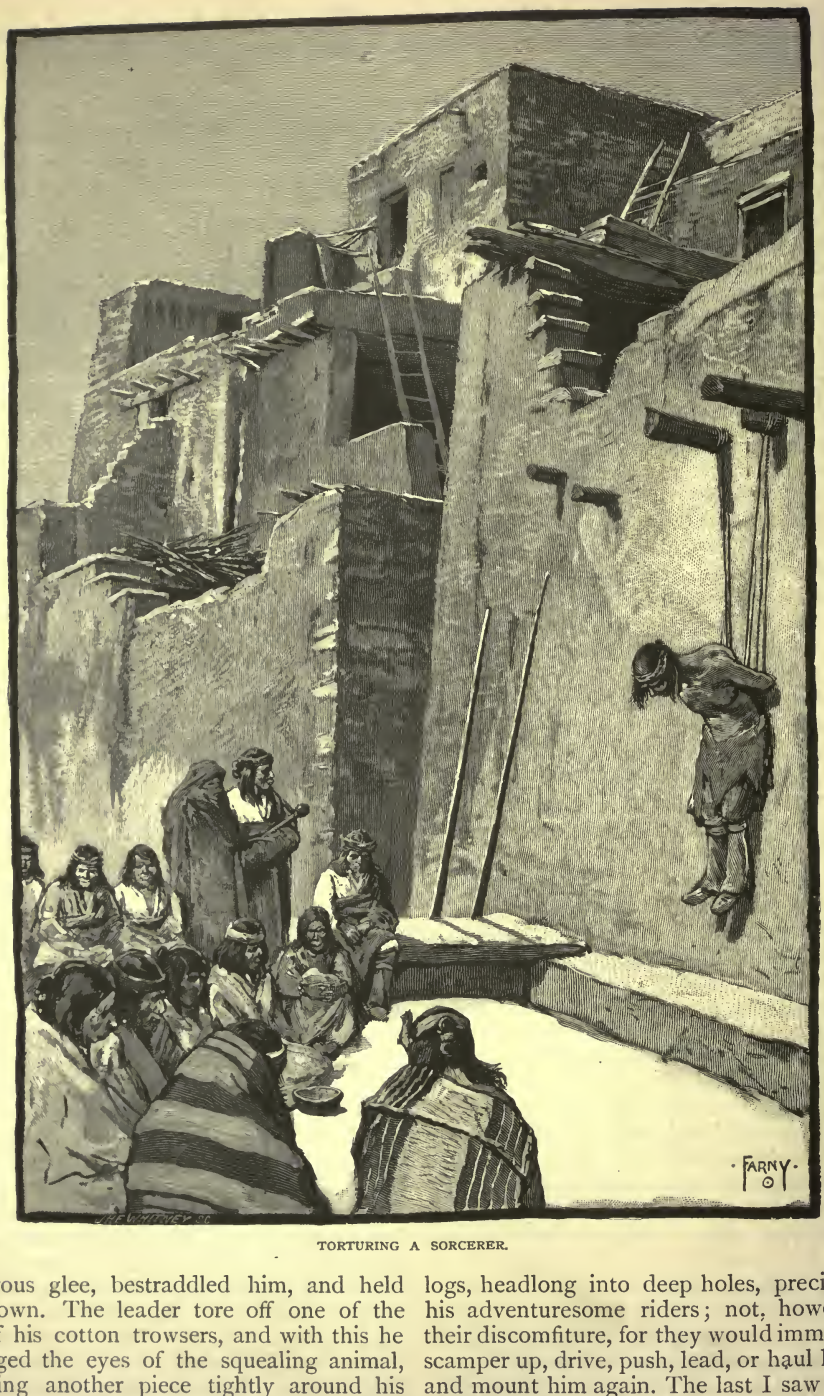
"Thanks! You have spoken. Let him go!" said the priest, as he walked hastily through the crowd toward his home.

Four days passed, and no rain came; nor did the "Bat" do as he had promised, for he returned home only to threaten revenge on the priesthood, and since the fifth day no one outside of that priesthood has ever seen a trace of the "Bat."

In Zuñi law-custom there are but two crimes punishable by death—sorcery and cowardice in battle. If, however, a man attempt the life of another, or even threaten it, he is regarded as a wizard; but no immediate measures are taken for his correction. Should crops fail, wind-storms prevail, or should the threatened man die, even from natural causes, the reputed wizard is, when he least expects it, dragged from his bed at night by the secret council of the A-pi-thlan-shi-wa-ni, taken to their chamber and tried long and fairly. Should the culprit persist in silence, he is taken forth and tortured by the simple yet excruciatingly painful method I have described, throughout a "single course of the sun"; and if still silent, again taken to the chamber of the priesthood, whence he never comes forth alive; nor do others than members of the dread organization ever know what becomes of him. Rare indeed is the execution for which no other than superstitious reasons may be adduced. Even in case of the "Bat," I learned that he had attempted to poison his own niece, the girl heretofore mentioned, the death of whom, a few weeks afterward, rendered him a criminal and liable to condemnation, not only as such, but as a sorcerer. Thus, like a vigilance committee, the priesthood of the Bow secretly tries all cases of capital crime under the name of sorcery or witchcraft,—the war-chief of the nation, himself necessarily a prominent priest of the Bow, acting as executioner, and, with the aid of his sub-chiefs, as secretly disposing of the body. On account of this mysterious method of justice crime is rare in Zuñi.

At last, in late June, rains came. As if by magic, the dust-storms ceased, and the plains were overspread with bright green. The Zuñis became uproariously happy. The members of the little "bees," that were formed for mutual assistance in the field labors, laughed and joked at their work from sunrise till supper-time. The river flowed broad and clear again. Thither again flocked the urchin population as I had seen them the autumn before.

One day I saw some of the children playing at "breaking horses." One juvenile demon was leading a band of four or five others, in the pursuit of a big bristling boar. Lasso in hand, the little fellow watched his chance, and, twirling the flexible cord once or twice rapidly in the air, sent it like lightning toward the head of the boar. The latter made a desperate dash only to run his snout and forefoot into the coil, which, held by the combined efforts of all, quickly precipitated him, in a succession of entangling somersaults, into the shallow river. In an instant another lasso was dexterously thrown over his hind feet, and his captors, heedless of mud and water, wild with

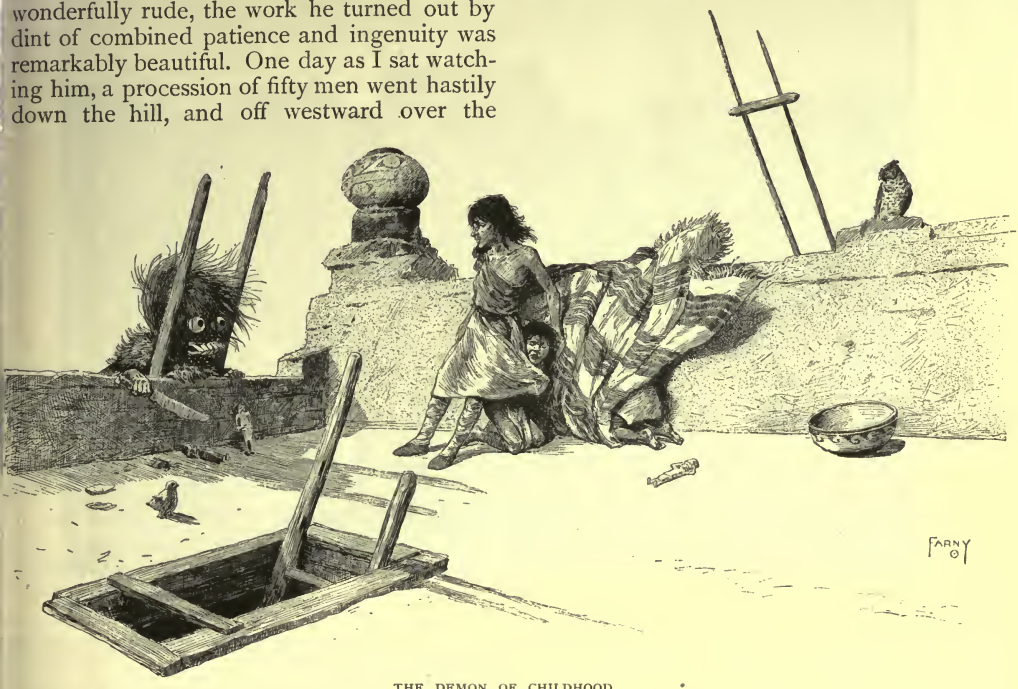


TORTURING A SORCERER.

vociferous glee, bestraddled him, and held him down. The leader tore off one of the legs of his cotton trowsers, and with this he bandaged the eyes of the squealing animal, wrapping another piece tightly around his snout so as to smother his cries. Thus equipped, the hog was set at liberty. Two of the little wretches jumped astride him, while the others prodded him behind and at the sides. Thus goaded, the poor beast ran uncertainly in all directions, into corrals, over logs, headlong into deep holes, precipitating his adventuresome riders; not, however, to their discomfiture, for they would immediately scamper up, drive, push, lead, or haul him out, and mount him again. The last I saw of them was toward evening; they were ruefully regarding the dead carcass of their novel horse.

With midsummer the heat became intense. My brother and I sat, day after day, in the cool under-rooms of our house,—the latter busy with his quaint forge and crude appli-

ances, working Mexican coins over into bangles, girdles, ear-rings, buttons, and what not, for savage adornment. Though his tools were wonderfully rude, the work he turned out by dint of combined patience and ingenuity was remarkably beautiful. One day as I sat watching him, a procession of fifty men went hastily down the hill, and off westward over the plain. They were solemnly led by a painted and shell-bedecked priest, and followed by the torch-bearing Shu-lu-wit-si, or God of Fire. After they had vanished, I asked old brother what it all meant.



THE DEMON OF CHILDHOOD.

"They are going," said he, "to the city of the Ka-ka and the home of our others."

Four days after, toward sunset, costumed and masked in the beautiful paraphernalia of the Ka-k'ok-shi, or "Good Dance," they returned in file up the same pathway, each bearing in his arms a basket filled with living, squirming turtles, which he regarded and carried as tenderly as a mother would her infant. Some of the wretched reptiles were carefully wrapped in soft blankets, their heads and forefeet protruding,—and, mounted on the backs of the plume-bedecked pilgrims, made ludicrous but solemn caricatures of little children in the same position.

While I was at supper upstairs, that evening, the governor's brother-in-law came in. He was welcomed by the family as if a messenger from heaven. He bore in his tremulous fingers one of the much-abused and rebellious turtles. Paint still adhered to his hands and bare feet, which led me to infer that he had formed one of the sacred embassy.

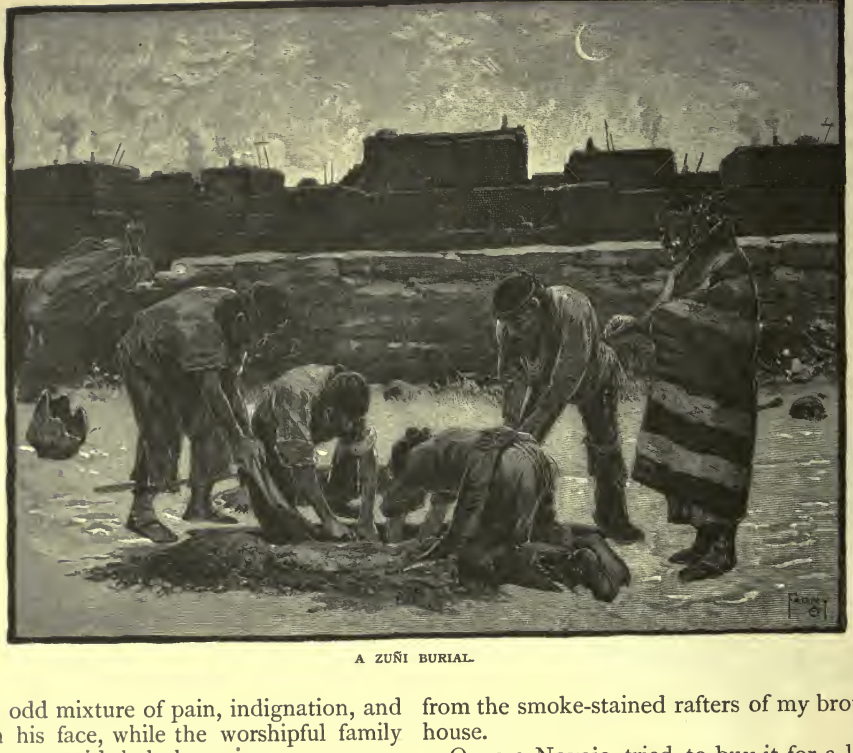
"So you went to Ka-thlu-el-lon, did you?" I asked.

"E'e," replied the weary man, in a voice husky with long chanting, as he sank, almost exhausted, on a roll of skins which had been placed for him, and tenderly laid the turtle on the floor. No sooner did the creature find itself at liberty than it made off as fast as its lame legs would take it. Of one accord, the family forsook dish, spoon, and drinking-cup, and grabbing from a sacred meal-bowl whole handfuls of the contents, hurriedly followed the turtle about the room, into dark corners, around water-jars, behind the grinding-troughs, and out into the middle of the floor again, praying and scattering meal on its back as they went. At last, strange to say, it approached the foot-sore man who had brought it.

"Ha!" he exclaimed, with emotion; "see, it comes to me again; ah, what great favors the fathers of all grant me this day," and passing his hand gently over the sprawling animal, he inhaled from his palm deeply and long, at the same time invoking the favor of the gods. Then he leaned his chin upon his hand, and with large, wistful eyes regarded his ugly captive as it sprawled about blinking its meal-bedimmed eyes, and clawing the smooth floor in memory of its native element. At this juncture, I ventured a question:

"Why do you not let him go, or give him some water?"

Slowly the man turned his eyes toward



A ZUÑI BURIAL.

me, an odd mixture of pain, indignation, and pity on his face, while the worshipful family stared at me with holy horror.

"Poor younger brother!" he said, at last; "know you not how precious it is? It die? It will *not* die; I tell you, it *cannot* die."

"But it will die if you don't feed it and give it water."

"I tell you it *cannot* die; it will only change houses to-morrow, and go back to the home of its brothers. Ah, well! How should *you* know?" he mused. Turning to the blinded turtle again: "Ah! my poor dear lost child or parent, my sister or brother to have been! Who knows which? May be my own great-grand-father or mother!" And with this he fell to weeping most pathetically, and, tremulous with sobs, which were echoed by the women and children, he buried his face in his hands. Filled with sympathy for his grief, however mistaken, I raised the turtle to my lips and kissed its cold shell; then depositing it on the floor, hastily left the grief-stricken family to their sorrows.

Next day, with prayers and tender beseechings, plumes and offerings, the poor turtle was killed, and its flesh and bones were removed and deposited in the little river, that it might "return once more to eternal life among its comrades in the dark waters of the lake of the dead." The shell, carefully scraped and dried, was made into a dance-rattle, and, covered by a piece of buckskin, it still hangs from the smoke-stained rafters of my brother's house.

Once a Navajo tried to buy it for a ladle; loaded with indignant reproaches, he was turned out of the house. Were any one to venture the suggestion that the turtle no longer lived, his remark would cause a flood of tears, and he would be reminded that it had only "changed houses and had gone to live forever in the home of 'our lost others.'"

This persistent adherence to the phrase, "our lost others," struck me as significant. Had they believed in the transmigration of the soul, they would have said "our brothers, our fathers, our children," I reasoned; and yet it was long before I learned the true meaning of it. At last, a wonderful epic, including the genesis and sacred history of the Zuñi ancestry, was repeated in my hearing by an old blind priest, through which I came to understand the regard my adopted people had for the turtle. I give a portion of the tradition as afterward explained to me:

"In the days of the new, after the times when all mankind had come forth from one to the other of the 'four great cavern wombs of earth' (*a-wi-ten te-huthl-na-kwin*), and had come out into the light of our father, the sun, they journeyed, under the guidance of A-hai-iu-ta and Ma-tsai-le-ma, twin children of the sun, immortal youths, toward the father of all men and things, eastward.

"In those times, a day meant four years, and a night the same; so that, in the speech of the ancients 'Between one sunrise and another' means eight years.

"After many days and nights, the people settled

near the mountain of the Medicine Flower, and a great cazique sent forward his two children, a young man and a young girl, — the passing beautiful of all children, — to explore for a better country. When they had journeyed as far as the region where now flow the red waters [Colorado Chiquito], they paused to rest from their journey. Ah! they sinned and were changed to a demon god and goddess.

"The world was damp. Plant corn on the mountain-tops, and it grew. Dig a hole into the sands at will, and water filled it.

"The woman in her anger drew her foot through the sands, that she might — from shame — separate herself from her people; and the waters, collecting, flowed off until they were a deep channel; yet they settled most about the place where she stood, and it became a lake which is there to this day. And the mark in the sands is the valley where now flow the red waters.

"No tidings came from the young messengers; and after many days the nation again journeyed eastward, carrying upon their backs not only their things precious, but also their little children. When they reached the waters they were dismayed; but some ventured in to cross over. Fear filled the hearts of many mothers, for their children grew cold and strange, like others than human creatures, and they dropped them into the waters, changed indeed; they floated away, crying and moaning, as ever now they cry and moan when the night comes on and the hunter camps near their shores. But those who loved their children and were strong of heart passed safely over the flood and found them the same as before.

"*Thus* it came to be that only part of our nation ever arrived at the 'middle of the world.' But it is well, as all things are; for others were left to remember us and to make a home, not of strangers, but of 'our others,' for those who should die and to intercede with the 'Holders of the Waters of the World' that all mankind and unfinished creatures, even flying and creeping beings, might have food to eat and water to drink when the world should harden and the land should dry up. And in that lake is a descending ladder, down which even the smallest may enter fearlessly, who has passed its borders in death; where it is delightful, and filled with songs and dances; where all men are brothers, and whence they wander whither they will, to minister to and guide those whom they have left behind them — that is the lake where live 'our others' and whither go our dead. At night, he who wanders on the hills of the Ka-ko'k-shi may sometimes see the light shining forth and hear strange voices of music coming up from the depths of those waters."

For the Zuñi, therefore, there is a city of the living and another of the dead. As the living may wander through far countries, so may the dead return to their birthland, or pass over from one ocean to another.

Possibly, at some remote period, the ancestors of the Zuñis have believed in the transmigration of the soul, of which belief these particular superstitions relative to the turtle remain as survivals. Their belief to-day, however, relative to the future life is spiritualistic. As illustrative of this and of their funeral customs, I conclude with an account of the death and burial, toward the close of my first year among them, of my adopted uncle.

For more than a year he had been wasting with consumption; when, on account of a medical reputation which had greatly aided me and had, indeed, given rise to my name, I was called to see him. I gave him such simple remedies as I had at hand, and he became very fond of me, at last adopting me as his nephew, and naming me Hai-iu-tsaih-ti-wa.

Toward the last, the old man talked often of his approaching death, speaking of the future life with an amount of conviction which surprised me.

"To dwell with my relatives, even those whose names were wasted before my birth, is that painful to the thought?" said the old man. "Often, when we dream not, yet we see and hear them as in dreams." "A man is like a grain of corn — bury him, and he molds; yet his heart lives, and springs out on the breath of life [the soul] to make him as he was, so again."

He grew rapidly feebler. For two or three days I did not see him. Hearing that he was worse, I hastened to his side. He was unconscious, and a crowd of relatives were thickly gathered around him, wringing their hands and wailing. Presently he opened his eyes.

"Hush," said he, and he raised his hand weakly with a smile of recognition, not of me, but of something he seemed to see. Then he turned to me. "My boy, I *thought* you would come," he murmured. "Now I can bid you, 'I go'; for they are — all around me — and I know — they have come for me — *this* time. My heart makes happy. *No*," said he, as a medicine-man tried to force breath into his mouth. "No, I go not alone! Let me go! *E-lu-ia* (Delightful!)"

Then he closed his eyes and became unconscious again, smiling even in his dying sleep.

Two hours after, the women of the same clan which had sprinkled water and meal on him when a baby, adopting him as "their child of the sun," bathed his body and broke a vessel of water by its side, thus renouncing all claim to him forever and returning his being to the sun. Then four men took the blanket-roll by the corners and carried it, amid the mourning wails of the women, to the ancient burial-place. They hastily lowered it into a shallow grave, while one standing to the east said a prayer, scattered meal, food, and other offerings upon it; then they as hastily covered it over, clearing away all traces of the new-made grave. *Now* I know not the bone-strewn grave of "my uncle" from those of a thousand others, for the "silent majority" of the Zuñi nation lie in the same small square. Four days later, down by the river, a little group of mourners sacrificed, with beseeching in the name of the dead, the only flowers their poor land affords — the beautiful prayer-plumes of the "birds of summerland."

Frank H. Cushing.

George du Maurier

DU MAURIER AND LONDON SOCIETY.

MANY years ago, a small American child, who lived in New York and played in Union Square, which was then inclosed by a high railing and governed by a solitary policeman — a strange, superannuated, dilapidated functionary, carrying a little cane and wearing, with a very copious and very dirty shirt-front, the costume of a man of the world — a small American child, we say, was a silent devotee of "Punch." (We ought, perhaps, to explain that we allude to the periodical of that name — not to the festive potion.) Half-an-hour spent to-day in turning over the early numbers transports him quite as much to old New York as to the London of the first Crystal Palace and the years that immediately followed it. From about 1850 to 1855, he lived, in imagination, no small part of his time in the world represented by the pencil of Leech. He pored over the pictures of the people riding in the Row, of the cabmen and the costermongers, of the little pages in buttons, of the bathing-machines at the sea-side, of the small boys in tall hats and Eton jackets, of the gentlemen hunting the fox, of the pretty girls in striped petticoats and coiffures of the shape of the mushroom. These things were the features of a world which he longed so to behold that the familiar wood-cuts (they were not so good in those days as they have become since) grew at last as real to him as the furniture of his home; and when he at present looks at the "Punch" of thirty years ago, he finds in it an odd association of mediæval New York. He remembers that it was in such a locality, in that city, that he first saw such a picture; he recalls the fading light of the winter dusk, with the red fire and the red curtains in the background, in which more than once he was bidden to put down the last numbers of the humorous sheet and come to his tea. "Punch" was England; "Punch" was London; and England and London were at that time words of multifarious suggestion to this small American child. He liked much more to think of the British Empire than to indulge in the sports natural to his tender age, and many of his hours were spent in making mental pictures of the society of which the recurrent wood-cuts offered him specimens and revelations. He had from year to year the prospect of really beholding this society (he heard every spring, from the earliest period, that his parents would go to Europe, and then he heard that they would not), and he had measured the value of the prospect with a keenness possibly premature. He knew the names of the London streets, of the theaters, of many of the shops: the dream of his young life was to take a walk in Kensington Gardens and go to Drury Lane to see a pantomime. There was a great deal in the old "Punch" about the pantomimes, and harlequins and columbines peopled the secret visions of this perverted young New Yorker. It was a mystic satisfaction to him that he had lived in Piccadilly when he was a baby; he remembered neither the period nor the place, but the name of the latter had a strange delight for him. It had been promised him that he should behold once more that romantic thoroughfare, and he did so by the time he was twelve years old. Then he found that if "Punch" had been London (as he lay on the hearth-rug inhaling the exotic fragrance of the freshly arrived journal), London was "Punch," and something more. He remembers to-day vividly his impression of the London streets in the summer of 1855; they had an extraordinary look of familiarity, and every figure, every object he encountered, appeared to have been drawn by Leech. He has learned to know these things better since then; but his childish impression is subject to extraordinary revivals. The expansive back of an old lady getting into an omnibus, the attitude of a little girl bending from her pony in the park, the demureness of a maid-servant opening a street-door in Brompton, the top-heavy attitude of the small "Ameliar-Ann," as she stands planted with the baby in her arms on the corner of a Westminster slum, the coal-heavers, the cabmen, the publicans, the butcher-boys, the flunkeys, the guardsmen, the policemen (in spite of their change of uniform),—are liable at this hour, in certain moods, to look more like sketchy tail-pieces than natural things. (There are moments indeed — not identical with those we speak of — in which certain figures, certain episodes, in the London streets, strike an even stranger, deeper note of reminiscence. They remind the American traveler of Hogarth; he may take a walk in Oxford street — on some dirty, winter afternoon — and find everything he sees Hogarthian.)

We know not whether the form of infantine nostalgia of which we speak is common, or was then common, among small Americans:

but we are sure that, when fortune happens to favor it, it is a very delightful pain. In those days, in America, the manufacture of children's picture-books was an undeveloped industry; the best things came from London, and brought with them the aroma of a richer civilization. The covers were so beautiful and shining, the paper and print so fine, the colored illustrations so magnificent,—that it was easy to see that over there the arts were at a very high point. The very name of the publisher on the title-page (the small boy we speak of always looked at that) had a thrilling and mystifying effect. But, above all, the contents were so romantic and delectable! There were things in the English story-books that one read as a child, just as there were things in "Punch," that one couldn't have seen in New York, even if one had been fifty years old. The age had nothing to do with it: one had a conviction that they were not there to be seen. We can hardly say why. It is, perhaps, because the plates in the picture-books were almost always colored; but it was evident that there was a great deal more color in that other world. We remember well the dazzling tone of a little Christmas book by Leech, which was quite in the spirit of "Punch," only more splendid, for the plates were plastered with blue and pink. It was called "Young Troublesome; or, Master Jacky's Holidays," and it has probably become scarce to-day. It related the mischievous pranks of an Eton school-boy while at home for his Christmas vacation, and the exploit we chiefly remember was his blacking with a burnt stick the immaculate calves of the footman, who is carrying up some savory dish to the banquet from which (in consequence of his age and his habits) Master Jacky is excluded. Master Jacky was so handsome, so brilliant, so heroic, so regardless of dangers and penalties, so fertile in resources; and those charming young ladies, his sisters, his cousins,—the innocent victims of his high spirits,—had such golden ringlets, such rosy cheeks, such pretty shoulders, such delicate blue sashes over such fresh muslin gowns! Master Jacky seemed to lead a life all illumined with rosy Christmas fire. A little later came Richard Doyle's delightful volume giving the history of "Brown, Jones, and Robinson," and it would be difficult to exaggerate the action of these remarkable designs in forming the taste of our fantastic little amateur. They told him, indeed, much less about England than about the cities of the continent; but that was not a drawback, for he could take in the continent, too. Moreover, he felt that these three travelers were intensely British; they looked at everything from the London point of view, and it gave him an immense feeling of initiation to be able to share their susceptibilities. Was there not also a delightful little picture at the end, which represented them as restored to British ground, each holding up a tankard of foaming ale, with the boots behind them, rolling their battered portmanteaux into the inn? This seemed somehow to commemorate one's own possible arrival in Old England, even though it was not likely that overflowing beer would be a feature of so modest an event; just as all the rest of it was a foretaste of Switzerland, of the Rhine, of North Italy, which after this would find one quite prepared. We are sorry to say that when, many years later, we ascended, for the first time, to the roof of Milan Cathedral, what we first thought of was not the "waveless plain of Lombardy," nor the beauty of the edifice, but the "little London snob," whom Brown, Jones, and Robinson saw writing his name on one of the pinnacles of the church. We had our preferences in this genial trio. We adored little Jones, the artist—if memory doesn't betray us (we haven't seen the book for twenty years)—and Jones *was* the artist. It is difficult to say why we adored him, but it was certainly the dream of our life at that foolish period to make his acquaintance. We did so, in fact, not very long after. We were taken in due course to Europe, and we met him on a steam-boat on the Lake of Geneva. There was no introduction; we had no conversation; but he was the Jones of our imagination. Thackeray's Christmas books ("The Rose and the Ring," apart—it dates from 1854,) came before this; we remember them in our earliest years. They, too, were of the family of "Punch"—which is my excuse for this superfluity of preface—and they were a revelation of English manners. "English manners," for a child, could of course only mean certain individual English figures—the figures in "Our Street," in "Doctor Birch and his Young Friends" (we were glad we were not of the number), in "Mrs. Perkins's Ball." In the first of these charming little volumes there is a pictorial exposition of the reason why the nurse-maids in "Our Street" like Kensington Gardens. When, in the course of time, we were taken to walk in those lovely shades, we looked about us for a simpering young woman and an insinuating soldier on a bench, with a bawling baby sprawling on the path hard-by, and we think we discovered the group.

Many people in the United States, and doubtless in other countries, have gathered their knowledge of English life almost entirely from "Punch," and it would be difficult

to imagine a more abundant, and on the whole a more accurate, informant. The accumulated volumes of this periodical contain evidence on a multitude of points of which there is no mention in the serious works—not even in the novels—of the day. The smallest details of social habit are depicted there, and the oddities of a race of people in whom oddity is strangely compatible with the dominion of convention. That the ironical view of these things is given does not injure the force of the testimony, for the irony of "Punch," strangely enough, has always been discreet, even delicate. It is a singular fact, that though *taste* is not supposed to be the strong point of the English mind, this eminently representative journal has rarely been guilty of violations of taste. The taste of "Punch," like its good humor, has known very few lapses. "The London Charivari"—we remember how difficult it was (in 1853) to arrive at the right pronunciation—has, in this respect, very little to envy its Parisian original. English humor is coarse, French humor is fine—that would be the general assumption, certainly, on the part of a French critic. But a comparison between the back volumes of the "Charivari" and the back volumes of "Punch" would make it necessary to modify this formula. English humor is simple, innocent, plain, a trifle insipid, apt to sacrifice to the graces, to the proprieties; but if "Punch" is our witness, English humor is not coarse. We are fortunately not obliged to declare just now what French humor appears to be—in the light of the "Charivari," the "Journal Amusant," the "Journal Pour Rire." A Frenchman may say, in perfect good faith, that (to his sense) English drollery has doubtless every merit but that of being droll. French drollery, he may say, is salient, saltatory; whereas the English comic effort is flat and motionless. The French, in these matters, like a great deal of salt; whereas the English, who spice their food very highly, and have a cluster of sharp condiments on the table, like their caricatures comparatively mild. "Punch," in short, is for the family—"Punch" may be sent up to the nursery. This surely may be admitted; and it is the fact that "Punch" is for the family that constitutes its high value. The family is, after all, the people; and a satirical sheet which holds up the mirror to this institution can hardly fail to be instructive. "Yes, if it hold the mirror up impartially," we can imagine the foreign critic to rejoin; "but in these matters the British caricaturist is not to be trusted. He slurs over a great deal—he omits a great deal more. He must, above all things, be proper; and there is a whole side of life which, in spite of his Juvenalian pretensions, he never touches at all." We must allow the foreign critic his supposed retort, without taking space to answer back,—we may imagine him to be a bit of a "naturalist,"—and admit that it is perhaps because they are obliged to be proper that Leech and du Maurier give us, on the whole, such a cleanly, healthy, friendly picture of English manners. Such sustained and inveterate propriety is in itself a great force; it includes a good deal, as well as excludes. The general impression that we derive from the long series of "Punch" is a very cheerful and favorable one; it speaks of a vigorous, good-humored, much-civilized people. The good humor is, perhaps, the most striking point—not only the good humor of the artist who represents the scene, but that of the figures engaged in it. The difference is remarkable in this respect between "Punch" and the French comic papers. The wonderful Cham, who for so many years contributed to those sheets, had an extraordinary sense of the ludicrous and a boundless stock of facetious invention. He was strangely expressive; he could place a figure before you, in the most violent action, with half-a-dozen strokes of his pencil. But his people were like wild-cats and scorpions. The temper of the French *bourgeoisie*, as represented by Cham, is a thing to make one take to one's heels. They perpetually tear and rend each other, show their teeth and their claws, kick each other down-stairs, and pitch each other from windows. All this is in the highest degree farcical or grotesque; but at bottom it is almost horrible. (It must be admitted that Cham and his wonderful colleague, Daumier, are much more horrible than Gavarni, who was admirably real, and at the same time capable of beauty and grace. Gavarni's women are charming; those of Cham and Daumier are monsters.) There is nothing, or almost nothing, of the horrible in "Punch." The author of these remarks has a friend whom he has heard more than once maintain the too-ingenious thesis that the caricatures of Cham prove the French to be a cruel people; the same induction could, at least, never be drawn, even in an equal spirit of paradox, from the genial pages of "Punch." "If 'Punch' is never horrible, it is because 'Punch' is always superficial, for life is full of the horrible"—so we may imagine our naturalistic objector to go on. However this may be, "Punch" is fortunate in having picked out such a charming surface. English life, as depicted by Leech and du Maurier, and by that excellent Charles Keene,—the best-humored perhaps of the three, whose talent is so great that we have always wondered why it is

not greater,—is a compound of several very wholesome tastes—the love of the country, the love of sport, the love of a harmless joke within the limits of due reverence, the love of sport, of horses and dogs, of family life, of children, of horticulture. With this there are a few other tastes of a less innocent kind,—the love of ardent spirits, for instance, or of punching people's heads,—or even the love of a lord. In Leech's drawings, country-life plays a great part; his landscapes, in their extreme sketchiness, are often admirable. He gave, in a few strokes, the look of the hunting-field in winter—the dark, damp slopes; the black, dense hedges; the low, cool sky. He was very general; he touched on everything, sooner or later; but he enjoyed his sporting subjects more than anything else. In this he was thoroughly English. No close observer of that people can fail to perceive that the love of sport is the thing that binds them most closely together, and in which they have the greatest number of feelings in common. Leech depicted, with infinite vividness, the accidents of the chase and of the fishing season; and his treatment of the horse, in especial, contributed greatly to his popularity. He understood the horse, he knew him intimately, he loved him; and he drew him as if he knew how to ride as well as to draw. The English forgive a great deal to those who ride well; and this is doubtless why the badness of some of the sporting subjects that have appeared in "Punch" since Leech's death has been tolerated; the artist has been presumed to be a good rider! Leech never made a mistake; he did well whatever he did; and, it must be remembered, that for many years he furnished the political cartoon to "Punch," as well as the smaller drawings. He was always amusing, always full of sense and point, always intensely English. His foreigner is always an inferior animal—his Frenchman is the Frenchman of Leicester Square, the Frenchman whom the Exhibition of 1851 revealed to the people of London. His point is perfectly perceptible—it is never unduly fine. His children are models of ruddy, chubby, shy, yet sturdy British babyhood; and nothing could be nicer than his young women. The English maiden, in Leech, is emphatically a nice girl; modest and fresh, simple and blooming, and destined evidently for use as much as for ornament. In those early days to which we referred at the beginning of this article, we were deeply in love with the young ladies of Leech, and we have never ceased to admire the simple art with which he made these hastily designed creatures conform unerringly to the English type. They have English eyes and English cheeks, English figures. English hands and feet, English ringlets, English petticoats. Leech was extremely observant, but he had not a strong imagination; he had a sufficient, but not a high sense of beauty; his ideal of the beautiful had nothing of the unattainable; it was simply a *résumé* of the nice faces he saw about him. And very nice they must generally have been. The great thing, however, was that he was a natural draughtsman; his little figures live and move; many of his little scenes are stamped on the memory. I have spoken of his representations of the country; but his town-pictures are numerous and capital. He knew his London, and his sketches of the good people of that metropolis are as happy as his episodes in the drawing-room and the hunting-field. He was admirably broad and free; and no one in his line has had more than he the knack of giving what is called a general effect. He conveys, at times, the look of the London streets—the color, the temperature, the damp blackness. He does the winter weather to perfection. Long before I had seen it, I was acquainted, through his sketches, with the aspect of Baker street in December. Out of such a multitude of illustrations it is difficult to choose: the two volumes of "Sketches of Life and Character," transferred from "Punch," are a real museum. But I recall, for instance, the simple little sketch of the worthy man up to his neck in bed on a January morning, to whom, on the other side of the door, the prompt housemaid, with her hammer in her hand, announces that "I have just broken the ice in your bath, sir." The black, cold dawn, the very smell of the early chill, that raw sootiness of the London winter air, the red nose of the housemaid, the unfashionable street seen through the window—impart a peculiar vividness to this small, inky-looking wood-cut.

We have said too much about Leech, however, and the purpose of these remarks is not to commemorate his work. "Punch," for the last fifteen years, has been, artistically speaking, George du Maurier. (We ought, perhaps, before this, to have said that none of our observations are to be taken as applying to the letterpress of the comic journal, which has probably never been fully appreciated in America.) It has employed other talents than his—notably Charles Keene, who is as broad, as jovial, as English (half his jokes are against Scotchmen), as Leech, but whose sense of the beautiful, the delicate, is inferior even to Leech's; and the wonderful Linley Sambourne, a genius quite apart, full of ingenuity and fancy, brilliant in execution, but wanting in the appearance and the love of reality, and more decorative, almost more mechan-

ical, than dramatic. But for a great many people, certainly in America, du Maurier has long been, as I say, the successor of Leech, the embodiment of the pictorial spirit of "Punch." Shut up in the narrow limits of black and white, without space, without color, without the larger opportunities, du Maurier has nevertheless established himself as an exquisite talent and a genuine artist. He is not so much of a laugher as Leech,—he deals in the smile, rather than the laugh,—but he is a much deeper observer, and he is a finer and nobler draughtsman. He has not Leech's animal spirits; a want of high spirits, a tendency to reflection, to lowness of tone, as his own Postlethwaite would say, is perhaps his limitation. But his seriousness—if he is too serious—is that of the satirist as distinguished from the simple joker; and if he reflects, he does so in the literal sense of the word—holds up a singularly polished and lucid mirror to the drama of English society. More than twenty years ago, when he began to draw in "Once a Week,"—that not very long-lived periodical which set out on its career with a high pictorial standard,—it was apparent that the careful young artist who finished his designs very highly and signed them with a French name, stood very much upon his own feet. The earliest things of his that we know have the quality which has made him distinguished to-day—the union of a great sense of beauty with a great sense of reality. It was apparent from the first that this was not a simple and uniform talent, but a gift that had sprung from a combination of sources. It is important to remember, in speaking of du Maurier,—who is one of the pillars of the British journal *par excellence*,—that he has French blood in his veins. George du Maurier, as we understand his history, was born in England, of a French father and an English mother, but was removed to France in his early years, and educated according to the customs of that country. Later, however, he returned to England; and it would not be difficult for a careful student of his drawings to guess that England is the land of his predilection. He has drawn a great many French figures, but he has drawn them as one who knows them rather than as one who loves them. He has perhaps been, as the phrase is, a little hard upon the French; at any rate, he has been decidedly easy for the English. The latter are assuredly a very handsome race; but, if we were to construct an image of them from the large majority of du Maurier's drawings, we should see before us a people of gods and goddesses. This does not alter the fact that there is a very Gallic element in some of du Maurier's gifts—his fineness of perception, his remarkable power of specifying types, his taste, his grace, his lightness, a certain refinement of art. It is hard to imagine that a talent so remarkable should not have given early evidences; but in spite of such evidences, du Maurier was, on the threshold of manhood, persuaded by those to whom it was his duty to listen, to turn his attention, as Mrs. Micawber says, to chemistry. He pursued this science without enthusiasm, though he had for some time a laboratory of his own. Before long, however, the laboratory was converted into a studio. His talent insisted on its liberty, and he committed himself to the plastic. He studied this charming element in Paris, at Düsseldorf; he began to work in London. This period of his life was marked by a great calamity, which has left its trace on his career and his work, and which it is needful to mention, in order to speak with any fairness of these things. Abruptly, without a warning, his eyesight partly forsook him, and his activity was cruelly threatened. It is a great pleasure, in alluding to this catastrophe, to be able to speak of it as a signal example of difficulty vanquished. George du Maurier was condemned to many dark days, at the end of which he learned that he should have to do his work for the rest of his life with less than half a man's portion of the sense most valuable to the artist. The beautiful work that he has produced in such abundance for so many years has been achieved under restrictions of vision which might well have made any work impossible. It is permitted, accordingly, to imagine that if the artist had had the usual resources we should not at the present moment be considering him simply as an accomplished draughtsman in black and white. It is impossible to look at many of his drawings without perceiving that they are full of the art of the painter, and that the form they have taken, charming as it has been, is arbitrary and inadequate.

John Leech died on October 27, 1864, and the first sketches in "Punch" that we recognize as du Maurier's appeared in that year. The very earliest that we have detected belong, indeed, to December 5, 1863. These beginnings are slight and sketchy head-pieces and vignettes; the first regular "picture" (with a legend beneath it) that we remember is of the date of June 11, 1864. It represents a tipsy waiter (or college servant), on a staircase, where he has smashed a trayful of crockery. We perceive nothing else of importance for some time after this, but suddenly his hand appears again in force, and from the summer of 1865 its appearances

are frequent. The finish and delicacy, the real elegance, of these early drawings, are extreme; the hand was already the hand of a brilliant executant. No such manner as this had hitherto been seen in "Punch." By the time one had recognized that it was not a happy accident, but an accomplished habit, it had become the great feature, the "attraction," of the comic journal. "Punch" had never before suspected that it was so artistic; had never taken itself, in such matters, so seriously. Much the larger part of du Maurier's work has been done for "Punch," but he has designed as well many illustrations for books. The most charming of these, perhaps, are the drawings he executed in 1868, for a new edition of Thackeray's "Esmond," which had been preceded several years before by a set of designs for Mrs. Gaskell's "Wives and Daughters," first ushered into the world as a serial in the "Cornhill." To the "Cornhill," for many years, du Maurier has every month contributed an illustration; he has reproduced every possible situation that is likely to be encountered in the English novel of manners; he has interpreted, pictorially, innumerable flirtations, wooings, philanderings, ruptures. The interest of the English novel of manners is often rather tranquil; the situations presented to the artist are apt to lack superficial strangeness. A lady and gentleman sitting in a drawing-room, a lady and gentleman going out to walk, a sad young woman watching at a sick-bed, a handsome young man lighting a cigarette—this is about the range of incident through which the designer may move. But in these drawing-room and flower-garden episodes, the artist is thoroughly at home; he accepts, of course, the material that is given him, but we fancy him much more easily representing quiet, harmonious things than depicting deeds of violence. It is a noticeable fact that in "Punch," where he has his liberty, he very seldom represents such deeds. His occasional departures from this habit are of a sportive and fantastic sort, in which he ceases to pretend to be real; like the dream of the timorous Jenkins (February 15, 1868), who sees himself hurled to destruction by a colossal, foreshortened cab-horse. Du Maurier's fantastic—we speak of the extreme manifestations of it—is always admirable, ingenious, unexpected, pictorial; so much so, that we have often wondered that he should not have cultivated this vein more largely. As a general thing, however, in these excursions into the impossible, it is some *charming* impossibility that he offers us—a picture of some happy contrivance which would make life more diverting; such as the playing of lawn-tennis on skates (on a lawn of ice), or the faculty on the part of young men on bicycles of carrying their sweethearts behind them on a pillion. We recommend the reader to turn to "Punch's" Almanac for 1865, in which two brilliant full-page illustrations represent the "Probable Results of the Acclimatization Society." Nothing could be fuller of delicate fancy and of pictorial facility than this prophecy of the domestication in the London streets, and by the Serpentine, of innumerable strange beasts—giraffes, ostriches, zebras, kangaroos, hippopotami, elephants, lions, and panthers. Apropos of strange beasts, the strangest of all, perhaps, is the wonderful big dog who has figured of late years in du Maurier's drawings, and who has probably passed, with many persons, as a kind of pictorial caprice. He is depicted as of such super-canine proportions, quite overshadowing and dwarfing the amiable family to whom he is represented as belonging, that he might be supposed to be another illustration of the artist's turn for the graceful grotesque. But, as it happens, he is not an invention, but a portrait—the portrait of a magnificent original, a literally gigantic St. Bernard, the property of the artist—the biggest, the handsomest, the most benignant of all domesticated shaggy things.

We think we are safe in saying that those ruder forms of incongruity which, as a general thing, constitute the stock-in-trade of the caricaturist, fail to commend themselves to this particular satirist. He is too fond of the beautiful—his great passion is for the lovely; not for what is called ideal beauty, which is usually a matter of not very successful guess-work, but for loveliness observed in the life and manners around us, and reproduced with a generous desire to represent it as usual. The French express a certain difference better than we; they talk of those who see *en beau* and those who see *en laid*. Du Maurier is as highly developed an example as we could desire of the former tendency—just as Cham and Daumier are examples of the latter; just, too, if we may venture to select instances from the staff of "Punch," as Charles Keene and Linley Sambourne are examples of the latter. Du Maurier can see ugliness wonderfully well when he has a strong motive for looking for it, as witness so many of the figures in his crusade against the "æsthetic" movement. Who could be uglier than Maudle and Postlethwaite, and all the other apparitions from "passionate Brompton"? Who could have more bulging foreheads, more protuberant eyes, more retreating jaws, more sloping shoulders, more objectionable hair, more of the signs generally of

personal debility? To say, as we said just now, that du Maurier carries his specification of types very far, is to say mainly that he defines with peculiar completeness his queer people, his failures, his grotesques. But it strikes us that it is just this vivid and affectionate appreciation of beauty that makes him do such justice to the eccentrics. We have heard his ugly creations called malignant—compared (to their disadvantage) with similar figures in Leech. Leech, it was said, is always good-natured and jovial, even in the excesses of caricature; whereas his successor (with a much greater brilliancy of execution) betrays, in dealing with the oddities of the human family, a taint of "French ferocity." We think the discrimination fallacious; and it is only because we do not believe du Maurier's reputation for amiability to be really in danger that we do not hasten to defend him from the charge of ferocity—French or English. The fact is, he attempts discriminations that Leech never dreamt of. Leech's characterizations are all simple, whereas du Maurier's are extremely complicated. He would like every one to be tall and straight and fair, to have a well-cut mouth and chin, a well-poised head, well-shaped legs, an air of nobleness, of happy development. He perceives, however, that nature plays us some dreadful tricks, and he measures her departure from these beautiful conditions with extreme displeasure. He regrets it with all the force of his appreciation of the beautiful, and he feels the strongest desire to indicate the culpability of the aberration. He has an artistic, æsthetic need to make ugly people as ugly as they are; he holds that such serious facts should not be superficially treated. And then, besides that, his fancy finds a real entertainment in the completeness, in the perfection, of certain forms of facial queerness. No one has rendered like du Maurier the ridiculous little people who crop up in the interstices of that huge and complicated London world. We have no such finished types as these in America. If the English find us all a little odd, oddity, in American society, never ripens and rounds itself off so perfectly as in some of these Old-World specimens. All those English terms of characterization which exist in America, at the most only as precarious exotics, but which are on every one's lips in England,—the snob, the cad, the prig, the duffer,—du Maurier has given us a thousand times the portrait of such specialties. No one has done the "duffer" so well; there are a hundred variations of the countenance of Mr. McJoseph, the gentleman who figured in "Punch" on the 19th August, 1876; or the even happier physiognomy of the other gentleman who, on the 2d November, 1872, says to a lady that he "never feels safe from the British snob till he is south of the Danube," and to whom the lady retorts, "And what do the South Danubians say?" This personage is in profile: his face is fat, complacent, cautious; his hair and whiskers have as many curves and flourishes as the signature of a writing-master; he is an incarnation of certain familiar elements of English life,—the "great middle class," the Philistinism,—the absence of irony, of the sentiment of art. Du Maurier is full of soft irony: he has that infusion of it which is indispensable to an artistic nature; and, we may add, that in this respect he seems to us more French than English. This quality has helped him immensely to find material in the so-called æsthetic movement of the last few years. None of his duffers have been so good as his æsthetic duffers. But of this episode we must wait a little to speak. The point that, for the moment, we wished to make is that he has a peculiar perception of the look of breeding, of race; and that, left to himself, as it were, he would ask nothing better than to make it the prerogative of all his characters. Only he is not left to himself. For, looking about into the world, he perceives his Gorgius Midas, and Mr. McJoseph, and the whole multitude of the vulgar, who have not been cultivated like orchids and race-horses. But his extreme inclination to give his figures the benefit of the supposition that most people have the feelings of gentlemen, makes him, as we began by saying, a very happy interpreter of those frequent works of fiction of which the action goes on, for the most part, in the drawing-room of the British country-house. Every drawing-room, unfortunately, is not a home of the Graces; but for the artist, given such an apartment, a group of quiet, well-shaped people is more or less implied. The "fashionable novel," as it flourished about 1830, is no more; and its extinction is not to be regretted. We believe it was rarely accompanied with illustrations; but if it were to be revived, du Maurier would be the man to make the pictures—the pictures of people rather slim and still, with long necks and limbs so straight that they look stiff, who might be treated with the amount of irony justified (if the fashionable novel of 1830 is to be believed) by their passion for talking bad French. The only trouble would be the superiority of his illustrations to the text.

We have been looking over the accumulations of "Punch" for the last twenty years, and du Maurier's work, which during this long period is remarkably abundant and various,

has given us more impressions than we can hope to put into form. The result of sitting for several hours at such a banquet of drollery, of poring over so many caricatures, of catching the point of so many jokes, is a kind of indigestion and giddiness. This is especially the case if one happens to be liable to confusions and lapses of memory. Every picture, every pleasantry, drives the last out of the mind, and even the figures we recall best get mixed up with another story than their own. The early drawings, as a general thing, are larger than the late ones; we believe that the artist was obliged to make them large in order to make them at all. (They were then photographed, much reduced, upon the block; and it is impossible to form an idea of the delicacy of du Maurier's work without having seen the designs themselves, which are in pen and ink.) Some of these full-page pictures have an admirable breadth and vigor, though they sometimes strike us as rather too black. This fault, however, is sometimes a merit; there are scenes which derive from it a look of color, an effect of atmosphere. As the years have gone on, the artist has apparently been able to make his drawing smaller, there has been less need of reducing it, and the full-page picture has become more rare. The wealth of execution was sometimes out of proportion to the jest beneath the cut; the joke might be as much or as little of a joke as one would; the picture was, at any rate, before all things a picture. What could be more charming than the drawing (October 24, 1868) of the unconscious Oriana and the ingenious Jones? It is a real work of art, a thing to have had the honors of color, and of the "line" at the Academy; and that the artist should have been able to give it to us for three-pence, on the reverse of a printed page, is a striking proof of his affluence. The unconscious Oriana—she is drawn very large—sits in the foreground, in the shadow of some rocks that ornament the sands at a bathing-place. Her beautiful hair falls over her shoulders (she has been taking her bath, and has hung her tresses out to dry), and her charming eyes are bent upon the second volume of a novel. The beach stretches away into the distance—with all the expression of space; and here the ingenious Jones carries out his little scheme of catching a portrait of the object—an object profoundly indifferent—of his adoration. He pretends to sit to an itinerant photographer, and apparently places himself in the line of the instrument, which in reality, thanks to a private understanding with the artist, is focused upon the figure of his mistress. There is not much landscape in du Maurier—the background is almost always an interior; but whenever he attempts an out-of-door scene, he does it admirably. What could be prettier, and at the same time more real, than the big view (September 9, 1876) of the low tide on Scarborough sands? We forget the joke, but we remember the scene—two or three figures, with their backs to us, leaning over a terrace or balcony in the foreground, and looking down at the great expanse of the uncovered beach, which is crowded with the activities of a populous bathing-place. The bathers, the walkers, the machines, the horses, the dogs, are seen with distinctness—a multitude of little black points—as under a magnifying-glass; the whole place looks vast and swarming, and the particular impression the artist wished to convey is thoroughly caught. The particular impression—that is the great point with du Maurier; his intuition is never vague; he likes to specify the place, the hour, the circumstances. "We forget the joke, but we remember the scene," we said just now. This may easily happen, as one looks over du Maurier's work; we frankly confess that, though he often amuses us, he never strikes us primarily as a joker. It is not the exuberance of his humor, but the purity of his line that arrests us, and we think of him much less as a purveyor of fun than as a charming draughtsman who has been led by circumstances to cultivate a vein of pleasantry. At every turn in his work, we find the fatal gift of beauty; by which we mean, that his people are so charming that their prettiness throws the legend into the shade. Beauty comes so easily to du Maurier that he lavishes it with unconscious freedom. If he represents Angelina reprimanding the housemaid, it is ten to one that Angelina will be a Juno and the housemaid a good deal of a Hebe. Whatever be the joke, this element of grace almost makes the picture serious. The point, of course, is not that Angelina should be lovely, but that the housemaid should be ridiculous; and you feel that, if you should call the artist's attention to this, he would reply: "I am really very sorry, but she is the plainest woman I can make—for the money!" This is what happens throughout—his women (and, we may add, his children) being monotonously, incorrigibly fair. He is exceedingly fond of children; he has represented them largely, at every age and in every attitude; but we can scarcely recall an instance of his making them anything but beautiful. They are always delightful—they are the nicest children in the world. They say droll things, but they never do ugly ones, and their whole child-world is harmonious and happy. We might have referred that critic

BRITISH PROPRIETY.

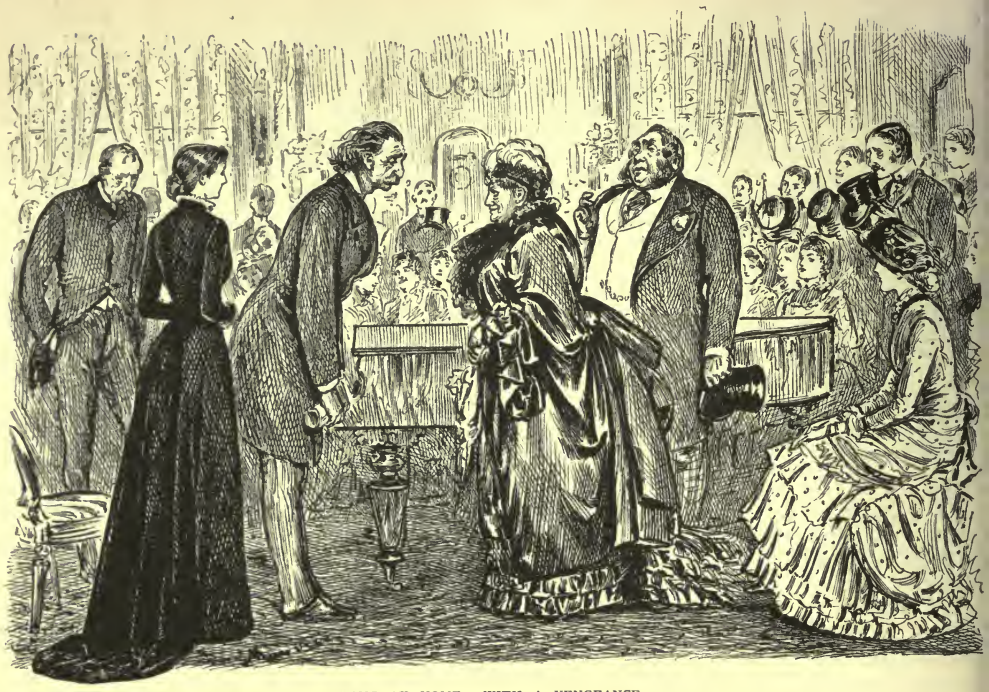
HAWKER: "Book o' the words, my Lady — Hortherised copy — the Dam o' Cameleers!"
MRS. JONES. (For the benefit of the by-standers): "Oh, no, thank you — we've come to see the *acting* — we do not wish to understand the *play!*"

whom we quoted above, who observed in du Maurier's manner the element of "ferocity," to the leniency of his treatment of the rising generation.

The children of Cham are little monsters; so are Daumier's; and the infants of Gavarni, with a grace of their own, like everything he drew, are simply rather diminutive and rather more sophisticated adults. Du Maurier is fond of large families, of the picturesqueness of the British nursery; he is a votary of the *culte du bébé*, and has never a happier touch than when he represents a blooming brood walking out in gradations of size. The pretty points of children are intimately known to him, and he throws them into high relief; he understands, moreover, the infant wardrobe as well as the infant mind. His little boys and girls are "turned out" with a completeness which has made the despair of many an American mother.

It may perhaps appear invidious to say that the little girls are even nicer than the little boys, but this is no more than natural, with the artist's delicate appreciation of female loveliness. It begins, to his vision, in the earliest periods, and goes on increasing till it is embodied in the stature of those slim Junos of whom we have spoken. It is easy to see that du Maurier is of the eminently justifiable opinion that nothing in the world is so fair as the fairness of fair women; and if so many of his women are fair, it is to be inferred that he has a secret for drawing out their advantages. This secret, indeed, is simply that fineness of perception of which we have already had occasion to speak, and to which it is necessary so often to refer.

He is evidently of the opinion that almost any woman has beauty if you look at her in the right way — carefully enough, intelligently enough; and that, *a fortiori*, the exceptionally handsome women contain treasures of plasticity. Feminine line and surface, curves of shoulder, stretches of arm, turns of head, undulations of step, are matters of attentive study to him; and his women have for the most part the art of looking as amiable and virtuous as they are pretty. We know a gentleman who, on being requested to inscribe himself on one of those formidable folios kept in certain houses, in which you indite the name of your favorite flower, favorite virtue, favorite historical character, wrote, in the compartment dedicated to the "favorite quality in a woman," the simple words — "Grace — grace — grace." Du Maurier might have been this gentleman, for his women are inveterately and imperturbably graceful. We



MUSIC AT HOME — WITH A VENGEANCE.

LADY MIDAS: How charmingly you play, Hare Leebart! Dear Mrs. Ponsonby de Tomkyns must really bring you down to play to us, at Midas Towers, our place in Surrey, you know, and — I will show you my roses, the finest roses in all England! Will Thursday suit you?"

HERR LIEBHARDT: "You are ferry vrently, matâme! pot I haf a wife and zix jiltren, and — zay to not lif upon Rôses!"

have heard people complain of it — complain, too, that they all look alike, that they are members of the same family. They have, indeed, a mutual resemblance; but when once the beautiful type has been found, we see no reason why, from a restless love of change, the artist should depart from it. We should feel as if du Maurier had been fickle and faithless if he were suddenly to cease to offer us the tall, tranquil persons he understands so well. They have an inestimable look of repose — an almost classic form. There is a figure in a cut, of which we have forgotten both the "point" and the date (we mention it at hazard — it is one in a hundred), which only needed to be modeled in clay to be a truly valuable creation. A couple of children address themselves to a youthful aunt, who leans her hand upon a toilet-table, presenting her back, clothed in a loose gown, not gathered in at the waist, to the spectator. Her charming pose, the way her head slowly turns, the beautiful folds of her robe, make her look more like a statuette in a museum than like a figure in "Punch." We have forgotten what the children are saying, but we remember her charming attitude, which is a capital example of the love of beauty for beauty's sake. The feeling of this — a feeling which constantly guides du Maurier's hand — is truly poetic.

The intention of these remarks has been supposed to be rather a view of du Maurier in his relation to English society than a technical estimate of his powers — a line of criticism to which we may already appear unduly to have committed ourselves. He is predominantly a painter of social, as distinguished from popular life, and when the other day he collected some of his drawings into a volume, he found it natural to give them the title of "English Society at Home." He looks at the "accomplished" classes more than at the people, though he by no means ignores the humors of humble life. His consideration of the peculiarities of costermongers and "cadgers" is comparatively perfunctory, as he is too fond of civilization and of the higher refinements of the grotesque. His colleague, the frank and, as the metaphysicians say, objective, Keene, has a more natural familiarity with the British populace. There is a whole side of English life at which du Maurier scarcely glances — the great sporting element, which supplies half of their gayety and all their conversation to millions of

her Majesty's subjects. He is shy of the turf and of the cricket-field; he only touches here and there upon the river. But he has made "society" completely his own—he has sounded its depths, explored its mysteries, discovered and divulged its secrets. His observation of these things is extraordinarily acute, and his illustrations, taken together, form a complete comedy of manners, in which the same personages constantly re-appear, so that we have the sense, indispensable to keenness of interest, of tracing their adventures to a climax. So many of the conditions of English life are picturesque (and, to American eyes, even romantic), that du Maurier has never been at a loss for subjects. He may have been at a loss for his joke—we hardly see how he could fail to be, at the rate at which he has been obliged to produce; but we repeat that to ourselves the joke is the least part of the affair. We mean that he is never at a loss for pictures. English society makes pictures all round him, and he has only to look to see the most charming things, which at the same time have the merit that you can always take the satirical view of them. He sees, for instance, the people in the Park; the crowd that gathers under the trees on June afternoons to watch the spectacle of the Row, with the slow, solemn jostle of the Drive going on behind it. Such a scene as this may be vain and unprofitable to a mind bent upon higher business, but it is full of material for the artist, who finds a fund of inspiration in the thousand figures, faces, types, accidents, attitudes. The way people stand and sit, the way they stroll and pause, the way they lean over the rail to talk to one of the riders, the way they stare and yawn and bore themselves—these things are charming to du Maurier, who always reproduces the *act* with wonderful fidelity. This we should bear in mind, having spoken above of his aversion to the violent. He has indeed a preference for quiet and gradual movements. But it is not in the least because he is not able to make the movement definite. No one represents a particular attitude better than he; and it is not too much to say that the less flagrant the attitude, the more latent its intention, the more successfully he represents it.

The postures people take while they are waiting for dinner, while they are thinking what to say, while they are pretending to listen to music, while they are making speeches they don't mean; the thousand strange and dreary expressions (of face and figure) which the detached mind may catch at any moment in wandering over a collection of people who are supposed to be amusing themselves in a superior manner—all this is entirely familiar to du Maurier; he renders it with inimitable fidelity. His is the detached mind—he takes refuge in the divine independence of art. He reproduces to the life the gentleman who is looking with extraordinary solemnity at his boots, the lady who is gazing with sudden rapture at the ceiling, the grimaces of fifty people who would be surprised at their reflection if the mirror were suddenly to be presented to them. In such scenes as these, of course, the comical mingles with the beautiful, and fond as du Maurier is of the beautiful, it is sometimes heroically sacrificed. At any rate, the comic effect is (in the drawing) never missed. The legend that accompanies it may sometimes appear to be wanting in the grossest drollery, but the expression of the figures is always such that you must say: "How he has hit it!" This is the kind of comedy in which du Maurier excels—the comedy of those social relations in which the incongruities are pressed beneath the surface, so that the scene has need of a certain amount of explanation. The explanation is often rather elaborate—in many cases one may almost fancy that the picture came first and the motive afterward. That is, it looks as if the artist, having seen a group of persons in certain positions, had said to himself: "They must—or at least they *may*—be saying so and so"; and then had represented these positions and affixed the interpretation. He passes over none of those occasions on which society congregates—the garden-party, the picnic, the flower-show, the polo-match (though he has not much cultivated the humors of sport, he has represented polo more than once, and he has done ample justice to lawn-tennis, just as he did it, years ago, to the charming, dawdling, "spooning" tedium of croquet, which he depicted as played only by the most adorable young women, with the most diminutive feet); but he introduces us more particularly to indoors entertainments—to the London dinner-party in all those variations which cover such a general sameness; to the afternoon tea, to the fashionable "squash," to the late and suffocating "small and early," to the scientific *conversazione*, to the evening with a little music. His musical parties are numerous and admirable—he has exposed in perfection the weak points of those entertainments: the infatuated tenor, bawling into the void of the public indifference; the air of lassitude that pervades the company; the woe-begone look of certain faces; the false and overacted attention of certain others; the young lady who is wishing to sing, and whose mamma is

BREAKING THE ICE.

GALLANT COLONEL (who has just been made a grandfather, and can talk of nothing else): "Do you take any interest in very young children, Miss Crauncher?"

FAIR AUTHORESS OF "A PAIR OF CAVALRY MOUSTACHES," &c., &c.: "I loathe *all* children! . . . . . ."

glaring at the young lady who *is* singing; the bristling heads of foreigners of the professional class, which stand out against the sleekness of British respectability. Du Maurier understands the foreigner as no caricaturist has done hitherto; and we hasten to add that his portraits of continental types are never caricatures. They are serious studies, in which the idiosyncrasies of the race in question are vividly presented. His Germans would be the best, if his French folk were not better still; but he has rendered most happily the aspect—and indeed the very temperament—of the German pianist. He has not often attempted the American; and the American reader who turns over the back volumes of "Punch" and encounters the luckless cartoons in which, during the long, weary years of the War, the primitive pencil of Mr. Tenniel contributed, at the expense of the American physiognomy, to the gayety of nations, will not perhaps regret that du Maurier should have avoided this particular field of portraiture. It is not, however, that he has not occasionally been inspired by the American girl, whom he endows with due prettiness, as in the case of the two transatlantic young ladies who, in the presence of a fine Alpine view, exclaim to a British admirer: "My! ain't it rustic?" As for the French, he knows them intimately, as he has a right to do. He thinks better of the English, of course· but his Frenchman is a very different affair from the Frenchman of Leech—the Frenchman who is sea-sick (as if it were the appanage of his race alone!) on the Channel steamer. In such a matter as this du Maurier is really psychological; he is versed in the qualities which illustrate the difference of race. He accentuates first, of course, the physical variation; he contrasts—with a subtlety which may not at first receive all the credit it deserves—the long, fair, English body, inclined to the bony, the lean, the angular, with the short, plump French personality, in which the neck is rarely a feature, in which the stomach is too much of one, in which the calves of the legs grow fat, in which in the women several of the joints, the wrists, the shape of the hand, are apt to be charming. Some of his happiest drawings are reminiscences of a midsummer sojourn at a French watering-place. We have long been in the habit of looking for "Punch" with peculiar impatience at this season of the year. When the artist goes to France he takes his big dog with him, and he has more than once commemorated the effect of this impressive member of a quiet English family upon the Norman and Breton populations. There have appeared at this time certain anecdotic

FAME!

EVANS EVANS, R. A., the famous artist, Knight of the Order of Merit in Germany, Officer of the Legion of Honor in France, &c., &c., &c., &c. . . visits his native place in Wales, and meets his first and only love, who married (alas!) the village doctor.

SHE: "Dear me! To think of our meeting again after so many years! How well I remember you! . . . . you used to go in for *painting*, and *sketching*, and all that . . . . and do you go in for it still?"

IT'S NOT SO DIFFICULT TO SPEAK FRENCH, AFTER ALL.

MISTRESS (fluently): "Oh-er-Françoise, il faut que vous alliez chez le chemist, dans High street, pour le gargle de Mademoiselle Maud — et chez le toy-shop, pour le lawn-tennis bat de Monsieur Malcolm — et n'oubliez pas mon waterproof, chez le cleaner, vis-à-vis l'underground railway-station — et dites à Smithson, le builder (dans Church Lane, à côté du public-house, vous savez), que le kitchen-boiler est — est — est — "

FRANÇOISE (who has been longer in England than her new mistress thinks): "Est *Burrrst!* Très bien, Madame."

pictures of English travelers in French towns, — in shops, markets, tram-cars, — in which some of the deeper disparities of the two peoples have been (under the guise of its being all a joke) very sufficiently exposed. Du Maurier, on the whole, does justice to the French; his English figures, in these international tableaux, by no means always come off best. When the English family of many persons troops into the *charcutier's*, or the perfumer's, and stands planted there, — mute, inexpressive, perpendicular, — the demonstrations, the professions, the abundant speech of the neat, plump, insinuating *boutiquière* are a well-intended tribute to the high civilization of her country. Du Maurier has done the "low" foreigner of the London (or of his native) streets, — the foreigner whose unspeakable baseness prompts the Anglo-Saxon observer to breathe the Pharisee's vow of thanks that he is not as these people are; but, as we have seen, he has done the low Englishman quite as well, — the 'Arry of the London music-halls, the companion of 'Andsome 'Arriet and Mr. Belville. Du Maurier's rendering of 'Arry's countenance, with its bloated purple bloom, of 'Arry's figure, carriage, and costume, — of his deportment at the fancy fair, where the professional beauties solicit his custom, — is a triumph of exactitude. One of the most poignant of the drawings that illustrate his ravages in our civilization is the large design which a year or two ago represented the narrow canal beneath the Bridge of Sighs. The hour is evening, and the period is the detested date at which the penny-steamer was launched upon the winding water-ways of the loveliest city in the world. The odious little vessel, belching forth a torrent of black smoke, passes under the covered arch which connects the ducal palace with the ducal prison. 'Andsome 'Arriet and Mr. Belville (personally conducted) are of course on board, and 'Arriet remarks that the Bridge of Sighs isn't much of a size, after all. To which her companion rejoins that it has been immortalized by Byron, any way — "'im as wrote 'Our Boys,' you know." This fragment of dialogue expresses concisely the arguments both for and against the importation of the cheap and easy into Venetian waters.

Returning, for a moment, to du Maurier's sketches of the French, we must recall the really interesting design in which, at a childs' party at the Casino of a *station balnéaire*, a

THE HEIGHT OF ÆSTHETIC EXCLUSIVENESS.

MAMMA: "Who are those extraordinary looking children?"
EFFIE: "The Cimabue Browns, Mamma — they're *æsthetic*, you know!"
MAMMA: "So I should imagine. Do you know them to speak to?"
EFFIE: "Oh, *dear* no, Mamma — they're most *exclusive* — why, they put out their tongues at us if we only *look* at them!"

number of little natives are inviting a group of English children to dance. The French children have much the better manners; they make their little bows with a smile, they click their heels together, and crook their little arms as they offer them to their partners. The sturdy British infants are dumb, mistrustful, vaguely bewildered. Presently you perceive that in the very smart attire of the gracious little Gauls *everything is wrong*— their high heels, their poor little legs, at once too bare and too much covered, their superfluous sashes and scarfs. The small English are invested in plain Jerseys and knickerbockers. The whole thing is a pearl of observation, of reflection. Let us recall, also, the rebuke administered to M. Dubois, the distinguished young man of science, who, just arrived from Paris and invited to dine by the Duke of Stilton, mentions this latter fact in apology for being late to a gentleman to whose house he goes on leaving the Duke's. This gentleman, assisted by Mr. Grigsby (both of them specimens of the snob-philistine which du Maurier has brought to such perfection), reprehends him in a superior manner for his rashness, reminds him that in England it is "not usual for a professional man" to allude in that promiscuous manner to having dined with a duke—a privilege which Grigsby characterizes "the perfection of consummate achievement." The advantage is here with poor M. Dubois, who is a natural and sympathetic figure, a very nice little Frenchman. The advantage is doubtless also with Mlle. Serrurier and her mother, though Mademoiselle is not very pretty, in a scene in which, just after the young lady has been singing at Mrs. Ponsonby de Tomkyns's, the clever Mrs. Ponsonby plays her off on the Duchess (as an inducement to come to another party), and then plays the Duchess off on the little vocalist and her mother, who, in order to secure the patronage of the Duchess, promise to come to the entertainment in question. The clever Mrs. Ponsonby thus gets both the Duchess and the vocalist for nothing. The broad-faced young French girl, with small, salient eyes, her countenance treated in the simplest and surest manner, is a capital specimen of du Maurier's skill in race-portraiture; and though they may be a knowing couple in their way, we are sure that she and her mamma are incapable of the machinations of Mrs. Ponsonby de Tomkyns.

This lady is a real creation. She is an incident of one of the later phases of du Maurier's activity—a child of the age which has also produced Mrs. Cimabue Brown and Messrs. Maudle and Postlethwaite. She is not one of the heroines of the æsthetic movement, though we may be sure she dabbles in that movement so far as it pays to do so. Mrs. Ponsonby de Tomkyns is a little of every-

thing, in so far as anything pays. She is always on the look-out, she never misses an opportunity. She is not a specialist, for that cuts off too many opportunities, and the æsthetic people have the *tort*, as the French say, to be specialists. No, Mrs. Ponsonby de Tomkyns is—what shall we call her?—well, she is the modern social spirit. She is prepared for everything; she is ready to take advantage of everything; she would invite Mr. Bradlaugh to dinner if she thought the Duchess would come to meet him. The Duchess is her great achievement—she never lets go of her Duchess. She is young, very nice looking, slim, graceful, indefatigable. She tires poor Ponsonby completely out; she can keep going for hours after poor Ponsonby is reduced to stupefaction. This unfortunate husband is, indeed, almost always stupefied. He is not, like his wife, a person of imagination. She leaves him far behind, though he is so dull and heavy that, if she were a less superior person, he would have been a sad incumbrance. He always figures in the corner of the scenes in which she distinguishes herself, separated from her by something like the gulf that separated Caliban from Ariel. He has his hands in his pockets, his head poked forward; what is going on is quite beyond his comprehension. He vaguely wonders what his wife will do next; her maneuvers quite transcend him. Mrs. Ponsonby de Tomkyns always succeeds. She is never at fault; she is as quick as the instinct of self-preservation. She is the little London lady who is determined to be a greater one. She pushes, pushes, gently but firmly—always pushes. At last she arrives. It is true that she had only the other day, on June 29, 1882, a considerable failure; we refer the reader to the little incident of Madame Gaminot, in the "Punch" for that date. But she will recover from it; she has already recovered from it. She is not even afraid of Sir Gorgius Midas—of the dreadful Midas junior. She pretends to think Lady Midas the most elegant of women; when it is necessary to flatter, she lays it on as with a trowel. She hesitates at nothing; she is very modern. If she doesn't take the æsthetic line more than is necessary, she finds it necessary to take it a little; for, if we are to believe du Maurier, the passion for strange raiment and blue china has, during the last few years, made ravages in the London world. We may be sure that Mrs. Ponsonby de Tomkyns has an array of fragile disks attached to her walls, and that she can put in a word about Botticelli at the right moment. She is far, however, from being a representative of æstheticism, for her hair is very neatly arranged, and her dress looks French and superficial. In Mrs. Cimabue Brown we see the priestess of the æsthetic cult, and this lady is, on the whole, a different sort of person. She knows less about duchesses, but she knows more about dados. Du Maurier's good-natured "chaff" of the eccentricities of the plastic sense so newly and so strangely awakened in England, has perhaps been the most brilliant episode of his long connection with "Punch." He has invented Mrs. Cimabue Brown—he has invented Maudle and Postlethwaite. These remarkable people have had great success in America, and have contributed not a little to the curiosity felt in that country on the subject of the English Renascence. Strange rumors and legends in relation to this great movement had made their way across the Atlantic; the sayings and doings of a mysterious body of people, devotees of the lovely and the precious, living in goodly houses and walking in gracious garments, were repeated and studied in our simpler civilization. There has not been as yet an American Renascence, in spite of the taste for "sincere sideboards" and fragments of crockery. American interiors are, perhaps, to-day as "gracious" as English; but the movement in the United States has stopped at household furniture, has not yet set its mark upon speech and costume—much less upon the human physiognomy. Du Maurier, of course, has lent a good deal of his own fame to the vagaries he depicts; but it is certain that the new æsthetic life has had a good deal of reality. A great many people have discovered themselves to be fitted for it both by nature and by grace; so that noses and chins, facial angles of every sort, shaped according to this higher rule, have become frequent in London society. This reaction of taste upon nature is really a marvel; and the miracle has not been repeated in America, nor, so far as we know, upon the continent of Europe. The love of Botticelli has actually remolded the features of many persons. London, for several seasons, was full of Botticelli women, with wan cheeks and weary eyes, enveloped in mystical, crumpled robes. Their language was apt to correspond with their faces; they talked in strange accents, with melancholy murmurs and cadences. They announced a gospel of joy; but their expression, their manners, were joyless. These peculiarities did not cross the ocean; for somehow the soil of the Western World was not as yet prepared for them. American ladies were even heard to declare that there was something in their constitution that would prevent their ever dressing like that. They had another ideal—they had too much coquetry. But meanwhile,

BARBAROUS TECHNICALITIES OF LAWN TENNIS.

WOOLWICH CADET (suddenly to his Grandmother, who has had army on the brain ever since he passed his exam.): "The service is awfully severe, by Jove! Look at Colonel Pendragon. He invariably shoots or hangs!"
HIS POOR GRANDMOTHER: "Good Heavens, Algy! I hope you wont be in *his* regiment!"

as I say, there was something irritating, fascinating, mystifying, in the light thrown on the subject by "Punch." It seemed to many persons to be desired that we too should have a gospel of joy; American life was not particularly "gracious," and if only the wind could be made to blow from the æsthetic quarter, a great many dry places would be refreshed. These desires, perhaps, have subsided; for "Punch" of late has rather neglected the Renascence. Mrs. Cimabue Brown is advancing in years, and Messrs. Maudle and Postlethwaite have been through all their paces. The new æsthetic life, in short, shows signs of drawing to a close, after having, as many people tell us, effected a revolution in English taste—having at least, if not peopled the land with beauty, made certain consecrated forms of ugliness henceforth impossible.

The whole affair has been very curious, and we think very characteristic of the English mind. The same episode, fifty times repeated—a hundred "revolutions of taste," accompanied with an infinite expenditure of money—would fail to convince certain observant and possibly too skeptical strangers, that the English are an æsthetic people. They have not a spontaneous artistic life; their taste is a matter of conscience, reflection, duty, and the writer who in our time has appealed to them most eloquently on behalf of art has rested his plea on moral standards of right and wrong. It is impossible to live much among them, to be a spectator of their habits, their manners, their arrangements, without perceiving that the artistic point of view is the last that they naturally take. The sense of form is not part of their constitution. They arrive at it, as they have arrived at so many things, because they are ambitious, resolute, enlightened, fond of difficulties; but there is always a strange element, either of undue apology or of exaggerated defiance, in their attempts at the cultivation of beauty. They carry on their huge, broad back a nameless mountain of conventions and prejudices, a dusky cloud of inaptitudes and fears, which casts a shadow upon the frank and confident practice of art. The consequence of all this is that their revivals of taste are even stranger than the abuses they are meant to correct. They are violent, voluntary, mechanical; wanting in grace, in tact, in the sense of humor and of proportion. A genuine artist like du Maurier could not fail to perceive all this, and to perceive also that it gave him a capital opportunity. None of his queer people are so queer as some of these perverted votaries of joy.

"Excuse me, it is not a Botticelli — before a Botticelli I am dumb," one of them says to a poor, plain man, who shows him a picture which has been attributed to that master. We have said already, and repeated, that Du Maurier has a great deal of irony — the irony of the thorough-going artist, and of the observer who has a strain of Gallic blood in his veins. There are certain pretensions that such a mind can never take seriously; in the artist there is of necessity, as it seems to us, a touch of the democrat — though, perhaps, he is as unlikely to have more than a certain dose of this disposition as he is to be wholly without it. Some of his drawings seem to us to have for the public he addresses a stinging democratic meaning; like the adventure of M. Dubois (of whom we have spoken), who had had the inconvenience of dining with a duke; or the reply of the young man to whom Miss Midas remarks that he is the first commoner she has ever danced with: "And why is it the commoners have avoided you so?" — or the response of the German *savant* to Mrs. Lyon Hunter, who invites him to dine, without his wife, though she is on his arm, to meet various great ladies whom she enumerates: "And pray, do you think they would not be respectable company for my wife?" Du Maurier possesses in perfection the genuine artist's perception of the snobbish. We have said, however, that the morality, so to speak, of his drawings, was a subordinate question; what we wished to insist upon is their completeness, their grace, their beauty, their rare pictorial character. It is an accident that the author of such things should not have been a painter — that he has not been an ornament of the English school. Indeed, with the restrictions to which he has so well accommodated himself, he *is* such an ornament. No English artistic work in these latter years has, in our opinion, been more exquisite in quality.

Henry James, Jr.

THE CHRISTIAN LEAGUE OF CONNECTICUT.*

THIRD ANNUAL CONVENTION.

BY WASHINGTON GLADDEN.

It was a bright afternoon in early November; the keen west wind was making a great stir among the tough brown leaves in the oak-grove near by, and the prophecy of a sharp frost was in the air, while the Reverend Theodore Strong and his friend Walter Franklin walked briskly up and down the platform of the railway station at Potsdam Junction. They were waiting for the Southern express, due in a few minutes, which was to carry them to Bradford.

"Is your programme ready?" asked the clergyman.

"Substantially," answered the banker. "The evening session is to be occupied by the address of Dr. Upson, followed by a social reunion in the parlors of his church."

"Upson presides, does he?"

"He does. Our rule is, you know, that the oldest pastor in the place where the convention is held shall take the chair at the meetings. This rule was adopted without thinking of the Methodists, but it doesn't work badly, after all. This is the third annual convention of the League, and Dr. Upson will be the second presiding officer furnished by the Methodists. It is his ninth year in Bradford — the third year of his second term with his present charge, and he served another church for three years between the two terms. So he happens to be the Bradford pastor longest in continuous service."

"I am glad of it," answered Mr. Strong. "He is a hearty and positive man; he believes in the League, and he will be sure to give us a breezy and stirring meeting. But what are we to have to-morrow?"

"Devotional hour from eight to nine; reports from county leagues, followed by conversation, for the forenoon session; two papers read and discussed at the afternoon session, and a public meeting in the evening, with three or four short speeches."

"This League gives you a great deal of work, old fellow; added to all your other cares, it must burden you not a little. You must not let it make you its victim."

* See articles under the same title, in THE CENTURY for November and December, 1882, and January, 1883.

"Oh, no. This is my diversion. I like it better than a yacht or a stock-farm; it costs me less money and less worry than Thompson's fish-pond costs him—and that is his recreation, you know. Some of our directors laugh a little at my way of amusing myself, but the laugh is not always wholly on their side. I get about as much enjoyment out of my hobby as any of them gets out of his."

"I believe you," responded Mr. Strong, heartily. "I have often thought that business men might find, in philanthropic enterprises of one sort or another, not less diversion and more wholesome enjoyment than they derive from their various expensive relaxations. But there's the whistle."

In a few moments the train stopped at the junction. At the broad window of one of the palace-cars sat a ruddy-faced gentleman, in a loose gray traveling-suit, looking out at the group of passengers and gazers on the platform. His eye fell on the parson, and instantly he raised the window and shouted:

"Ho, there, my friend!"

Mr. Strong's eye was lifted to the window, and he answered the salutation by springing to the platform of the car. Franklin followed him. The stranger met him at the door and greeted him warmly.

"Bless my soul!" he cried, "this is indeed an unexpected pleasure. I wondered much, on my way over, whether I should see you; but I had not your address, and did not know where to look for you in all this vast country. You remember how unexpected was our parting?"

"I remember well," replied the parson, heartily. "This meeting is just as unexpected and far more welcome. But allow me to introduce my friend, Mr. Franklin. This is Mr. Thornton, an English gentleman with whom I journeyed from Acre to Damascus."

"And for whom," interrupted the stranger, "you so kindly cared when he was prostrated by the heat. I owe much to your friend, Mr. Franklin."

"So do many of us," answered the banker, sententiously.

"But when did you arrive on these shores?" asked the parson.

"The day before yesterday."

"Is it your first visit to America?"

"It is the first."

"And how far are you going on this train?"

"Only to Bradford. It is the next station, I believe."

"It is, and it is our destination also."

"Good!"

The Englishman paused a moment, and then said:

"I am on my way to a convention in that city of what is called the Christian League. You know of it, I dare say."

"Oh, yes; Mr. Franklin, here, is the father of it."

"Bless my soul! This is Mr. Walter Franklin! and you are the Rev. *Theodore* Strong! Well, well! I have often wondered, as I read in the English papers the doings of the club, whether my sometime friend in Damascus could be the Mr. Strong of New Albion. The name was the same, but I hardly thought it the same man. This doubles the delight of the meeting. And you, sir," turning to Mr. Franklin, "are to be profoundly congratulated. The Christian League is a child of which a man has a right to be proud."

"Oh, that is Strong's extravagance," protested Franklin. "The Christian League, unlike the Corinthian Church, has many fathers. I am only serving it as a sort of dry nurse for the time being."

"We know all about that!" exclaimed the Englishman. "The history of the League is quite familiar to many on the other side of the sea. As good luck would have it, I saw the announcement of your convention in one of the New York newspapers yesterday, and at once resolved to be present. Are you the President of the League?"

"No; the league has no officers, save a business committee appointed at each meeting to make arrangements for the next. We pass no votes and keep no records. We meet simply for conference and discussion. I have served, thus far, as the Secretary of the Business Committee; they have done me the honor to reappoint me year by year; that is the only office I hold."

"And that," interposed Mr. Strong, "is no sinecure, as you may guess. The prosperity of the League is largely due to the abundant and gratuitous labors of my friend. That will be plain to you before the meeting is ended. But here we are at Bradford."

A delegation from the Bradford League was at the station to receive them, and the Englishman, protesting, was carried off by his friends to their lodgings.

At seven o'clock, when the three appeared at the door of the spacious social parlors of the Summerfield Methodist Church, where the meeting was to be held, they found some scores of gentlemen and ladies gathered in groups, and filling the room with the noise of conversation and laughter. Recognitions, greetings, introductions, showed that these were delegates to the convention, who had come from various parts of the State, who were not altogether unacquainted, and among whom it was easy to establish the bond of a cordial

fellowship. Mr. Franklin and Mr. Strong were quickly surrounded and warmly welcomed. To extricate Mr. Thornton from the throng that pressed around them, Mr. Strong put him in charge of Mr. Stanley, rector of the Episcopal Church in Waterport, who was standing near.

"I myself am a Churchman," said the Englishman, as the two walked away to a quiet nook, "and the doings of this league have greatly interested me. There is need enough, in our country, of coöperation among Christians, and I have come to this meeting to see whether its methods would be at all practicable in England."

"I do not know how that would be," answered the rector; "but I can think of no reason why they would not work with you as well as with us. 'Sweetness and light' are the only weapons of our warfare; if your arsenals are not full of these, one of your countrymen is not to blame. We disseminate information; we bring Christian people of all names together to talk about the work in which they are all engaged; we try to promote unity and good-will among them. Such methods as these ought to be feasible in England."

"They ought to be, indeed," replied Mr. Thornton; "but there are so many technical and formal difficulties. For example, there is the everlasting fuss about orders; how do you manage that?"

"We have nothing to do with orders," answered the clergyman. "There is no occasion, whatever, for raising any such question. Nobody takes orders and nobody gives orders. We do nothing in our clubs, nor in this league, as ministers or as churches. We meet simply as Christian neighbors to confer about our work and the best ways of promoting it."

"But your genuine High Churchman never could take part in any such conferences."

"I don't know about that. Of course, the High Churchman who really thinks that these religious societies of the Baptists and the Congregationalists and the Methodists are not only irregular but irreligious bodies, and that they ought to be resisted and extirpated, could not have anything to do with our league; but there are few High Churchmen, I fancy, who ever go as far as that. I myself am thought, by some of my brethren, to be a pretty rigid Churchman; but I am quite ready to admit that these other religious bodies are doing efficient Christian work; and when such an organization is occupying any field, preaching the Gospel to the people, and helping them to lead pure and upright lives, I do not think that Churchmen are called to enter that field, to divide and scatter the forces there at work. It is far better for us to spend our strength on some destitute neighborhood. I cannot quite admit that these religious societies are genuine churches, or that their ministers are properly ordained; but what of that? You may call them what you will — conventicles or debating societies; the question is not what name they ought to bear, but what they are doing; and if your conventicle or your debating society is making men act like Christians, then I think we Churchmen had better not tear it into pieces, that we may build a 'regularly organized' church out of its ruins. There is better business for us, I am sure."

"Hear, hear!" responded Mr. Thornton. "Well, that is all that this league stands for. It promotes comity and coöperation among Christians of different names. It asks me to do nothing more than Archbishop Tait, of Canterbury, the Primate of all England, has done more than once, as you know. He has repeatedly welcomed and invited conferences with dissenters, for the more effectual prosecution of religious work."

"You speak truth," assented the Englishman. "And I can see no reason why some such measures might not be adopted in my own country. Your league, as I understand it, is only a device for generating and guiding public sentiment."

"That is all; and this is done simply by bringing Christian people together, putting the facts before them, and inducing them to talk them over. But the bell is tolling for the evening service; let us find seats in the church."

Dr. Upson's opening address was a spirited and enthusiastic one, but there is no room for it in these chronicles. After the address, the reunion proceeded, the citizens of Bradford being present in force to welcome the delegates. It was delightful to witness the unconstrained and hearty manners of the company; nobody seemed to have a burden on his mind; there were no knots of slate-makers or wire-pullers; no one had a pet measure that he wanted to put through the convention on the next day; no one expected any office; in all these respects it was quite unlike the preliminary meetings of many ecclesiastical bodies; and to this difference was due in part, no doubt, the excellent temper of the members.

The morning prayer meeting was almost wholly devotional. To singing and prayer, more than to speech-making, the hour was devoted; the old hymns that express the unity of the Church were sung with a wholesome fervor; the prayers laid hold upon the words

of the Intercessor, "that they all may be one," as if they really expected that the answer would come.

Promptly, at the hour of nine, Mr. Franklin called the convention to order:

"We are hampered by no formalities," he said; "we are ready to proceed at once to business. According to our unwritten rule, the duty of presiding at this meeting falls to the Rev. Dr. Upson, in whose church we meet, and he will now take the chair."

"The Business Committee recommend," said the chairman, mounting the platform, "that the forenoon until half-past twelve be given to reports from the county committees and to conversation about them — fifteen minutes to each report, which may be oral or written; ten minutes to the discussion of it. Of course, there is no room for speeches; but some of you will want to ask questions of the persons reporting, for further explanation of portions of their report. We want you to get your questions into definite shape before you present them. A great many questions can be asked and answered in ten minutes, if no words are wasted. Brother Dickinson, you have the floor."

The secretary from Midland County, thus addressed, rose and began the reading of his report, which we summarize:

Of the twenty-nine towns and cities in the county, twenty-two have coöperated during the last year in the work of the County League. In all the large towns League clubs have been formed; and in the small towns, the work of consolidation has been steadily advancing. The county contains a population of seventy thousand. Two years ago there were one hundred and fourteen regularly organized churches in this county, besides various missions and congregations of a more or less ephemeral character. Of these churches, forty-one were in the cities and towns with over five thousand inhabitants; the remaining seventy-three were in the smaller towns. The large towns and cities contain about forty-five thousand people; the small towns about twenty-five thousand. In the large towns and cities, there was about one church to every twelve hundred inhabitants; in the smaller towns there was about one to every three hundred and fifty inhabitants. Now, there are but ninety-three churches in the county, a reduction of twenty-one in the whole number. (Applause.) In the cities and large towns, four churches have been disbanded, none of which had any other than sectarian reasons for its existence, and eight new ones have been formed, making a gain of four churches in the denser populations. In the small towns, twenty-five churches have been disbanded and no new ones formed, so that in these sparser populations there is now about one church for every five hundred persons. (Applause.) Statistics, so far as procurable, indicate that, with the decrease in the number of churches, there has been an increase of from eight to ten per cent. in the number of regular worshipers, the movement toward consolidation having enlisted the interest of many persons who had previously remained outside of all churches, quite a number of them being men of intelligence and property, to whom the sectarian divisions had always been a stumbling-block.

In all the towns where churches were consolidated, a movement was at once set on foot to establish mission services in districts distant from the church, and these were generally well attended and useful; but several towns have settled upon a method which seems to be more successful. It is that of bringing the people to the central place of worship, instead of sending the Gospel to them. In the town of Summit, three four-horse teams, coming by different roads, bring to church every Sunday morning about fifty persons, none of whom had previously been in the habit of attending church. The teams are furnished by farmers in each neighborhood; the farm wagons have been provided with springs and comfortable seats, and the invitation has been extended to all the people living on the roads through which these conveyances pass to make use of them in going to church. Every house was visited, the poorest people were made to feel that they would be welcome, and in some cases aid was quietly given to families who found it difficult to provide their children with suitable clothing. The result is a great increase in the attendance at the church in the center of the town. Quite a number of the farmers who have conveyances of their own, but have never used them on Sunday, have been stirred up to attend church, and the four-horse teams are accompanied by a goodly number of smaller vehicles. The old horse-sheds in the rear of the meeting-house are filled every Sunday. This policy of concentration seems to be gaining in favor in Midland County. It is thought to work better than the plan of holding many small meetings in the separate neighborhoods. The school-houses are not always comfortable; the lights are dim, the singing drags, the attendance in each place is small. The central church, on the other hand, is commodious and cheerful; there is an organ or some other instrument, and a choir to lead the singing; and the greatly increased attendance doubles the interest and enthusiasm of the auditors, stimulates the preacher to do his best, and increases the

moral effect of the whole service. Instead of distributing the broken meats of the Gospel feast to the people in the out-districts, the people themselves are brought to the first table and enjoy the best that the house affords. This tends wonderfully to strengthen the feeling of community between different parts of the town, and to prevent local jealousies and feuds. It is pleasant and useful for the people of all parts of the town to meet thus once a week. Those who advocate this method point also to the fact that, in thus drawing the whole town together at one central place of worship, they are only restoring the practices of the earlier days, when these country towns were much more populous and prosperous than they now are.

Mr. Dickinson's report was received with a round of applause.

"Now, for your questions!" cried the chairman. "The report has occupied only thirteen minutes; you have twelve minutes for talk. Stand up, Brother Dickinson! Go on, brethren!"

"Is there only one church in this town of Summit?"

"Only one. Five of our country towns have but one church apiece!"

"What kind of church is it?" The question came from two or three parts of the room at the same time.

"It is called, I believe, 'The Church of Christ in Summit.'"

"Were there other churches in the town formerly?"

"Yes; there were three churches, two years ago."

"What has become of the buildings?"

"The Congregational church stood in a breezy place on the top of the highest hill; it was bought and remodeled for a summer boarding-house. The Baptist church is vacant. The Methodist church, renovated, is the one now occupied."

"Is that old vacant Baptist church a pleasant object to look upon?" asked one elderly, quiet-faced man, who rose up under the gallery.

"No, it is not," answered Mr. Dickinson, with some feeling. "It is to me a very melancholy spectacle. Some of the shutters have been torn off, and many panes of glass have been broken from the windows. The thought of what it is likely to become fills me with pain. My boyhood was spent in Summit, and I was a worshiper in that old church. I do not like to see it falling into ruin."

"There is another such vacant church in our town," continued the old gentleman; "ours is a Congregational church, the church in which I used to worship when I was a boy; the church where I stood up to confess my faith; the church where my father served for many years as deacon, and from whose doors he was carried out to be buried. I am glad of the union which has brought the Christians of our town all together again as in the olden time; I praise God for it every day; I am perfectly at home in our new union church, which stands in the factory village; but the sight of that dear old church, falling into decay and desolation, is a perpetual sorrow to me. I know of three other towns in our county where the same melancholy spectacle may be seen. The movement toward consolidation leaves on many of our hills dear and venerable churches to be hiding-places for the moles and the bats, and sometimes for worse vermin. Forgive me for speaking so long, but I want to raise this question: What should be done with vacant churches?"

The responses from all parts of the room showed that the question had touched the hearts of the delegates. There was a short pause. Finally, the chairman spoke:

"What answer do we hear from Midland County?"

"It is a question on which I myself wish to be enlightened," answered Mr. Dickinson.

"If the convention will permit me to prophesy," said the chairman, "I will venture the prediction that the report from Dunham County will deal with this subject. It may be well to wait for that. Indeed, the twelve minutes are all gone but one, and I propose that we devote that minute to singing the verse:

"I love thy Church, O God!
Her walls before thee stand,
Dear as the apple of thine eye,
And graven on thine hand."

After the singing of this stanza with deep feeling, Mr. Hubbard, the secretary of the Dunham County League, began his report: The results have been somewhat less favorable than those contained in the preceding report, but there is still abundant reason for encouragement in the reduction of the number of small churches, in the great increase of church attendance, and in the effectiveness of the new methods of reaching the churchless classes. That part of Mr. Hubbard's report to which the chairman referred, we reproduce entire:

"We have had troubles of our own with vacant churches; troubles not merely sentimental, but practical. The consolidation in the town of Liberty left the Methodist church vacant; and it was not only an offense to the eyes and a trouble to the heart, as every vacant church must be, but it became the haunt of tramps, and was a scandal to the community. At

length the good people determined to abate the nuisance in some way, and a meeting of the citizens was called in the old church itself, one evening last August, to consider what should be done with it. Among those who came to the meeting were several city people who were spending the summer in Liberty, some of whom were natives of the town. Various uses of the old sanctuary were suggested. One of the farmers offered one hundred dollars for it, to be used as a barn; but the offer was not entertained. One heroic brother wanted to burn it up at once; it had outlived its usefulness, he said, and might better be solemnly devoted to God as a burnt-offering, than to live to be a disgrace and a pest to the community. This proposition pleased some of the more enthusiastic Christians and all the boys, and it was on the point of being adopted, when Judge Forsyth, of New York, arose and made a little speech.

"'It seems to me,' he said, 'that you can put this church to a better use. I do not like to see valuable property destroyed, and I have personal reasons for not wishing that the church in which I worshiped when a boy should come to such an end. You need a parsonage and parish house, a home for your minister and a social center for the community. This building can be remodeled at no great cost, so that it shall serve this double purpose. I have had my friend Mr. Garland, the architect, who is here to-night, make a plan for this reconstruction, which he will show you. The walls of the building are high enough to admit of two stories; the two rows of windows lend themselves to the plan; a floor can be thrown across, at about the height of the gallery floor; the lower story can be divided into rooms suitable for the parsonage; above you can have your parish hall, for lectures, concerts, sociables, literary meetings, etc., with a room for the library which I hope you will have by and by, and of which your pastor should have the care. Mr. Garland tells me that the change in the building can be made according to his plan for about fifteen hundred dollars; and I am prepared to say that if the community will pledge five hundred dollars of that amount, I will furnish the rest.'

"The offer of Judge Forsyth was received with loud applause; the five hundred dollars was pledged at once, the carpenters were soon at work, and the pastor is now living in his parsonage, while the parish is rejoicing in such a place of social assembly as every country parish needs. I have heard that some other wealthy gentlemen, natives of Liberty, now residing in Boston, are proposing to endow the library at which Judge Forsyth hinted, and for which a room was provided in the reconstructed building.

"Thus one of our old churches has been converted and saved from ruin in its old age. But there was more serious trouble in Hector. There it was the old Baptist church that was abandoned, and the kind of tramps that it harbored were mostly religious tramps. Unluckily there were a few members of that church who proved incorrigible when the Union was formed; they opposed it to the end, and in the face of an overwhelming public sentiment they continued to oppose it after it was an accomplished fact. These irreconcilables were determined to keep up some kind of sectarian division in the community, and they used the old church as their base of operations. The same tactics have been resorted to in other towns. A vacant church acts on the mind of your religious demagogue as a powerful stimulant. He wants to use it for schismatic purposes. He cannot rest till he has gathered his awkward and ugly squad of sectaries within its walls. Very likely, too, he will name his schism shop a 'Union Church.' Many an enterprise of this nature, whose only effect could be to divide and weaken the Christian community, has been baptized with the Union name. So it was in Hector. First a traveling Baptist minister came along and held 'Union' services in the old church for a few weeks; but it was not long before he discerned the true character of his supporters and turned his back upon them. Their next resort was a Congregationalist from Bradford, who goeth about as a roaring layman, seeking whom he may exhort. His excuse for invading Hector was the lack of orthodoxy in the pulpit of the village church, and he began his campaign by attacking the 'loose doctrines' and the heretical tendencies of the pastor. But a lawyer of Hector, who had some knowledge of this heresy-hunter's business operations, made a brief statement in the county newspaper, and the fellow had the grace to take himself off. After him came a band of Adventists, with a series of meetings, and after them an itinerant Universalist, who tried to get up a discussion of his peculiar doctrines, and challenged the pastor to a controversy; but the night after his first meeting—a cold, winter night—the stove was left open, a spark set it on fire, and the old church was saved from being the kennel of schismatics, yet so as by fire. But the fate of this and other vacant churches in our county has warned us against leaving in our rear, as we march toward Christian union, such a fortress of schism as a vacant church may become. Henceforth we are determined to find some good use for every church that is vacated; it might far better be devoted to secular uses than be left to become a sanctuary for the bats or a den for tramps or religious demagogues."

After Mr. Hubbard's report was concluded, a delegate rose and asked, timidly:

"May I tell what we did with our two old churches?"

"Certainly," answered the chairman.

"We sold them."

"For what uses?" inquired half a dozen at once.

"One was bought by the town for a school, the other by a physician for a sanitarium and boarding-house."

"How much did you get for them?" demanded some speculative disciple.

"Five thousand dollars for the two."

"What did you do with the money?" came in several voices.

"We invested it in a fund for the benefit of the Church?"

"How long ago was that?" It was Mr. Franklin who asked this question.

"Two years ago last spring."

"So you have had the benefit of this fund now two years. How do you thrive under it?" continued Mr. Franklin.

"At first, we thought ourselves very rich. But, when we came to figure up our income, we found that it had fallen off considerably. The year before, we had raised fifteen hundred dollars with no difficulty; the interest on our fund reduced the amount about three hundred dollars, but it was twice as hard to raise twelve hundred dollars that year as it had been to raise fifteen hundred the year before. A good share of our parishioners fell back upon that fund and shut up their purses with a snap, and would not give any-

thing. Last year it was still worse; we began to be afraid that we should not be able to raise a thousand dollars Finally we called a meeting and determined to get rid of that millstone. By a vote of two to one we turned the money over to the town to be used in endowing a free library, and then we sang the doxology."

Laughter and cheers greeted this illuminating speech.

"He that hath ears to hear, let him hear!" cries Dr. Upson. "A bank vault is a poor place for a church of Christ to lay up its treasure in. We will now hear from Ridgefield County. Brother Harlan, you have the floor."

It was evident that Brother Harlan was a character. A man in plain farmer's clothes, with keen gray eyes, glancing out from beneath beetling brows, a shock of refractory red hair, and a close-cropped beard of the same color, ambled to the front and began deliberately:

"I'm not the secretary of our county," he said; "Captain Thomas is sick, and he sent word to me day before yesterday that I must come here and report for him. I haven't a word written, and I shall not begin to tell all that ought to be told about the work in our county; but I'll give a few facts that have come under my own eye. I don't know much about the figures; but I know that quite a lot of sickly churches have been killed off. And that's the right way to serve 'em. We thin out a hill o' corn that has seven or eight stalks when there isn't room for more than three or four, and get a better crop for doin' it. When churches come up too thick around here on these hills, they've got to be thinned out in the same way. Poor husbandry, I calc'late, to keep diggin' round 'em, and manurin' 'em with home missionary money, when there's no more chance of gettin' a crop from 'em than there is from a patch o' corn that's sowed broadcast.

"In the town where I live, in Ridgefield County, we had three churches for more'n twenty years. Fifty years ago there wasn't but one, and the population was fifty per cent. larger then than it is now. Two years ago, the Congregationalists and the Methodists made up their minds to come together; they kept both meetin' houses, and the united society worships in one in the mornin' and in the other in the evenin', and that accommodates both ends of the street. We have a congregation a good deal larger than the two put together used to be, and we pay our minister, easy enough, a good, comfortable salary. The fact is, we've got a minister that it's easy enough to pay. He's a keen-witted, level-headed young man who understands himself and his business, and knows something outside of his business too. Everybody likes him. He talks to us very plain in church; it comes right from his heart, and it goes right to our hearts; and when he is around among the farmers he don't find it hard to make talk come. He knows his Bible and he knows other books; but he knows men, too, and cattle and sheep and horses,—especially horses. He's got one of the likeliest colts in town, and he keeps his coat as shiny as satin. The other day the parson was sittin' in his buggy in front of one of the stores talking with half-a-dozen men, when along came old Sime Harrison, who lives up at Scrabbletown. Sime's one of those terrible slovenly critters that keeps everything at loose ends around his farm, is always behindhand with his work, and never pays his debts; but, because he is so loose in everything else, he tries to even things up by being mortal strict in his religious notions. He generally drives his horses tandem; because he never gets ready to rig a whiffletree and a pole. It's a city fashion, I understand; but we farmers consider it a dreadfully shiftless way to hitch up horses. So Sime comes a drivin' up his two old nags afore his buckboard, and he stops when he gets opposite the parson, and leanin' over towards him in a kind o' confidential way, he says: 'Brother Hall, do you think the 'Postle Paul ever druv a fast hoss?' 'Don't know about that,' answers the parson, quicker 'n lightnin', 'but I'm pretty sure he never drove two horses tandem.' You'd ought to have heard them men shout. Sime didn't want to know any more about the 'Postle Paul, and he druv right on. But that's the sort o' man our minister is. Smart as a whip, I can tell you! He stands square on his feet, looks you right in the eye, and commands the respect of everybody. It's a great thing for the town, and especially for our boys who are growin' up, to have a man like that around among us,—a gentleman, a scholar, a man of sense and self-respect, a man who pays his debts, and has no need to beg of anybody or to be beholden to anybody for his livin'. It makes religion seem a sensible and respectable sort of thing.

"One Sunday evenin' last spring, we had a Sunday-school concert, and our pastor went down to the West village to preach to them, because they hadn't any minister. The next day I was down there, and everybody was talkin' about his sermon. 'Made it jest as plain as daylight,' they said. 'Can't help listenin' to him.' 'Understood every word he said.' 'Wish I could hear such preachin'

every Sunday,' says Deacon Chapin. 'Well, what's to hinder you hearin' it?' says I. 'What do you mean?' says he. 'I'll tell you what I mean,' says I. 'It's two mile and a half to the old church in the East village. When I was a boy I lived half a mile further west than you do, and our folks was always at the old church every Sunday, rain or shine, and so was quite a number of families livin' down this way. It isn't any further now'n it was then, and there's better roads.'

"'But there's a good many families in this neighborhood that haven't teams,' he said.

"'Well, then, git up one or two big teams and bring 'em.'

"'It'd cost too much.'

"'Would it? How much does it cost you a year to keep your church goin'?'

"'Well, about six hundred dollars is the least.'

"'And how many do you git to church?'

"'Forty or fifty, ginerally.'

"'Yes; and a good share of them has teams of their own. Now you can arrange for teams that wont cost you more'n five dollars a Sunday, that'll take at least thirty persons up to the old church. I'm an old stager, and I'd like to take the contract of transportin' thirty from the West village to the East village and back agin every Sunday for five dollars. The rest can go with their own teams. You wont want to get your preachin' for nothin' up there, of course; but you can pay for that and pay the expense of transportation, and then save money on what it costs you to keep up this church. Besides, you can have first-class preachin' every Sunday, instead of four hundred and forty-fourth class.'

"'But there will be many Sundays,' said the Deacon, 'that it will be stormy, or the roads would be bad and we couldn't go so far.'

"'There might be five or six Sundays every year,' I answered, 'when the roads would be bad. But how many Sundays in a year on the average, are you out of preachin' on account of a vacancy in your pulpit?'

"The Deacon looked over the church books and found that for the last five years the pulpit of the church in the West village had been without a supply fifty-five Sundays in all—just eleven Sundays a year on the average. He agreed with me right off that there would not be so many Sundays as that in the year when the roads between the two villages would be too heavy for travelin'. And the result of our talk was that a meetin' of the people in the West village was held, the matter was talked up, a subscription to pay for teams was started, and now we bring the West villagers to church and Sunday-school at the East village every Sunday, and git more of 'em than ever went to their own church. They keep up their own Sunday-school, too, in the afternoon, and their prayer meetin' in the evenin', but they like the present arrangement and wouldn't on any account go back to the old plan.

"In several other towns of our county the same thing, or something very much like it, has been done. We have seen the tribes that have been scattered abroad return with singin' unto Zion. As the prophet says, we ain't exactly *standin'* in the old ways, but we're walkin' in 'em or, rather, drivin' over 'em up to Jerusalem; and it seems good to have the people of the whole town come together with one accord in one place, just as they did on the day of Pentecost. We've had some Pentecosts of our own, too, in Ridgefield County, and I should like mightily to tell you all about 'em; but I've kept my eye on the clock, and know that my time's up."

Brother Harlan's shrewd harangue was received with much laughter and applause, and as soon as it was ended the questions began.

"How large is your congregation on Sunday mornings?"

"Last Sunday I counted three hundred and eighty-nine. It was not above the average."

"That is a large congregation," interposes Dr. Upson. "Few of those in the cities are so large."

"How many do you think would have been found, on a pleasant Sunday, in the three churches before the consolidation?"

"Not above three hundred."

"Is your church entirely self-supporting?"

"*Yes*, sir."

"Do your people contribute to any missionary or benevolent societies?"

"Last year we gave over three hundred dollars."

"How do you manage that?"

"We take a collection every month. Several of these collections are for Union societies. When we take up our collection for foreign missions or home missions, or the publication cause, we distribute envelopes in the pews, and each person puts his amount into an envelope, and writes on it the name of the society to which he wants it to go. If he is a Congregationalist, he sends his foreign missionary money to the American Board; if he is a Methodist, he sends it to the Methodist Board of Missions, and so on. The treasurer gathers up the amounts and forwards them to the right places, and reports to the church the amount of the collection and the sum remit-

ted to each of the societies. At our monthly missionary meeting, we hear from the missions of all the denominations, and know a great deal more about what is going on in the mission field than we used to know when we heard only from the societies of one denomination."

"How do your contributions in envelopes compare with those in cash?"

"They're twice as big. Partly because there's a little strife to see which society shall get the most, and partly because folks don't like to put a cent into an envelope."

Brother Harlan stepped down from the platform amid applause and a buzz of jocose comment. His report, informal and uncouth as it was, contained more meat than any that preceded it. The next to take the floor was Mr. Greene, the secretary from Bradford County.

In this county are several cities and large towns, and the report was expected to deal not only with the problem of consolidating the small churches, but also with the important question of evangelization and charity presented by the urban populations. Bradford County contains New Albion, and was the home of the Christian League. Concerning the beginnings of the Union movement in some of the towns of this county the readers of this history are fully informed.

In three of these towns Mr. Greene's report showed that serious difficulties had been encountered. In Scantico, a few strenuous Methodists, egged on, as some said, by the presiding elder of the district, determined, after the Union church had been in successful operation for about a year, to reëstablish sectarian worship. Accordingly they demanded, in the name of the Methodist Conference, the meeting-house which had formerly belonged to them and which had been occupied for evening services by the united church. They asked for a minister, and a Methodist clergyman, partly disabled by ill-health, who was sojourning for the year in Bradford, was sent over to supply their pulpit. Unfortunately for their purposes, this clergyman was a man of broad views and generous temper, and he soon discovered the state of the public mind in Scantico. He called upon the pastor of the united church and proposed Union services in the Methodist church in the evening, and in the other church in the morning, so that things went on for a few weeks much as before, the only difference being that there were two ministers instead of one. This was not exactly what his supporters had bargained for, but he was a man of so much intelligence and strength of character that they did not like to quarrel with him; and besides, it was somewhat ungracious to object to Union meetings. At length he told the united congregation, one Sunday evening, that his work among them was finished, and that he should return the next day to Bradford; that Scantico needed but one church and that one minister was better than two; that his brother Thomas, of the Union church, was a good enough Methodist for him; that he should file with the presiding elder his protest against the reestablishment of Methodist worship in Scantico, and, if it became necessary, should carry the matter before the Conference at its next session; that the Methodist Church should not be made, if he could help it, an instrument for creating or perpetuating destructive schisms in the Church of Christ. This bold movement completely discomfited the Methodist sectarians, and they abandoned their scheme without a struggle.

In Tuckerton it was a Congregational clique that made the trouble. In that town there had been two Congregational churches, the division arising out of a feud about the choir, and continuing for many years, until the Union church was formed. The Second Congregational church stood in a small settlement dubbed by the Central villagers Potluck, in revenge for which the Potluckians persisted in applying to Tuckerton proper the contemptuous sobriquet of Kittleville. Much local warfare, of a nature not very sanguinary, had been waged between these two precincts from time immemorial, and it was considered a sure sign of the millennium when they agreed to come together and form a Union church. But this millennium did not last a thousand years, probably because the devil was not chained. He made his appearance in Potluck in the form of a Congregational minister of dubious credentials, who proposed to hold services in the church in that place, and by his unction and plausible speech contrived to deceive even the elect. To the ultra orthodox he suggested the danger of allowing their children to be trained up without any knowledge of the "doctrines of the fathers"; to those in whose breasts local pride burned most fiercely, he urged the ignominy of allowing Potluck to become "a mere suburb of Kittleville." Plying both these arguments industriously, he soon had quite a following at his heels, and almost before any one knew of it services were in full blast again in the Second Congregational church. But a letter was written to some of the leading Congregationalists in Bradford and New Albion, and a strong delegation from the League clubs of those cities went down to Potluck, called together the leading Congregationalists of that precinct, assured them

that they would fail of obtaining the Home Missionary aid on which they had depended for the support of their separate service, showed them the folly of the course into which they had been led, gave them some bits of the history of the man who had wormed himself into their confidence, and succeeded in bringing back Potluck from its wanderings, and in repairing once more the breach in the walls of the Tuckerton Zion.

In several other towns where Union movements had been set on foot there had been outbreaks of a sectarian nature, some of which had not yet been subdued. The spirit of sect, like the Judaizing temper among the early Christians, was continually showing itself: men who had been bred in an intense sectarianism, who had been taught from their cradles to put the interests of sect above the interests of Christianity, could not all at once quench their unholy zeal and stop seeking, *first*, the kingdom of Methodism, or of Episcopacy, or of Congregationalism, and *its* righteousness; nevertheless, the broader sentiment and wiser methods of a genuine Christianity were all the while gaining strength, and the partisans of a narrow ecclesiasticism knew that they were fighting a losing battle. In quelling these sectarian outbreaks the County League had been of the greatest service. Whenever any attempt had been made to form a new church or revive an old one in a town where the churches had been consolidated, the Outlook Committee, consisting of a representative of each of the denominations, had proceeded immediately to the spot, and had made a full examination of the circumstances, publishing the facts in the principal newspapers and making full report of them at the next meeting of the League. These temperate but truthful representations generally brought a considerable pressure of public opinion to bear at once upon the offending schismatics; if that did not suffice, a committee, composed wholly of members of the sect to which they belonged, appointed by the County League at its next meeting to remonstrate with them and bring them to a better mind, sometimes had the desired effect. At all events this County League, formed in the interests of Christian coöperation, concentrating and expressing all the most Christian sentiment of the county, keeping the eyes of its Outlook Committee on all the places where admonition or encouragement was needed, and swift to drag into the light of day all the hidden things of darkness that the spirit of sect lay in wait to do, was a mighty help in promoting the unity of believers and in preventing the reactions that were in danger of occurring here and there.

Mr. Greene's report, thus summarized, was given extemporaneously, and like many another layman he used up his time before finishing what he had to say. In the midst of his speech he was interrupted by the Chairman:

"Time's up, Brother Greene. I know what you have left unsaid, and how important it is that you have a chance to say it. Perhaps it may be brought out in the conversation. Let me suggest to the convention that questions be asked about Christian League work in Bradford."

"That is just what I want to hear," spoke up Mr. Strong. "I know something about it, but I want to know more definitely. Will Mr. Greene tell us something of the charitable work of Bradford?"

"Thank you!" was the answer of the secretary. "I should have greatly failed of my duty if I had not brought something before the convention respecting this work. Our Charity Organization is an enterprise of the greatest importance, and it is the child of the Christian League Club of Bradford."

"What is the Christian League Club of Bradford?" asked Mr. Strong.

"It consists of the minister and one layman from each of the Protestant churches in the city. The organization is similar to that in New Albion, except that we have fewer laymen. With three laymen from each church our club would be unwieldy."

"Go on with your story."

"When the club first faced the problem of poverty and pauperism it found five charitable societies at work in the city, rivals and competitors, all striving to see which could "relieve" the largest number of paupers, and collect and disburse the most money. Of course they disbursed a deal of money, and of course pauperism was rapidly increasing. To secure coöperation among them seemed a hopeless task. At length the club determined to solve the difficulty by organizing another society which should be pledged to give no material aid whatever, but to work wholly by moral and industrial methods. A system of registration was adopted, by which the names of all persons receiving charity were recorded, with such information as could be gathered concerning each of them. The other societies and their churches were all invited to send to this bureau the names of all the persons relieved by them; and although this was at first refused by some of them, the measure was so evidently necessary, for the exposure of imposture, that they were obliged to adopt it. Immediately we were able to notify the societies and the churches of many cases in which the same persons were receiv-

ing aid from two or more of them at the same time; and they soon found out the value of the bureau of registration. Then we divided the whole city into small districts, and after much labor succeeded in securing a competent visitor for each of these districts — one hundred and forty-seven in all. The charitable societies and the churches had had but few visitors — not a score of them in all the city. With all the money disbursed yearly, very little personal care and help had been bestowed on the poor, and this was the defect we sought to supply. We published a map of the city, with the districts numbered and the name of the visitor for each district, and offered the services of our visitors to the charitable societies and the churches for the investigation and care of the cases which they were called upon to relieve. Some intelligence and conscience in the administration of charity had begun to be developed, and the dispensers of charity readily availed themselves of our offer. Our visitors soon had their hands and hearts full. They were forbidden to give money or food or coal in any case, and were enjoined never to recommend the granting of such relief by the other societies, except in cases of sickness and absolute disability. Their problem was to help the poor without giving them money or subsistence; to help them by finding work for them, by rousing them to help themselves, by directing them into more frugal and comfortable habits of living, and by befriending them in every possible way. Our visitors were taught that this work of moral aid was in the deepest sense of the word a missionary work; that it could not be rightly done unless it was inspired by a "genuine enthusiasm of humanity"; that it needed for its accomplishment a Christly sympathy and tenderness and tact, and a Christly courage and patience. Once in two weeks we have a meeting of all our visitors,—a conference meeting, in which each one has the privilege of giving his or her experience (they are mostly women), and of asking counsel about any hard cases. I tell you, brethren, these are the most interesting meetings I ever attended in my life. It would stir your hearts to listen to the stories told, and to see with what dauntless courage and what untiring patience and what marvelous tact and tenderness these good women are working for the salvation of the forlorn, discouraged, helpless creatures that are placed in their care. Our system does not allow a single visitor to have the care of more than two families at once; we do not believe that one visitor can, as a rule, do justice to more than two families; we want them to give to each family a great deal of time and care and personal attention; and the results of this patient, loving, hand-to-hand work among the poor of our city are full of encouragement."

"Don't you find some cases that are past saving?" some one inquired.

"We never admit it," was the answer. "There are cases in which, so far as we can see, no permanent improvement is made; but, if men ought always to pray and not to 'faint,' then they ought always to work for those for whom they pray, and not to faint in their endeavors any more than in their prayers. I always remember what Robert Falconer said to his father, the wretched old drunkard, 'Father, you've *got* to reform some time, and you may as well begin now.' That is the substance of what he said. If we had a little more of that sort of purpose, we should save more of the hard cases."

"How many families have you cared for during the last year?"

"More than three hundred."

"What has been the effect upon the disbursements of the charitable societies?"

"They have been reduced about fifty per cent., and everybody admits that there is less suffering now than there was when the larger sum was distributed."

"What is the effect upon the morals of the city?"

"The sentences for drunkenness and petty crime were fewer by fifteen per cent. last year than during the previous year."

"Do you attribute all this to the improved methods of charity?"

"No. That would not be fair. Other important agencies have contributed to this result. To the establishment of friendly inns quite as much is due."

"Tell us about them," came in half-a-dozen voices.

"My time is up."

"Mr. Greene may have ten minutes of my time," said the secretary from Rockbridge County. "My report will be largely a repetition of what we have heard already. This is more important."

The generous proposition was hailed with applause by the convention. Mr. Greene went on:

"Our club found, in fighting the saloons, that it was good tactics to borrow some of their weapons. We were confronted by exactly the same state of things as that which was discovered at New Albion, only our city is much larger than New Albion, and therefore the perils were greater and the needs more urgent. A large part of our population is without homes. The clerks, the operators in our manufacturing establishments, and the mechanics are largely home-

less. Such lodgings as most of them can afford are cold in winter and cheerless in all seasons; it is for warmth, shelter, and companionship, more than for drink, that many of them resort to the saloons. Some of them will go to the reading-rooms, but many, and those who are in greatest peril, have no taste for reading. The problem was to provide safe places of resort for this class of persons. We thought of a Young Men's Club, like that at New Albion; but it seemed advisable, as our territory is so large, to have several places of this character, in different parts of the city. Accordingly the plan of establishing friendly inns, or coffee-houses, in suitable localities, was suggested, and a company was incorporated, with a capital of ten thousand dollars, to prosecute this enterprise. It was not designed to be a charity; it was intended that the business should pay expenses from the start. The money was invested in lease and fixtures. Four suites of rooms, in different quarters of the city, were procured and fitted with counters, tables, crockery, cooking-ranges and furniture, and comfortable chairs; the intention was that they should be used for lunch-rooms during the middle of the day, and for places of resort in the evening. Many merchants and professional men and some mechanics, it was thought, would take their midday lunch in these clean and comfortable places. The tables were to be partly removed in the evening, to give room for free movement and sociability. In each of the rooms an open fire was to be kept in the winter, and a fountain surrounded with flowers to cool and sweeten the air in the summer. Coffee, tea, chocolate and milk were to be always on sale, with plenty of the nicest bakery rolls, biscuits, and the like; and in the summer, lemonade and soda-water with sirups of the best quality, at reasonable prices. A cup of coffee with rolls was to cost but five cents; a glass of milk but three cents. Newspapers were to be furnished, and various games, such as checkers, chess and backgammon, were to be provided. It was thought best to make a small charge for the use of the games, five cents for each person; and to avoid, so far as possible, every semblance of gambling practices, persons taking the games were required to pay for them in advance. In the rear of the larger room, thus devoted to social purposes, was a smoking-room, well ventilated, with cozy chairs, where smokers could take their fill of their peculiar pleasure, without encroaching upon the enjoyment of those to whom smoke is not delectable.

"After some such general plan as this, our coffee-rooms were all fitted up, the treasurer of the company giving much time and care to their arrangement. It is not too much to say that there are no saloons in Bradford half so pretty as they are. And it was believed that rooms so furnished could be rented to men who would pay the rent and a fair rate of interest on the capital invested. The problem was, of course, to find the right men; but there was no lack of applicants for the places, and the selections seem to have been wisely made. The inns have all paid expenses, and the stockholders have received a four per cent. dividend at the end of the first year. This success is due, largely, to the energy and business tact of the treasurer, Mr. Marble, who has taken this for his diversion, and has found unbounded satisfaction in the working out of his plans. The belief that the opening of cozy, free-and-easy places of refreshment and social resort would draw many young men away from the liquor saloons, has been abundantly justified by our experience."

"Why do you charge for the games?" asked some one.

"For revenue only," answered Mr. Greene. "We thought that habitués would be willing to pay a small price for their use, and that they might feel a little more comfortable about using them if they paid for them. There has been no complaint about the charge, and the amount received from this source nearly pays the rent of the building."

"Does your company keep any control of the rooms?"

"No, each friendly inn is under the control of its own landlord. We make a definite contract with him, as to the kinds of refreshment he is to provide and the prices he is to charge, and the general regulations of the rooms; and, of course, we visit the inns frequently to see that they are properly kept and that the food and drink are of the best quality."

"Do you think that this has had any marked effect in reducing the amount of drunkenness?"

"I have no doubt that the great reduction shown by our police reports in the amount of drunkenness during the past year is largely due to the friendly inns."

As Mr. Greene was stepping down from the platform, amid the applause of the convention, Mr. Strong interrupted him:

"You have two minutes more. Are there not some other features of your charitable work in Bradford of which you ought to tell us.

"I should be glad," answered the Bradford secretary, laughing, "to take twenty minutes more and tell you about our Employment Agency, our Industrial School, our Kindergartens, and our Day Nursery, all of which

have sprung up in connection with our Charity Organization society, and all of which are important departments of its work. But I have talked too long already; if any one wants to know more about these forms of our Christian League work, I will show them to you this afternoon. They will speak best for themselves."

For the reports of the other county secretaries, there is no room in these chronicles. In many of their features they were similar to those already presented. They filled the morning session, and the interest had not flagged when the hour for adjournment came.

The afternoon session, according to the announcement, was devoted to the reading of two carefully prepared papers: the one by the Reverend Doctor Smalls, of New Liverpool, on "The True Definition of the Church," in which he defended the proposition that the Church consists of all the faithful people residing in any given community—that there is but one church in any city or town, though there may be many congregations, worshiping in different places by different forms, and that the different congregations ought to recognize themselves as one church and behave themselves accordingly. The other paper, read by Thomas Marshall, Esq., of Northbridge, on "Temperance and Tenement Houses," proved to be a most luminous exposition of the effects of unsanitary dwellings upon the drinking habits of the people, together with accounts of some of the recent experiments made by capitalists in the erection of improved tenement houses, well lighted, ventilated, and drained, and of the obvious effects upon the morals of their occupants. But as these papers were printed in full in the Bradford "Courier" of the next day, and must still be easily procurable, there is no need to reproduce them here.

For the same reason it is unnecessary to report the two short speeches of the evening session. One matter, however, of deepest interest, must not be passed by. After the second speaker had taken his seat, Dr. Upson rose:

"I am sorry," he began, "to announce to this convention the only failure on our programme. Dr. Jackson, of Winchester, who was to make the closing speech, sends us a dispatch, which was received since the afternoon session, informing us that a railway accident on the Western road will prevent him from keeping his engagement. You will regret that as much as I do. But there are always compensations for our losses, if we know where to look for them; and I think that I am on the track of one. The secretary of our Executive Committee, Mr. Walter Franklin—(applause)—has been receiving a good many letters from distant places, making inquiries about the working of the League, and giving information of movements that have been set on foot in other States with the view of carrying out its principles. I am sure that he could give us, if he would, some interesting and cheering reports. I have besought him to do so, but he has not consented; I am going now to pass him over to you, and let you deal with him as seems good to you."

The convention expressed its will in such a way that Mr. Franklin could not easily resist. He ascended the platform amid a storm of cheers.

"Perhaps I ought to beg your pardon," he said, "for hesitating to bring you such tidings as I have; my only reason is my strong aversion to the sound of my own voice in a public place. But there are, as Dr. Upson has told you, quite a number of letters and newspaper clippings in my portfolio, showing the wide interest taken in our work, of which I will try to tell you something.

"The most amusing letters I receive are from persons who profess to be greatly interested in the history of our league, and who think the plan a beautiful one, but who fear that it is not practicable. There is no conservative so entertaining as your conservative who disputes an accomplished fact. You know that Dr. Dionysius Lardner proved, scientifically, that no vessel could be moved across the ocean by steam-power after the thing had been done. You know that an eminent electrician demolished the project of submarine telegraphy after messages had crossed the sea. And in like manner the measure of coöperation in Christian work proposed in the organization of the Christian League is demonstrated to be impracticable by a theorist here and there, long after the thing has been successfully worked out in many places. I will not trouble you with reading any of these letters; I have stuck them on pins to be preserved in my museum; about fifty years from now they will be highly interesting reading.

"Very amusing, also, are the letters from mystified correspondents, who wish to know whether there is a veritable Christian League in Connecticut. If they could only look into this crowded room and hear the noise you make, they would probably be convinced that the League is not a myth.

"The reports that come to us from all parts of the country show that the ideas of our league are taking hold of the people, especially of the laity, everywhere. I cannot begin to give you any adequate notion of the extent of their working. Take this little item which I have clipped from the last number of one

of our religious newspapers, describing the payment of the debt of a Congregational church in a Western city:

"'The pleasantest feature of the occasion was the remarkably hearty and substantial expressions of interest on the part of the other denominations. They closed their churches Sabbath evening, and some of them in the morning also; and the several pastors were to be seen moving among the congregation, soliciting subscriptions from their own people. Monday evening, when it seemed as if the ability of the audience had been exhausted, and there remained several hundred dollars of the debt yet to be raised, the *Methodist* pastor came to the rescue. By a wise plan, which he pressed with great skill, he raised the entire amount amid great hand-clapping, and declared that, next to the pastor, he was the happiest man in the house.'

"That sounds like an echo from New Albion, does it not? But it is not necessary for me to dwell upon facts that fall under your eyes in all the papers. Let me speak of a matter more remote, but not less notable.

"It is well known to many of you that the sectarianism which we are organized to fight is making its worst ravages on our Western frontiers. The strife of the sects for the occupancy of every new settlement is the scandal of Christianity. Every man knows this who has traveled in the West and found in the small towns, on an average, one church for every hundred inhabitants. From this afflicted region I have had letters not a few, rejoicing that this movement had begun at the East, and praying for the time when its tidal wave should begin to roll across their prairies and up their cañons. From a shrewd observer, who knows that Western field thoroughly, and who is in the deepest sympathy with the Home Missionary work, comes a letter from which I will read you a few sentences:

"'The real trouble now is with the intermediate agents of our churches. I mean the presiding elders, the synodical missionaries, and the district superintendents of missionary work. So long as our societies will appoint to such places men whose only qualification is business push—men of about the calibre of a good book-agent, men who could push a cyclopedia in a State—so long there will be confusion enough. I could tell of some in this great work that are perfectly unscrupulous. Our societies must be made to see that they *must* get men who will look at the work broadly, and build with eternity, not quarterly reports, in view. The policy of each missionary society should be expressed, not implied; and agents should be held to account for pushing in where not needed.'

"This extract shows that the responsibility for the state of things existing at the West belongs largely at the East. The power behind this pushing propagandism has its headquarters in Boston and New York. If you want to get at it, you can easily reach it. But let me give you another bit of the same letter. Speaking of the results of this sectarian scramble at the West, the writer says:

"'I am quite sure it is very seriously affecting the character of our ministry. Who but a mean-spirited man will consent to be one of five in a town of five hundred people? Then, is it not near to the sin against the Holy Ghost thus to misuse the gifts of the Spirit? What wonder ministers are scarce, when they are employed in this way, four or five crowded into a place where there is need of but one, and set in antagonism and rivalry, with no chance to develop any spiritual power? And all the while the world is full of heathenism! Really, this is the most serious phase of the question. A gift of the Spirit, a man furnished by the Spirit for the ministry, is a gift infinitely more precious than the money to feed him, and the misuse of such an one or the misapplication of the gift comes nearer to malfeasance than any misuse of funds.'

"This man writes out of his heart, you see. And he writes not unadvisedly. No man in the West is better qualified to judge. And I beg you to note what he says respecting the effect of sectarianism on the character of ministers. I confess that this was to me a flash of revelation. But who can question the truth of it? What kind of a Christian is the man likely to become, whose character is developed in these denominational bear-fights? What kind of a Christian is the man who is ready to rush into them? I tell you, high-minded young men will not do it. And many a young man, who would gladly give his life to pioneer work on the frontiers, turns back when he sees into what sort of scrimmage he is pretty sure to be driven.

"But I am only showing you the evils of this denominational strife. Of these you hardly needed to be told, though my correspondent may have thrown new light on their deformity. What I began to tell you was the good news that the Christian League has been heard of on the frontiers, and that its good seed is beginning to find lodgment in a soil where it ought to bring forth a hundred fold. We have heard some cheerful tidings here to-day, but none to me so significant as this which I read you from the representative of one of our Home Mission boards in the far West. He tells of a conference, lasting all day, between the Home Missionary representatives of four leading denominations, four men who have the oversight of two or three Territories. He says that they came to this conference with the Christian League in their minds, and this is his report of what came of it:

"'We did not organize; had no chairman or secretary, and passed no votes, but simply looked one another in the face, and tried to look the facts of the field in the face. We took up the case of each place—went from ——, on the ——, to ——, covering the whole

field. We did not realize my *highest* ideal of such a meeting, which would be the consulting entirely as though we were of one denomination; but I believe it was a long step in the right direction. We have arranged not to go into a town where another denomination is at work, when there is any chance for misunderstanding, without consulting with the representatives of the church in that town, or with the superintendent of mission work. We have promised one another not to take advantage of temporary bad luck in getting ministers. We have arranged to exchange fields and properties, as far as possible, when it becomes evident that the best interests of the cause demand it. I have, for instance, given up our church at —— to the ——ists, as the people are nearly all of that faith and ask for a ——ist minister. The ——ists have given up a field to me. The ——ans promise not to enter a field where we have a church, though pressed by some to do so. We have arranged for another meeting in six months.'

"Now, I say that's the best report we have had to-day. It makes me feel more like shouting hallelujah! than anything I've heard for many a day. And if this were *my* meeting-house, and were not the meeting-house of a very staid and undemonstrative body of disciples (laughter) I should call for three cheers for those grand fellows out West who have got the denominational devil fairly under, and who have set out to treat one another, in their mission work, like Christian gentlemen!"

As Mr. Franklin went down from the platform amid a tempest of hand-clapping, the organ and the choir burst forth with the doxology, in which the congregation joined, and the convention went out in a blaze of enthusiasm.

Mr. Strong and his English friend walked quietly away to their lodgings. The first to speak, when they are out of the hubbub, was Mr. Thornton:

"Doesn't your friend need a vacation?"

"Franklin?"

"The same."

"He does indeed. I have been urging him to go abroad."

"He must go. He shall go. I want him to help me organize a Christian League Club in Manchester. That is the place to begin."

"Do you think it would work on your side the water?"

"Why shouldn't it? It might need some modifications. But it undertakes nothing more than the Christianizing of our churches."

"And nothing less," you might add.

"And nothing less! It is a great thing to undertake, but he would be a faithless Christian who should doubt whether it could come to pass."

MARSYAS.

ROUND one piping on the mountain
Timid forest-creatures drew;
Song of bird and purl of fountain
Woke anew
In the oaten pipe wherein he blew.

Ivy sprung, and myrtle nodded,
Grasses rippled, sedges grew;
Silver-winged and tawny-bodied
Wild bees flew
Thickets over, meadows through and through.

With the swift sweep of the swallow,
Spring-time seemed to catch the earth,
Sunlight flooded steep and hollow
With new birth,
Woke the hill-side to the river's mirth.

Quiet things he loved the best:
Songs of springs that bubble up
Through wet grasses, weight-oppressed;
Bees that sup,
Droning in the almond-blossom's cup;

Beat of wings that swiftly pass,
Sounds of locust-horns that made
Subtle music in the grass.
These he played,
While shy things came to him, unafraid.

Ceased he. Silent grew the fountain;
Fled each creature to its lair;
Solemn wood and silent mountain,
Soundless air,
Woke to find the winter everywhere.

L. Frank Tooker.

SONGS.

"AFTER SORROW'S NIGHT."

AFTER sorrow's night
Dawned the morning bright;
In dewy woods I heard
A golden-throated bird,
And "Love, love, love," it sang,
And "Love, love, love."

Evening shadows fell
In our happy dell;
From glimmering woods I heard
A golden-throated bird,
And "Love, love, love," it sang,
And "Love, love, love."

Oh, the summer night
Starry was and bright;
In the dark woods I heard
A golden-throated bird,
And "Love, love, love," it sang,
And "Love, love, love."

"THE WOODS THAT BRING THE SUNSET NEAR."

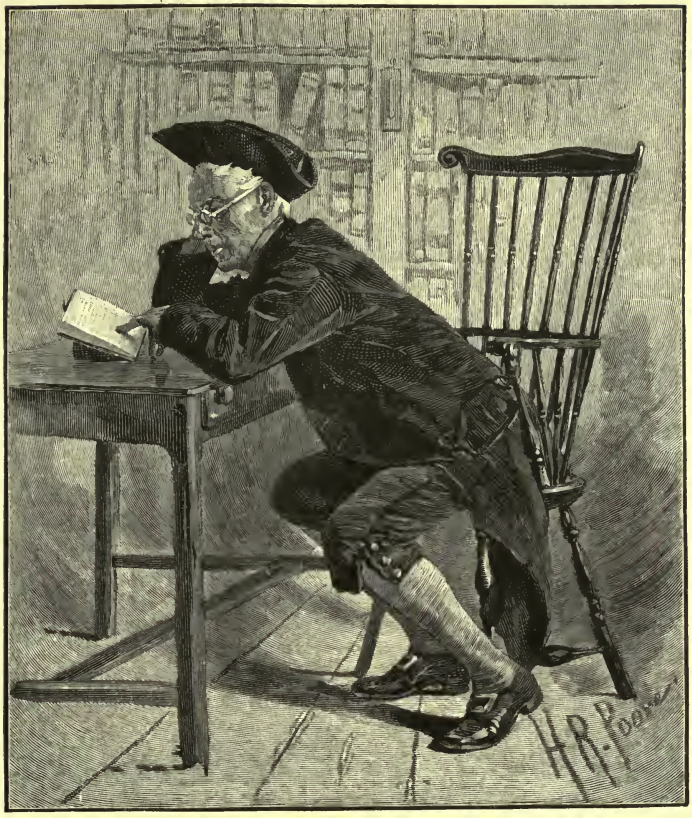
THE wind from out the West is blowing,
The homeward-wandering cows are lowing;
Dark grow the pine-woods, dark and drear,—
The woods that bring the sunset near.

When o'er wide seas the sun declines,
Far off its fading glory shines;
Far off, sublime, and full of fear,—
The pine-woods bring the sunset near.

This house that looks to east, to west,
This, dear one, is our home, our rest;
Yonder the stormy sea, and here
The woods that bring the sunset near.

Richard Watson Gilder.

THE FATHER OF AMERICAN LIBRARIES.



A BOOK-WORM.

It was in the year 1731, the fourth of King George the Second's reign, that the Philadelphia, the oldest American library, and, so far as is known, the first of all lending libraries, took its beginning. Fifty young men, artisans and gentlemen of that town, joined themselves into a literary association, and subscribed a hundred pounds for the purchase of books, agreeing also to pay each ten shillings annually during fifty years for the same purpose. It has lasted through changes of government and fashion, and possesses an interest beyond its mere local importance, from the historic associations which gather around it. Polished granite and enameled brick might tower around, but its dark old red brick front maintained an unshaken dignity as did Franklin's statue—"with a gown for his dress, and a Roman head," as the Doctor, when asked his wishes, quaintly expressed them. Banks might chink their money; courts, post-office, and custom-house disgorge their bustling crowds next door,—but as you passed through its vestibule, embellished with old leathern fire-buckets, and the door swung noiselessly behind you, all became quiet. You might have been miles from the life outside, for any information coming through your ears. A repose fell on you insensibly. Old pictures looked down on you, and soberly bound books. The wired cases, and the old green tables in the alcoves, seemed to have been there always. Its habitués all knew one another, as well as all about one another's great-great-grandfathers. They laughed decorously over old jokes;—a new joke would have seemed hardly in order. Everything breathed quiet and long-continued good understanding. The epithet "old" came naturally to one's lips. "That good old library," Thackeray calls it, writing to Mr. William B. Reed.

The little fiction of the English law, that the king can never die, might almost be applied in the same sense to many members

BENJAMIN FRANKLIN'S CLOCK IN THE PHILADELPHIA LIBRARY.

of the library whose shares, like the English throne, have never been vacant, one of the family always inheriting it. Out of a bead-roll as long as that of Homer's ships a few instances may be given of this curious persistency of shares in families. Colonel William Bradford became a shareholder in 1769. His son, William Bradford, Attorney-General of the United States under Washington, next held the share, which is still in the family. Dr. Thomas Cadwalader, lieutenant-governor of the province, and father of the two Revolutionary officers, General John and Colonel Lambert Cadwalader, was one of the original directors in 1731, and his descendants are still shareholders. Governor Thomas McKean, one of the signers of the Declaration, acquired in 1777 a share, which his family still holds.

In fact, it might have been thought that as it had existed, so it would always exist. With its ease, its long existence, and connection with men whose names belong to the history of their age, it had become a sort of conservative social influence. It was unagitated by questions of cataloguing, undisturbed by debates whether a library should be merely a reservoir, or should also assume the function of a filter. In brief, its periods of existence were unmarked by any of those interrogations with which, nowadays, we see fit to punctuate every experience of life. Nevertheless, the Library Company underwent, as shall presently be told, an entire change of scene. The old building has been abandoned to the Philistines and now flaunts a large gilded sign — a sign of the times — on its astonished front. And a void exists in the breasts of many ancient Philadelphians, unsatisfied by the knowledge that the cultured Bostonian or the scornful New Yorker, as he emerges from the railroad station on Broad street, is confronted by the finest building wholly devoted to library uses in America, and one which has few, if any, equals in Europe.

The library was well sponsored, being Frank-

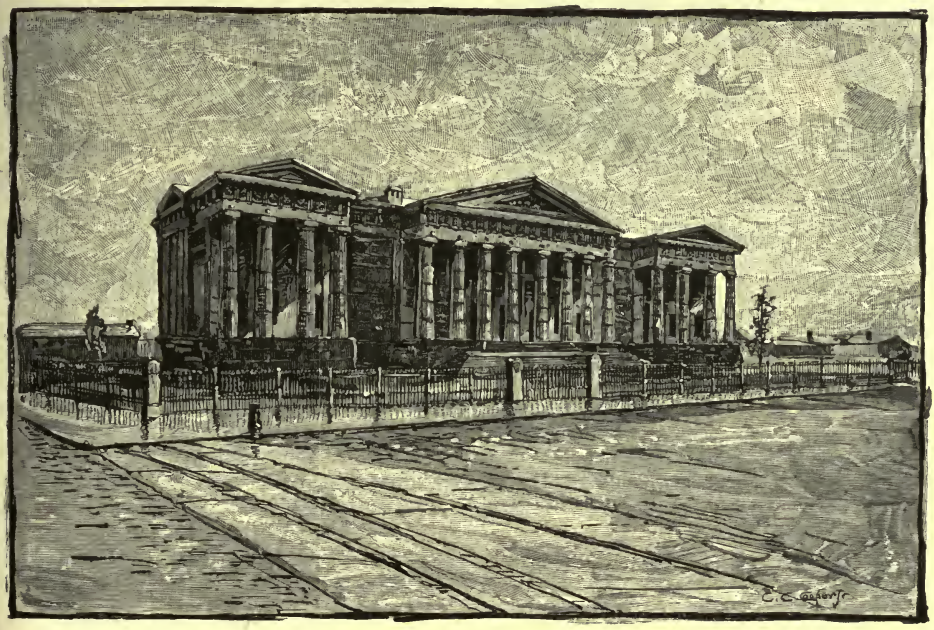
lin's "first project of a public nature." John Dickinson, Godfrey the mathematician, Benjamin Rush, Charles Thomson, Secretary of Congress, and Franklin himself,—who was also at one time librarian,—were among its



THE RIDGWAY BRANCH OF THE PHILADELPHIA LIBRARY.

early directors, and it was cradled in buildings whose names now form part of our fund of national recollections. Franklin says:

"At the time I established myself in Philadelphia there was not a good bookstore in any of the colonies southward of Boston. In New York and Philadelphia, the printers were indeed stationers; they sold only paper, etc., almanacs, ballads, and a few common school-books. Those who loved reading were obliged to send for their books from England; the members of the Junto (his club) had each a few. We had hired a room to hold our club in. I proposed that we should each of us bring our books to that room, where they would not only be ready to consult in our conferences, but become a common benefit, each of us being at liberty to borrow such as he wished to read at home. * * * This was accordingly done, and for some time contented us. * * * Yet some inconveniences occurring, each took his books home again. And now I set on foot my first project of a public nature, that for a subscription library. The institution soon manifested its ability, was imitated in other towns and in other provinces. * * * Reading became fashionable, and our people having no amusements to divert their attention from study, became better acquainted with books, and in a few years were observed by strangers to be better instructed and more intelligent than people of the same rank in other countries."

That the leaven did indeed work as Franklin said we may infer from the fact that in a few years Philadelphia took a decided lead in the art of printing, in amount as well as execution, and that it had a larger number of newspapers. From direct testimony, including that of the Rev. Jacob Duche, who, though of foreign extraction, became himself a director of the Library, and afterward made himself notorious by an attempt to persuade Washington to forsake the American cause, we would infer that the character of the society was decidedly literary. He writes, in 1774:

"There is less distinction among the citizens of Philadelphia than among those of any other city in the world. * * * Literary accomplishments here meet with deserved applause. But such is the taste for books, that almost every man is a reader."

The Company, in its first choice of reading matter, took the advice of James Logan, the confidential friend of Penn, "esteeming him to be a gentleman of universal learning and the best judge of books in these parts." It is noticeable that, in their list of about fifty authors, the only ones which may be said to belong to light literature are the "Guardian," "Tatler," "Spectator," and Addison's works. The books were imported from England, and with them came the first gift to the Library. Peter Collinson, a London mercer, wrote:

"Gentlemen, I am a stranger to most of you, but not to your laudable intention to erect a public library.

RELICS OF THE OLD LIBRARY.

I beg your acceptance of my mite, 'Sir Isaac Newton's Philosophy' and 'Philip Miller's Gardener's Dictionary.' It will be an instance of your candour to accept the intention and good-will of the giver and not regard the meanness of the gift."

The books were at first kept in the house of Robert Grace, whom Franklin characterizes as "a young gentleman of some fortune, generous, lively, and witty, a lover of punning and of his friends." Afterward they were allotted a room in the State-House; and, in 1742, a charter was obtained from the Proprietaries. In 1790, having in the interval absorbed several other associations and sustained a removal to Carpenter's Hall, where its apartment had been used as a hospital for wounded American soldiers, the Library was at last housed in a building especially erected for it at Fifth and Chestnut streets, where it remained until within the last few years.

It brought only about eight thousand volumes into its new quarters, for it had languished somewhat during the Revolution and the war of words which attended our political birth. But it had received no injury. Two meetings had been called to consider measures of removal to a safe place, but whether its members were engaged in taking care of their country or of themselves, they did not attend the meetings, and the red-coats marching in on the little visit they paid us after Germantown, found the books, and read them, too. But the red-coats behaved, in this instance, at least, peaceably, paying loyally for their use and not damaging nor confiscating nor carrying away a single volume.

Many relics of the Revolutionary time are stored in the Library, among them a colossal bust of Minerva, which stood behind the chair of the Speaker of the first Congress that met in Philadelphia. The writer of this paper is at Logan's library-table, sitting in a chair used by Washington, while Dickinson's writing-desk holds some books on the right, West's portrait of Franklin looks from overhead, and a lock of Washington's hair hangs near his left hand. Penn's and Cromwell's clocks, too, keep remembrance of other times, and go on ticking, as if reckless of a balance. Besides memories, however, the library gathered little during those sad days of the Revolution. But when the scene changed, and the weeping women who tended the wounded in churches and on door-steps after the defeat at Germantown were replaced by the triumphing cavalry who rode through the shouting streets to the State-House to lay at the feet of Congress the captured standards of Cornwallis, our Company felt the reaction, and in a little while sent an order to London for books—its first importation in nine years.

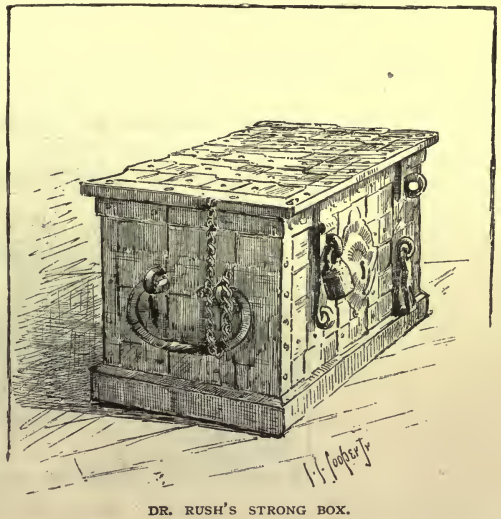
Two years after removal to its quarters on Fifth street, the Library received the most valuable gift of books it has as yet had. James Logan, friend and adviser of Penn and of the celebrated Colonial Governor, Thomas Lloyd, President of Council, and holding other high trusts in the Province,

JOHN DICKINSON'S DESK.

THE PRESENT BUILDING.

had gathered a most important collection of books. Mr. Logan was translator of Cicero's "Cato Major," the first classic published in America, beside being versed in natural science. His library comprised, as he tells us, "over one hundred volumes of authors, all in Greek, with mostly their versions; all the Roman classics without exception; all the Greek mathematicians. * * * Besides there are many of the most valuable Latin authors, and a great number of modern mathematicians." These, at first bequeathed as a public library to the city, became a branch of the Philadelphia Library under certain conditions, one of which was that, barring contingencies, one of the donor's descendants should always hold the office of trustee. And to-day his direct descendant fills the position, and is perhaps the only example in this country of an hereditary office-holder.

The Library lost a few books by its one experience of fire, in 1831, and nearer our own times gained an important addition by a courtesy it was enabled to do the British Government. The story takes us back to the Revolution of 1688. On the flight of James II. from his throne, his lord high chancellor of Ireland converted the state papers of which he had custody into family papers; in other words, he kept them. His grandson, on leaving America about the beginning of this century, presented them to the Library of Philadelphia. This gift, containing the private correspondence of James I. with the Privy



DR. RUSH'S STRONG BOX.

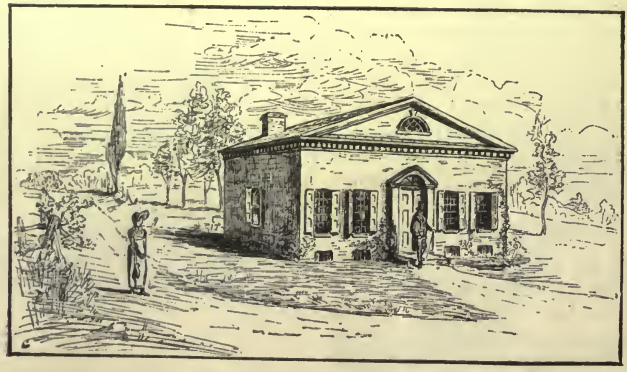
Council of Ireland, the Diary of the Marquis of Clanricarde, a letter of Queen Elizabeth, and other manuscripts, the Company—being bound by no reservation to its giver—took an opportunity of restoring to the British Government. This courtesy was responded to by the gift, on the part of the English, of a large and valuable series of Government publications.

In 1869 died Dr. James Rush, son of Benjamin Rush, and himself well known as the author of a work on the human voice, and as husband of a lady who almost succeeded in naturalizing the *salon* in this country. By his will about one million dollars were devoted to the erection and maintenance of an isolated and fire-proof library-building, which was to be named the Ridgway Library, in memory of his wife. This building was offered to the Philadelphia Company, and the bequest was accepted. That institution had by this time accumulated about one hundred thousand volumes, containing many of those rarities for which there is an eternal struggle between the book-hunter and fire, rats, plate-hunters, worms, and kindred vermin. It owns some fine specimens of illuminated manuscripts, exemplars of Caxton, Fust, and Schœffer, the inventors, or at least sharers in the invention, of printing; of Pynson, Wynkyn de Worde, Sweynheym, and Pannartz; a work of Jenson, believed to be unique; of Koburger, and other works irreplaceable if lost. It is therefore gratifying to those who are aware of the heavy toll fire has levied on knowledge to know that the collection has been, in so far as may be, placed out of reach of a danger which the original "twelve leathern fire buckets and a ladder," procured by the directors, might not have averted.

A building of the Doric order was erected, which with its grounds covers an entire square or block, and is calculated to contain four hundred thousand volumes, or three times as many as the Library at present has, and to this building the more valuable books of the Library were removed in 1878; the fiction and more modern works being placed in another designed in imitation of the old edifice, and nearer the center of the city.

When it is added that Dr. Rush's bequest included also the correspondence and papers of his father,—which contain among many others letters from distinguished persons, letters from Washington, Franklin, Hamilton, Kosciuszko, etc., and that mysterious diary of Benjamin Rush which John Adams alludes to, and which played an important part in the controversy between Mr. Bancroft and Mr. William B. Reed, but which nobody seems to have viewed,—it will be seen that few more valuable gifts have been made to the public. To the public, it may be said, for although this library is in its origin and maintenance entirely a private institution, the use of its books is freely given to any respectable reader. I have tried briefly to show that this oldest American library has had an honorable career, and exerted an appreciable and wholly good influence; while illustrating something of that peculiar character of quietness which Philadelphia has retained since Penn directed that the people should so build their houses "that there may be ground on each side for gardens, or orchards, or fields, that it may be a green country town, which will never be burnt and always wholesome." Indeed, few institutions have been more naturally the growth of a community, or better illustrate the good effects of such unstimulated growth, than the old Philadelphia Library.

Bunford Samuel.



LOGANIAN LIBRARY, SIXTH AND WALNUT STREETS.

OLD AGE.

FROM THE MIDDLE DISTANCE.

Say, did you see him? (for I know him not)—
A pilgrim stern, implacable as fate,
Who strolls this way, they say. His shambling gait,
His gray, thin locks, and burdensome long days,
And wrinkled brow he helplessly displays—
And terrors those with whom he tries to plot.
Some callow youth, whose teens have made him wise,
Thinks me this gaffer's follower, I surmise,—
Yet in my heart, I know, I know him not.

How came he here? I call long years of Youth
To witness—or, if any years can tell,
Let them—when I came out of Youth to dwell;
When any summer's dawn or spring did rise
Whereon I looked not with young, trustful eyes.
A part of April's pantheon, I prolong
My days amidst her symphonies of song;
Still, in green-bowered retreats, my pulse unflagging beats,
Through new-born wonders and auroral skies,
With sharp, bewildering freshness and surprise!

The budding, tender maid of me is not afraid;
I catch her sunshine as she passes by—
The welcome in her eye;
Her rosy cheeks and her immaculate lips
Rebuke me not, nor put me in eclipse,—
So, never from Youth's chord a tune of my life varies;
When school-girls, in sweet flocks, greet me with silken locks,
Meet me in field and street, they show me when we meet
That young eyes, blue or black, are my contemporaries.

This gaffer old and gray—how dare he stroll my way?
His dumb lips at my sight would grow still dumber;
His gray hairs I disown, which mate not with my own;
Should he appear to-day, I could not him obey—
For I am one with spring and the warm heart of summer!
May dawns in new decades—her golden morning sets—
And still my hand is moist among her violets;
From out the saffron south the sweet breath of her mouth
About my forehead plays with balm supernal,
Until her life with mine grows steady and eternal.

Who saw him pass? Not I—for still the sky is blue,
And still the summer birds their madrigals are singing.
How shall I find you him of whom I never knew
When Youth with all his pomp his lap of flowers is bringing?
In meadows ever fair I quaff the morning air,
And couriers come to me their wreaths of hope outflinging.
My life still hugs Youth's shore—though years may intervene;
If skies are only blue and fields are ever green,
What need have I to mourn for youth departed?
Time still there is to laugh and youthful joy to quaff,
To frolic through fair days and to be happy-hearted.

Joel Benton.

SALVINI, AS KING LEAR.

[FROM A SKETCH FROM LIFE, BY JOHN W. ALEXANDER.]

SALVINI'S "KING LEAR."

MR. MATTHEW ARNOLD says of Shakspere: "He has the elementary soundness of the ancients, he has their important action and their large and broad manner; in his strong conception of a subject, in the genuine way in which he is penetrated with it, he resembles them and is unlike the moderns." These words apply with equal fitness to Salvini's interpretation of Shakspere. Whatever subtlety he displays is in method and detail. His conception is bold, distinct, and plastic,—as spontaneous and unhampered by tradition as early Greek art. His characters, rounded into balanced symmetry, stand out with the solid relief of sculpture. Delicacy, grace, and fancy are bestowed upon the modeling, the finish; but he represents the grand outlines of a personality with that unerring directness of style, that "important action," that "large and broad manner," which belong only to preëminent genius.

Salvini understands the *motif* of *Lear* to be, not the local peculiarities of a king of ancient Britain, but the passion of fatherhood. "Is not a father in Italy the same as a father in Britain?" are his own words upon the subject, and they clearly illustrate his conception. For him the whole tragedy rests upon the fact that the royal martyrdom is *undeserved;* the moment a thought is entertained that it was occasioned by the king's own lack of foresight or justice, its sublime quality disappears. Viewed in this light, the superhuman figure of *Lear* descends from those loftiest spiritual regions where Job and Prometheus abide, to serve as a warning exemplar of the follies of imprudent generosity—a lesson to confirm the cheap and worldly maxims of the common wisdom of the street. It were an insult to the genius of Shakspere to fancy that such was his design in creating the most sublime impersonation of old age and anguish ever conceived by human imagination. In "Timon of Athens" he shows us the ordinary ingratitude with which the world repays the facile prodigality of a generous, reckless spendthrift. But with *Lear* there is no question of recklessness, of foolishly misplaced confidence in strangers and sycophants: his trust is in his own flesh and blood, his largess is bestowed upon his passionately beloved offspring, to whom he is about to give a signal proof of his supreme affection. What more fitting moment could be selected than the occasion of his daughters' espousals? What wiser and more appropriate act than, while retaining the title and honors of royalty, to renounce its duties and cares, rendered irksome by the inevitable weariness of a ripe old age? His own nature is exuberantly and demonstratively affectionate, and in presence of his whole court he asks his daughters who among them loves him best, simply for the delight of hearing their filial, graceful replies. From *Regan* and *Goneril* he receives dutiful response; then, overflowing with paternal pride and love, he turns to his darling youngest child, the gentlest and meekest of the three, and receives a rebuff discourteous and irreverent enough to affront even a modern and non-royal father: "I love you according to my bond, neither more nor less. I am not yet married, but the first stranger who appears and claims me as his wife will obtain from me a greater meed of affection than you can possibly expect." Whoever transports himself mentally into the period, place, and circumstances of this scene will not consider the wrath of *Lear* exaggerated. Only because of our own difficulty in laying aside the knowledge of Cordelia's true character, which the later portions of the play reveal, do we here sympathize with her, and condemn the perfectly justifiable indignation of the aggrieved parent and monarch.

Lear, as conceived by Salvini, is a man of noble generosity, of exquisite tenderness and sensitiveness, of powerful intellect and imagination. His robust physical force is beginning to wane, though still as a man of eighty he delights in the pleasures of the chase. But there is no trace of senility in the vigorous, richly endowed mind. This conception is amply borne out by the text; for, if the insanity of *Lear* were occasioned by dotage and decrepitude, instead of by the stunning blows of unparalleled misfortunes, there could be no return of reason before his death. Yet, in the last two scenes, Shakspere represents him to be as lucid and sane as though his brain had never been clouded. By accumulating the black and subtle crimes of *Regan* and *Goneril*, the poet emphasizes for us the fact that *Lear* was not imbecile in misjudging them, but that he was dealing here with unnatural monsters such as no human foresight, much less the loving heart of a parent, could have divined. The traits most conspicuously brought out in Salvini's impersonation of *Lear* are majesty, generosity,

tenderness, and self-abnegation. Not for a moment do we forget that he is "every inch a king"; not for a moment do we forget that he is one of the most affectionate and compassionate of men; while the magnitude and sublimity of his sorrows invest him with an atmosphere that partakes of the supernatural. Even in the midst of frenzy and tempest, he remembers the sufferings of others. What can be more profoundly touching than the action, replete with grace and dignity, with which he takes off his mantle in the storm to throw it over the shivering form of the *Fool?* Then, feeling the cold pierce his own uncovered shoulders, he folds in his large, paternal embrace the trembling clown, seeking shelter under one and the same cloak, as who should say "the strong protects the weak, the king protects the humblest of his servants, the man of many sorrows is mindful of the common brotherhood of misfortune." Salvini's acting is so equally sustained, so absolutely natural, that it offers few of those technical "points" conveniently seized upon by the critic. The art of concealing art has never been carried farther. One brings away from his performance of *Lear* such a complete and awe-inspiring impression of the totality of the character, that it were invidious to single out any passage or scene for special admiration. His action swells and subsides in exact cadence with the rhythmical movement of the drama; for he is fully equal to the tremendous heights of passion which Shakspere attains in this play, and he has the reserve and self-control which enable him to hold in abeyance and merely suggest this power when it is not called into requisition by the exigencies of the situation. The grandest point is probably reached in the conclusion of the second act:

> "No, you unnatural hags,
> I will have such revenges on you both,
> That all the world shall—I will do such things,—
> What they are, yet I know not; but they shall be
> The terrors of the earth. You think I'll weep;
> No, I'll not weep:—
> I have full cause of weeping; but this heart
> Shall break into a hundred thousand flaws,
> Or ere I'll weep:—O, fool, I shall go mad!"

Was there ever before concentrated in a human voice such desperate anguish of suppressed sobs, such utter fruitlessness of revolt against unnatural cruelty, as Salvini expresses in these words? He is broken, helpless, and defeated—not with the helplessness of a violent, doting old man, but with the despair of a Titan at war with demons. The immortal scene in which *Lear* recognizes *Cordelia* is depicted with such exquisite gradations of pathos, that we find ourselves hanging upon the scarcely audible words of the reviving "child-changed father," with that breathless, labored suspense with which we might witness an actual restoration from the jaws of death to life. And the climax, reached in the words,

> "Do not laugh at me;
> For, as I am a man, I think this lady
> To be my child Cordelia"—

is as subdued, as low in tone, and as real as had been the preparation for it. Nothing can be more beautiful, more piercingly pathetic than the dissolution of all fever and frenzy in a flood of refreshing tears, and the heart-broken, passionate tenderness with which he clasps her to his breast and bows his head above her own.

Nature, not tradition, is the mistress of Salvini's art. This accounts for the perfect originality and spontaneity of his "stage-business." When he carries the dead *Cordelia* in his arms, he does not lift her like a strong man carrying a child, but he drags her with exhausted force and painful effort, as a weak old man must bear a lifeless body. In his despair, while he hangs above her corpse, he looks wildly around, and snatches at the helmet-plume in *Edgar's* hand, to set it to her lips. "This feather stirs! she lives!" The device is as natural as it is effective. But, from beginning to end of the play, there are no sensational "points," no striking arrangements of artificial methods.* He relies for all effect upon the loftiness of his conception, the majesty of his gestures and carriage, the indescribable harmony of his voice (whose every inflection is music, whether broken with sobs, ringing with passion, or melting with tenderness), and finally upon that absolute identification with the part which years of arduous study, superadded to the natural intuitions of genius, have enabled him to acquire.

During Salvini's engagement in New York, the distinguished German actor, Ludwig Barnay, offered us a rare opportunity for comparing strongly contrasted methods of conceiving *Lear*. The German artist's presentment sparkled with brilliant points; it was full of action, bustle, energy, variety. We knew that *Lear* was old by the token that he wore a flowing white beard and wig; we knew that he was a king because he told us so, and he wore a crown. But there was nothing majestic or venerable in his carriage

* I do not forget the "point," verging upon the melodramatic which he makes in rendering the words "every inch a king." Here he totters toward a leafless tree, breaks a twig from its branches, and waves it pompously as he repeats the phrase. Those critics who condemn this action as being far-fetched and in questionable taste, do not seem to remember that *Lear* is insane when he uses it, and that it is perfectly in keeping with the wild and fitful impulses of an unsettled brain.

and gestures, no trace of physical weakness in his violent and restless manner. The impression Barnay left was of detached traits and fragmentary passages, rather than of a complete image. The most salient feature of his impersonation was the king's insanity, which he invested with an almost painful naturalism, and which singularly enough received rather less than the usual emphasis at Salvini's hands. But, although Herr Barnay's *Lear* is neither sublime nor poetical, and is therefore to be judged on an altogether different plane from that of Salvini, yet in its fiery and potent realism it is a noteworthy and memorable histrionic achievement.

After every new Shaksperean interpretation offered by Salvini, a chorus of critics promptly exclaim against its non-Shaksperean inspiration, its essentially *Italian* quality. If it could be urged as a fault against Salvini's *Othello* that it was "not Anglican," all the more emphatic is the dissatisfaction expressed with a so-called "Italian *Lear*." It is but a repetition of truisms to say that Shakspere's personages are human, universal, that they move in a world of passion, of dramatic and psychological complications over and above all distinctions of race, country, creed, and even sex. His glory is in his revelation of the naked soul; not the least human of his plays are enacted in an imaginary region just beyond the limits of our earth. The magical isle of the "Tempest," the fairy-haunted wood of Athens, the sea-encircled Bohemia of the "Winter's Tale,"—all these, and more, prove his comparative indifference to what are considered the realities of time and space, and his complete perception of the spiritual truths of life. Any actor, therefore, who brings out for us the profound human significance of his great characters, is the true interpreter of Shakspere, and such a one is Salvini. It has always seemed to us a curious fact that any who speak the tongue of Shakspere should wish to rob him of his chief claim to immortality. There are those who insist upon his being insular and local, rather than comprehensive and universal; who resent as an impertinence the very suggestion that his genius may speak as clearly and as intimately to an Italian or a Frenchman as to an Anglo-Saxon. If it were not so—"the less Shakspere he," as Browning puts it. They might as well attempt to confine him to the limits of Stratford, and assert that outside of Warwickshire he could not be properly understood, as to restrict him to the English-speaking or Teutonic races. Voltaire's failure to appreciate him was no more egregious than that of Colley Cibber or of Dr. Johnson, and we are indebted to-day to the brilliant eloquence of a Frenchman, M. Taine, to the intellectual and critical analysis of an Italian, Salvini,* for some of the most discriminating literary studies of Shaksperean characters that have appeared in our day.

It would be childish to dwell upon the real loss inseparable from Salvini's performance of *Lear*, namely, the loss of the English text, with its overpowering beauty, intrinsic and associated. Until we English-speaking people can produce in our generation an actor capable of interpreting the spiritual, as well as the verbal grandeur of Shakspere, it is somewhat inopportune to find fault with Salvini for the foreign medium in which the accident of his birth forces him to transmit the poet's thought. Neither more nor less can be said of his *Lear* than that it is the actual embodiment of that Titanic figure hitherto existing only in our imagination as the *Lear* of Shakspere. With it he worthily closes his repertory of Shaksperean characters. Having accomplished the greatest achievements and won the highest honors of his profession, he retires to his well-earned repose, leaving the memory of an actor whose genius of interpretation is akin, in quality, scope, and degree, to the creative genius of Shakspere himself.

* See THE CENTURY Magazine for November, 1881.

Emma Lazarus.

A SONG.

"THE world turns round and round and round,
The sun sinks into the sea";
And the blossoms fall without a sound
Where the grass grows green and free.

All things are bright in the track of the sun,
All things are fair I see;
And the light in a golden tide has run
Down out of the sky to me.

And the world turns round and round and round,
And my thought sinks into the sea;
The sea of peace and of joy profound
Whose tide is mystery.

Samuel Willoughby Duffield.

THE ENGLISH VOLUNTEERS DURING THE LATE INVASION.

THE most painful event since the bombardment of Alexandria has been what is called by an English writer the "invasion" of "American Literature in England." The hostile forces, with an advanced guard of what was regarded as an "awkward squad," had been gradually effecting a landing and a lodgment not unwelcome to the unsuspicious natives. No alarm was taken when they threw out a skirmish-line of magazines, and began to deploy an occasional wild poet, who advanced in buckskin leggings, revolver in hand, or a stray sharp-shooting sketcher clad in the picturesque robes of the sunset. But when the main body of American novelists got fairly ashore and into position, the literary militia of the island rose up as one man, with the strength of a thousand, to repel the invaders and sweep them back across the Atlantic. The spectacle had a dramatic interest. The invaders were not numerous, did not carry their native tomahawks, they had been careful to wash off the frightful paint with which they usually go into action, they did not utter the defiant whoop of Pogram, and even the militia regarded them as on the whole "amusin' young 'possums"—and yet all the resources of modern and ancient warfare were brought to bear upon them. There was a crack of revolvers from the daily press, a lively fusillade of small-arms in the astonished weeklies, a discharge of point-blank blunderbusses from the monthlies; and some of the heavy quarterlies loaded up the old pieces of ordnance, that had not been charged in forty years, with slugs and brickbats and junk-bottles, and poured in raking broadsides. The effect on the island was something tremendous: it shook and trembled and was almost hidden in the smoke of the conflict. What the effect is upon the invaders, it is too soon to determine. If any of them survive, it will be God's mercy to his weak and innocent children.

It must be said that the American people—such of them as were aware of this uprising—took the punishment of their presumption in a sweet and forgiving spirit. If they did not feel that they deserved it, they regarded it as a valuable contribution to the study of sociology and race characteristics, in which they have taken a lively interest of late. We know how it is ourselves, they said; we used to be thin-skinned and self-conscious and sensitive. We used to wince and cringe under English criticism, and try to strike back in a blind fury. We have learned that criticism is good for us, and we are grateful for it from any source. We have learned that English criticism is dictated by love for us, by a warm interest in our intellectual development, just as English anxiety about our revenue laws is based upon a yearning that our down-trodden millions shall enjoy the benefits of free trade. We did not understand why a country that admits our beef and grain and cheese should seem to seek protection against a literary product which is brought into competition with one of the great British staples, the modern novel. It seemed inconsistent. But we are no more consistent ourselves. We cannot understand the action of our own Congress, which protects the American author by a round duty on foreign books and refuses to protect him by granting a foreign copyright; or, to put it in another way, is willing to steal the brains of the foreign author under the plea of free knowledge, but taxes free knowledge in another form. We have no defense to make of the state of international copyright, though we appreciate the complication of the matter in the conflicting interests of English and American publishers.

Yes; we must insist that, under the circumstances, the American people have borne this outburst of English criticism in an admirable spirit. It was as unexpected as it was sudden. Now, for many years our international relations have been uncommonly smooth, oiled every few days by complimentary banquet speeches, and sweetened by abundance of magazine and newspaper "taffy." Something too much of "taffy" we have thought was given us at times, for, in getting bigger in various ways, we have grown more modest. Though our English admirers may not believe it, we see our own faults more clearly than we once did,—thanks, partly, to the faithful castigations of our friends,—and we sometimes find it difficult to conceal our blushes when we are over-praised. We fancied that we were going on, as an English writer on "Down-Easters" used to say, as "slick as ile," when this miniature tempest suddenly burst out in a revival of the language and methods used in the redoubtable old English periodicals forty years ago. We were interested in seeing how exactly this sort of criticism that slew our literary fathers was revived now for the execution of their degenerate children. And yet it was not exactly the same. We used to call it "slang-whanging."

One form of it was a blank surprise at the pretensions of American authors, and a dismissal with the formula of previous ignorance of their existence. This is modified now by a modest expression of "discomfiture" on reading of American authors "whose very names, much less peculiarities, we never heard of before." This is a tribunal from which there is no appeal. Not to have been heard of by an Englishman is next door to annihilation. It is at least discouraging to an author who may think he has gained some reputation over what is now conceded to be a considerable portion of the earth's surface, to be cast into total obscurity by the negative damnation of English ignorance. There is to us something pathetic in this and in the surprise of the English critic, that there can be any standard of respectable achievement outside of a seven-miles radius turning on Charing Cross.

The pathetic aspect of the case has not, however, we are sorry to say, struck the American press, which has too often treated with unbecoming levity this unaccountable exhibition of English sensitiveness. There has been little reply to it; at most, generally only an amused report of the war, and now and then a discriminating acceptance of some of the criticism as just, with a friendly recognition of the fact that on the whole the critic had done very well considering the limitation of his knowledge of the subject on which he wrote. What is certainly noticeable is an entire absence of the irritation that used to be caused by similar comments on America thirty years ago. Perhaps the Americans are reserving their fire as their ancestors did at Bunker's Hill, conscious, maybe, that in the end they will be driven out of their slight literary entrenchments. Perhaps they were disarmed by the fact that the acrid criticism in the London "Quarterly Review" was accompanied by a cordial appreciation of the novels that seemed to the reviewer characteristically American. The interest in the latter's review of our poor field must be languid, however, for nobody has taken the trouble to remind its author that Brockden Brown — who is cited as a typical American writer, true to local character, scenery, and color — put no more flavor of American life and soil in his books than is to be found in "Frankenstein."

It does not, I should suppose, lie in the way of THE CENTURY, whose general audience on both sides of the Atlantic takes only an amused interest in this singular revival of a traditional literary animosity, — an anachronism in these tolerant days when the reading world cares less and less about the origin of literature that pleases it, — it does not lie in the way of THE CENTURY to do more than report this phenomenal literary effervescence. And yet it cannot escape a certain responsibility as an immediate though innocent occasion of this exhibition of international courtesy, because its last November number contained some papers that seem to have been irritating. In one of them Mr. Howells let fall some chance remarks on the tendency of modern fiction, without adequately developing his theory, which were largely dissented from in this country, and were like the uncorking of six vials in England. The other was an essay on England, dictated by admiration for the achievements of the foremost nation of our time, which, unfortunately from the awkwardness of the eulogist, was the uncorking of the seventh vial — the uncorking of which, we happen to know, so prostrated the writer that he resolved never to attempt to praise England again. His panic was somewhat allayed by the soothing remark in a kindly paper in the "Blackwood's Magazine" for January, that the writer had discussed his theme "by no means unfairly or disrespectfully." But with a shudder he recognized what a peril he had escaped. Great Scott! — the reference is to a local American deity who is invoked in war, and not to the Biblical commentator — what would have happened to him if he had spoken of England "disrespectfully"!

We gratefully acknowledge also the remark of the "Blackwood's" writer in regard to the claims of America in literature. "These claims," he says, "we have hitherto been very charitable to." How our life depends upon a continual exhibition by the critics of this divine attribute of charity it would perhaps be unwise in us to confess. We can at least take courage that it exists — who does not need it in this world of misunderstandings? — since we know that charity is not puffed up, vaunteth not itself, hopeth all things, endureth all things, is not easily provoked; whether there be tongues, they shall cease; whether there be knowledge, it shall vanish; but charity never faileth. And when all our "dialects" on both sides of the water shall vanish, and we shall speak no more Yorkshire or Cape Cod, or London cockney or "Pike" or "Cracker" vowel flatness, nor write them any more, but all use the noble simplicity of the ideal English, and not indulge in such odd-sounding phrases as this of our critic that "the combatants on both sides were by way of detesting each other," though we speak with the tongues of men and of angels — we shall still need charity.

It will occur to the charitable that the Americans are at a disadvantage in this little

international "tiff." For while the offenders have inconsiderately written over their own names, the others preserve a privileged anonymity. Any attempt to reply to these voices out of the dark reminds one of the famous duel between the Englishman and the Frenchman which took place in a pitch-dark chamber, with the frightful result that when the tender-hearted Englishman discharged his revolver up the chimney he brought down his man. One never can tell in a case of this kind but a charitable shot might bring down a valued friend or even a peer of the realm.

In all soberness, however, and setting aside the open question, which country has most diverged from the English as it was at the time of the separation of the colonies from the mother-land, we may be permitted a word or two in the hope of a better understanding. The offense in THE CENTURY paper on "England" seems to have been in phrases such as these:—"When we began to produce something that was the product of our own soil and of our own social conditions, it was still judged by the old standards"; and, we are no longer irritated by "the snobbishness of English critics of a certain school," "for we see that its criticism is only the result of ignorance—simply of inability to understand."

Upon this the reviewer affects to lose his respiration, and with "a gasp of incredulity" wants to know what the writer means, "and what standards he proposes to himself when he has given up the English ones?" The reviewer makes a more serious case than the writer intended, or than a fair construction of the context of his phrases warrants. It is the criticism of "a certain school" only that was said to be the result of ignorance. It is not the English language nor its body of enduring literature—the noblest monument of our common civilization—that the writer objected to as a standard of our performances. The standard objected to is the narrow insular one (the term "insular" is used purely as a geographical one) that measures life, social conditions, feeling, temperament and national idiosyncracies expressed in our literature, by certain fixed notions prevalent in England. Probably also the expression of national peculiarities would diverge somewhat from the "old standards." All we thought of asking was that allowance should be made for this expression and these peculiarities, as it would be made in case of other literatures and peoples. It might have occurred to our critics, we used to think, to ask themselves whether the English literature is not elastic enough to permit the play of forces in it which are foreign to their experience. Genuine literature is the expression, we take it, of life—and truth to that is the standard of its success. Reference was intended to this, and not to the common canons of literary art. But we have given up the expectation that the English critic "of a certain school" will take this view of it, and this is the plain reason—not intended to be offensive—why much of the English criticism has ceased to be highly valued in this country, and why it has ceased to annoy. At the same time, it ought to be added, English opinion, when it is seen to be based upon knowledge, is as highly respected as ever. And nobody in America, so far as we know, entertains, or ever entertained, the idea of setting aside as standards the master-minds in British literature.

In regard to the "inability to understand," we can, perhaps, make ourselves more clearly understood, for the "Blackwood's" reviewer has kindly furnished us an illustration in this very paper, when he passes in patronizing review the novels of Mr. Howells. In discussing the character of Lydia Blood, in "The Lady of the Aroostook," he is exceedingly puzzled by the fact that a girl from rural New England, brought up amid surroundings homely in the extreme, should have been considered a lady. He says:

> "The really 'American thing' in it is, we think, quite undiscovered either by the author or his heroes, and that is the curious confusion of classes which attributes to a girl brought up on the humblest level all the prejudices and necessities of the highest society. Granting that there was anything dreadful in it, the daughter of a homely small farmer in England is not guarded and accompanied like a young lady on her journeys from one place to another. Probably her mother at home would be disturbed, like Lydia's aunt, at the thought that there was no woman on board, in case her child should be ill or lonely; but, as for any impropriety, would never think twice on that subject. The difference is that the English girl would not be a young lady. She would find her sweetheart among the sailors, and would have nothing to say to the gentlemen. This difference is far more curious than the misadventure, which might have happened anywhere, and far more remarkable than the fact that the gentlemen did behave to her like gentlemen, and did their best to set her at ease, which we hope would have happened anywhere else. But it is, we think, exclusively American, and very curious and interesting, that this young woman, with her antecedents so distinctly set before us, should be represented as a lady, not at all out of place among her cultivated companions, and ready to become an ornament of society the moment she lands in Venice."

Reams of writing could not more clearly explain what is meant by "inability to understand" American conditions and to judge fairly the literature growing out of them; and reams of writing would be wasted in the attempt to make our curious critic comprehend the situation. There is nothing in his experience of "farmers' daughters" to give him

the key to it. We might tell him that his notion of a farmer's daughters in England does not apply to New England. We might tell him of a sort of society of which he has no conception and can have none, of farmers' daughters and farmers' wives in New England—more numerous, let us confess, thirty or forty years ago than now—who lived in homely conditions, dressed with plainness, and followed the fashions afar off, did their own household work, even the menial parts of it, cooked the meals for the "men folks" and the "hired help," made the butter and cheese, and performed their half of the labor that wrung an honest but not luxurious living from the reluctant soil. And yet those women—the sweet and gracious ornaments of a self-respecting society—were full of spirit, of modest pride in their position, were familiar with much good literature, could converse with piquancy and understanding on subjects of general interest, were trained in the subtleties of a solid theology, and bore themselves in any company with that traditional breeding which we associate with the name of lady. Such strong native sense had they, such innate refinement and courtesy,—the product, it used to be said, of plain living and high thinking,—that, ignorant as they might be of civic ways, they would, upon being introduced to them, need only a brief space of time to "orient" themselves to the new circumstances. Much more of this sort might be said without exaggeration. To us there is nothing incongruous in the supposition that Lydia Blood was "ready to become an ornament to society the moment she lands in Venice."

But we lack the missionary spirit necessary to the exertion to make our interested critic comprehend such a social condition, and we prefer to leave ourselves to his charity, in the hope of the continuance of which we rest in serenity.

Charles Dudley Warner.

HALF-LIVES.

I.

Two were they, two; but one
They might have been. Each knew
The other's spirit-fittest mate—apart.
Ah, hapless! though once jealous Fortune drew
Them almost heart to heart,
In a brief-lighted sun!

II.

So near they came, and then—they are
So far!
They seemed like two who pass,
Each on a world-long journey opposite,
Their two trains hurrying dark
With long-drawn roar through the dread deep of night,
(O faces close—they almost touched, alas!
O hands that might have thrilled with meeting spark!
O lips that might have kissed!
O eyes with folded sight
Dreaming some vision bright!)
In darkness and in mist.

John James Piatt.

THE ABORIGINES AND THE COLONISTS.*

BY EDWARD EGGLESTON.

I.

FIRST ACQUAINTANCE.

"TALL, handsome timbered people," is the phrase by which one of the earliest travelers in New England describes the Indians, and he adds that "the *Indesses* that are young are some of them very comely — many pretty brownettos and spider-fingered lasses may be seen among them." He frankly adds that the savages are "very fingurative or thievish," and "importunate beggars" withal. Mutual curiosity, followed by barter, by attempts at religious conversion, and by a hostility from which there seemed to be no escape, are the ever-recurring phases of the contact of the white and red races in all parts of North America. With fresh and wondering eyes the explorers sent by Ralegh saw the stately Indians who came to trade on the decks of their vessels, and the later comers in James River looked with a similar curiosity at the chief who marched to welcome them at the head of a procession, while he played upon a scrannel pipe of reed. It is hard for us to imagine the wonder with which these untraveled Englishmen regarded savages who wore their hair cut short like a cock's comb in the middle of the head, one side of which was shaved and covered by a copper plate; who decked their painted bodies with birds' feathers; and wore, besides other "conundrums," such ear-ring pendants as bears' or hawks' claws, living snakes, or "dead rats by the tail"; sometimes, also, the dried hand of a human enemy dangled under a face painted to produce a horrible effect.

The Indians, on their part, held superstitious notions of the new-comers, whom they regarded as in some sort *manitos*, or demons, on account of their apparently magical skill. When the black slaves were brought, however, the savages at Manhattan revised their theory; these blacks were "the true breed of devils," they exclaimed. The mysterious articles of the white man's manufacture were all supernatural in Indian eyes. Thomas Harriott, the great mathematician, a member of Ralegh's colony, zealously read the Bible in the hamlets of the North Carolina tribes, who thereupon paid homage to the book. Harriott's scientific instruments, the loadstones, burning-glasses, fireworks, guns, fish-hooks, and, yet more, a spring clock that "went of itself," were also considered supernatural. On the hill by New Amsterdam, the Indians watched the ghostly wings of the windmill, moved by a power invisible, and to them it was "the world's wonder; they durst not come near his long arms and teeth biting to pieces."

But all the childish curiosity and all the erroneous notions were not on the side of the savages. The early travelers and settlers believed with singular unanimity that Indians were born white; even the French Jesuit writers who dwelt among them would have it that the color of their skins was due to their nudity and to bear's-grease, while Josselyn states explicitly that the Indian babes in New England were dyed with hemlock bark, tanned like leather, as one might say; and so late as 1681, William Penn pronounces them black as gypsies, "but by design."

The institutions of the Indians are seen through English eyes by all the colonists. Petty chiefs of a few hundred or, at most, two or three thousand bowmen, are "kings," and we read of a message sent from Pennsylvania to the "Emperor of Canada" — some Iroquois head man, no doubt. The chief's squaw was always a "queen" or an "empress," and the little naked Pocahontas was a royal "princess." We grow tired of thinking how great a mob of kings and emperors there were in this savage wilderness, and are relieved when a more modest writer speaks of "one Black William, an Indian duke." In like manner, the "medicine-men," or professional conjurors and jugglers, were regarded by the earlier voyagers as the priests of a regular worship of the sun or of the devil.

A favorite topic for the display of learned folly in Europe and America in the seventeenth and eighteenth centuries was the origin of the Indians. At a very early period they were the cursed children of Canaan, the son of Ham; then it was shrewdly guessed that they came from Joktan, and their affiliation might quite as reasonably have been fixed upon almost any of the other names in the biblical genealogies. However, the eminent

Dutch scholar, Grotius—"the Oracle of Delft"—discovered that the Americans could not be, as various writers had maintained, Scythians, Moors, Tartars, or what not, but must be of Hebrew descent. This hypothesis, founded on the similarity of customs among primitive peoples, served to quicken the hopes of the apostle Eliot, and to stimulate the liberality of sentimental people in England, who were pleased to find Americans in their Bibles, if only by far-fetched inference. And did not the Indians, like the ancient Jews, anoint their heads, dance after a victory, compute time by nights and moons, speak in parables, and make "grievous mournings and yellings" for their dead? But there were rival theories in vogue, some of them mixed up with an incomprehensible jargon about Gog and Magog. Dr. Mede, a famous English theologian, propounded one which was regarded by some in New England "as the oracle of God." It was that some centuries after Christ, the devil, becoming alarmed lest his worship should be quite expelled from the world, induced some of the heathen of the north of Europe to undertake a passage to a promised land in America, thus making himself "the ape of God," who had led his chosen people in this way. The conclusion was that, although it might be found impossible to convert the devil-worshipers, yet it would be a work "pleasing to Almighty God and our Blessed Saviour to affront the devil with the sound of the Gospel where he had hoped to escape the din thereof."

This theory of Dr. Mede was suitable to the state of feeling in New England in the time of Philip's war, and accorded with the belief, prevailing so persistently, that the American Indians worshiped devils, and held audible and visible communication with Satan through their diviners or medicine-men. Champlain declares that the priests of the Algonkins talk visibly with the devil; and Whittaker, the "Apostle of Virginia," says that the Indians are "naked slaves of the devil," and that their priests are no better than English witches. Strachey, secretary of the Virginia colony, thinks that their "connivres" are able to detect theft by the devil's help; and Lawson had heard that, while the conjurations of Carolina Indians were in progress, there was a significant "smell of brimstone in the cabins." The pilgrims at Plymouth recognized the power of Indian jugglers to fetch rain; the Jesuits of Canada equally believed in their magical skill; and a Dutch clergyman at Fort Orange avers that they had so much witchcraft, divination, sorcery, and wicked tricks, that they could not be held in by any bands or locks. Josselyn says that the medicine-men of New England were invulnerable—"shot free and stick free"; while one of the earliest fur-traders of Maine declares that the Indians were all witches. Roger Williams lovingly calls the savages "wild brethren and sisters," but, after having once seen a medicine-dance, he "durst never be an eye-witness, spectator, or looker-on," lest he should have been "partaker of Sathan's inventions and worship"; and he grants that the powwows "doe most certainly by the help of the Divell work great cures." An intelligent writer on New York in 1670 relates with implicit belief that the medicine-men were wont to materialize a spirit at the green-corn feast, which now and then went so far as to carry off some of the spectators while the conjuror was taking the collection customary on all such occasions. But this demon was, after the manner of his kind, shy of irreverent skeptics and investigators; he would never appear until all the white men had been put out. A hundred years after Roger Williams, David Brainerd, missionary to the Delawares, witnessing the same ceremony did not flee like Williams, but attempted exorcism. "At a distance, with my Bible in my hand," he says, "I was resolved, if possible, to spoil the spirit of powwowing, and prevent their receiving an answer from the infernal world." One reason given for the cruel attack made by the Dutch director, Kieft, upon the savages of New Netherland, in 1642, was that the natives were making him the subject of diabolical incantations; and in the first code of laws promulgated for the government of New York after its capture by the English, it is enacted that no Indian shall "at any time be suffered to powaw or performe outward worship of the Devil in any Towne within this government." Similar statutes in other colonies were aimed at giving the devil discomfort.

Almost all the tribes with which the English came in contact in the first epoch of colonization were of the Algonkin stock, and spoke cognate languages. This race of Indians occupied the coast from the St. Lawrence to the Carolinas, and of the interior it held almost all the territory north of the Ohio between the Alleghanies and the Mississippi, and stretched away to the Saskatchewan Valley in British America. John Smith, in the waters of the Chesapeake, and the Dutch at Fort Orange, where Albany now stands, reached early the powerful Iroquois race, who, in the Five Nations of New York,—the Hurons of Canada, the Eries, and the Neuter Nation of the intermediate country about the lakes, and the Susquehannahs and Tuscaroras of the Piedmont region of Maryland, and North Carolina,—formed an island,

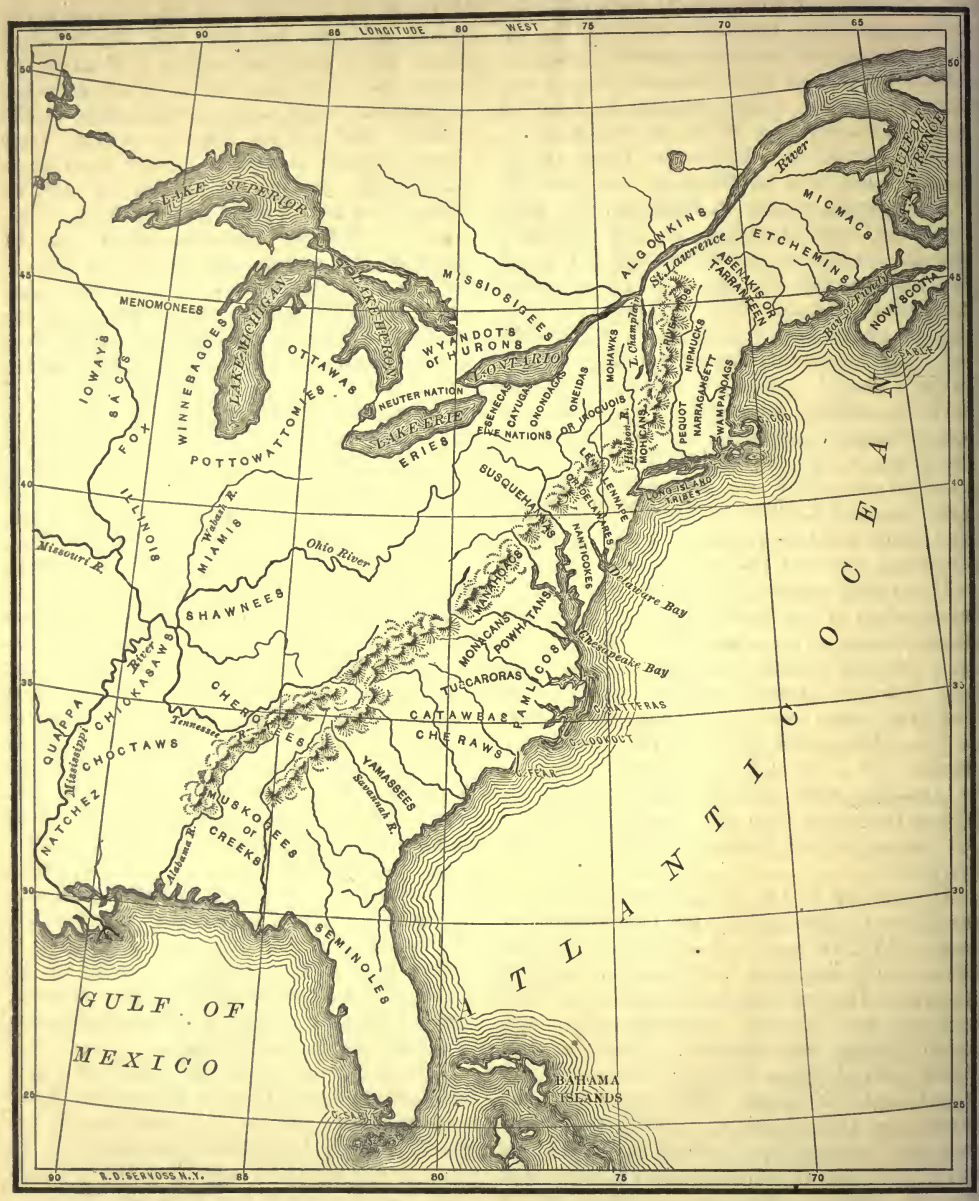

CHART SHOWING THE APPROXIMATE LOCATION OF THE MORE PROMINENT INDIAN TRIBES WHEN FIRST KNOWN TO EUROPEANS.

or islands, wholly surrounded by Algonkins. The southern colonies were in contact with tribes of the Muscogee family,—the Creeks, Choctaws, and Chickasaws. It is only by language and customs that this classification can be made; the lines of alliance and hostility among the Indians did not conform to those of race and speech, and the universal adoption of captives, especially of children taken in war, stood in the way of any very marked diversity of physical appearance or mental characteristics.

II.

LESSONS LEARNED FROM THE BARBARIANS.

THE Indian manner of living, learned from the climate and the hard necessities of the wilderness, afforded many suggestions to the colonists. In Virginia, as in New England, the planting of the Indians' corn saved the first settlers from starvation, and the white men imitated the Indian method of planting and cooking it. Having no iron, the savages cleared their fields awkwardly by girdling the

trees and letting them stand, if the forest was not dense, or by burning down the tree, and then severing the trunk into logs by means of little fires. The stone axes used in some tribes were accounted precious and were handed down as heir-looms. They were provided with helves by splitting a cleft in a young tree and inserting the ax; here it remained until the wood had grown about it, when a section of the sapling was taken out with the ax inclosed. The Southern Indian twisted a hickory withe about the ax-head for a handle. Even after they had got iron tools from the whites, it suited the indolent temper of the race better to burn down the trees than to chop them. They had hoes made of wood, of a turtle-shell affixed to a stick, or of a sharp stone, or a deer's shoulder-blade similarly arranged. The corn was planted as our farmers plant it, in hills three or four feet apart, with four or five grains in a hill. Beans grew about the stalk then as now, and pumpkins or squashes filled the intervening space.

The very names of our dishes are witnesses that the European-Americans learned many ways of cooking from the Indians. Pone, hominy, samp, succotash, and supawn are words borrowed from the aboriginal tongues; and the preparations of Indian corn which bear these names were served in wigwams, no doubt, for ages before white men had ever seen the gay streamers and waving tassels of the maize-field. On a hot stone, or the bottom of an earthern vessel set before the fire, the aboriginal baked what the pioneer afterward baked on his hoe and called a hoe-cake; the toothsome southern "ash-cake" was also first made by the squaws, who shrouded it in husks before committing it to the fire. The Indians knew how to hull corn by applying lye. They celebrated the coming of the delicious green "roasting-ears" by a solemn feast. They nourished infants and invalids with maize-gruel, and they were before us also with the merry pop-corn—"the corn that blossomed," as the Hurons called it.

But "our wild brethren and sisters," used Indian corn in ways unknown to us; it was their chief food, and they "put it through all its sauces." Jerusalem artichokes, dried currants, powdered mulberries,—indeed, almost all other sorts of fruit and flesh,—were mixed with it. They cooked little doughnuts of meal by dropping them into maple syrup. One of their most useful preparations was probably that which, in Virginia, was called *rockahominy*, and in New England, *nokick*—simply parched corn pulverized, and carried in a pouch in journeying; it was mixed, before eating, with snow in winter and with spring water in summer. They used maize for many other things: of the meal they made poultices; with a bowl of mush, given by the bride to her new lord, some tribes celebrated marriages; by means of the grains of maize, to represent a penny or stiver, the savage cast up his accounts with the trader; grains of corn were sent as tickets to those who were bidden to a feast; and, by putting them into gourds and turtle-shells, rattles were made. The husks they braided for mats and wrought into baskets, into light balls for some of their games, into salt-bottles, and even shoes, long before the white man took the hint and made of them chair-bottoms, floor-mats, and collars for horses. Maize was worshipped as a divinity. Children were kept in the field to watch the precious grain as it grew; but some of the tribes protected the thievish crow, because of the legend that a crow had brought them the first seed of the plant which supported their life on so many sides.

From the aborigines the settlers learned the use of other articles of food, such as the persimmon of the South, and the so-called ground-nut of the North. Penn found the savages eating baked beans, as white people do yet in Boston. The festoons of drying pumpkin in the frontierman's cabin are imitated from the Indians.

None knew better than the red men with what last resorts to sustain life in time of famine. The roving Adirondacks, who planted little, if at all, were called "tree-eaters" by their enemies, because they were often obliged to subsist on the "rock-tripe" lichen, and the inner bark and buds of trees. The starving condition to which many of the European pioneers were reduced obliged them to learn to eat the food with which the savages supplied their wants. The first Virginia settlers were glad to feed on the green snake, and a hundred years later the meat of the rattlesnake was regarded as "dainty food" by some of the planters. The Indians were not epicures. Even their varied preparations of maize must have been insipid from the lack of salt in most of the tribes. But a savage appetite is not fastidious. Putrid meat, whole frogs, the intestines of the deer just as taken from the animal, and fish-oil or bear's oil, even when rancid, were not refused. Fruit was not suffered to ripen, lest others should find it; the tree was felled, and the fruit, sour and acrid as it was, consumed at once.

The Indian's wigwam was too easily made and too well suited to the pressing needs of the settlers, not to be occasionally used. All the tribes in the country east of the Alleghanies built bark-houses, though of varying degrees of excellence and stability. In a place

of temporary dwelling, or among the more shiftless tribes, it was but a rude little shelter, with a hole at the side by which the owner entered and the smoke came out. The Iroquois race, on the other hand, as well as some Algonkin tribes, constructed an elaborate compound wigwam of bark, capable of holding a clan of many families, of affording some rude conveniences, and of fending the bitter northern cold. The Indians of Virginia and the Carolina coast built houses of red cedar bark, sometimes fifty or a hundred feet long; while the Muscogees, and perhaps others, had winter-houses of logs. But the house of bark was almost universal, and was so well suited to the roving life and easy habits of the savage that even the apostle Eliot could persuade but few of his converts to accept the white man's house. The majority thought it an advantage that they could easily remove the wigwam, and thus be rid of the vermin.

In Virginia, the primitive cabins of Jamestown borrowed the bark roof and other features from the wigwam. The best of these cabins were decorated with brightly colored Indian mats, which the exiled gentry of Lord De la Warre's time playfully compared to "arras hangings and tapestry." In Massachusetts many of the poorer settlers dwelt at first in tents and booths, and for a long time after in wigwams. In Maryland, the first comers shared an Indian village with the original owners. In East Jersey, the settler erected in a single day a wigwam that served him until he could build a palisade house. The Quakers in West Jersey were glad to winter in Indian wigwams at first. In the warmer climate of Frederica, in Georgia, bowers of palmetto-leaves took the place of the preliminary bark shelter. Perhaps the only surviving relic of the Indian mode of building among the white people in the Eastern States is the bark "camp"—a sort of wigwam—still used as a place of temporary abode by sportsmen in the northern forests.

With the bark-cabin, with maize, and with tobacco, came the only social customs derived from the Indians by the colonists. When a wigwam was to be built, land to be opened for corn, or other difficult work to be done, the Indian called out all of his neighbors; the husking of the maize, too, was always attended by a merry crowd. Such customs were well suited to the physical and social wants of a community in the wilderness; the "house-raising," the "wood-chopping" and the "apple-peeling" came to be as universal among the colonists as among the Indians. In New England, the word "bee" was invented as a generic name for parties of this sort. The practice of smoking together by the wayside and elsewhere, in sign of friendship, which the Puritan law-makers thought too pleasant to be harmless, was an Indian custom; among the tribes of the great interior valley it had come to be in some cases a state solemnity, so that the calumet or peace-pipe was the safe-conduct of an ambassador.

The make-shifts of the wilderness were early acquired from the savages: modes of hunting, of trapping, and of traveling, the "blazing" of trees to mark new forest-paths, the twisting of ropes from the inner bark of the slippery elm, and other devices for meeting the exigences of forest living. For years the Plymouth pilgrims pounded their corn in wooden mortars, after the primitive manner of their neighbors; and the same practice prevailed in other pioneer settlements. The Virginians were still using the fish-weir at the period of the Revolution. When the Southern or Western farmer, dressing his swine, drops hot stones into a barrel of water until it boils, he makes use of a device common to those tribes of Indians that had only wooden vessels. The making of sugar from the maple was practiced by the Indians, who boiled the sap in earthen pots. The pine-knot candle, so generally used in the cabins of the colonists, had lighted the smoky wigwams, no doubt, for ages before Europeans arrived. The canoe made by excavating a log is still in use: the Indian wrought it painfully by burning the wood and scraping it out with shells or stones. If one may believe the reports, there were some canoes, probably of bark, among the Long Island tribes, that would carry eighty men apiece; those carrying half that number were not uncommon. The birch-bark canoe —the Indian's masterpiece—still holds its own among the Northern trappers, guides, and *voyageurs*, as does also the ingenious network snow-shoe. So, too, the dressing of skins with the brains of the animal, and the making of basket-splints by pounding ash-wood until the "growths" separate, are lessons which the frontierman learned from the savage.

It is evident that the contributions of the red race to pioneer life in this country were many and important. In estimating the influence of the Indians on colonial character, we must take into account the corruption of manners on the frontier, proceeding from the trickery which always accompanies trade with ignorant and childish savages, and from the irregular relations of white men with Indian women. The idleness and the paucity of moral restrictions in savage life rendered it attractive to reckless men. The New England lawgivers punished dwellers in the tents of the heathen for their pagan way of living;

one such straggler is described as "a sad wretch; he never heard a sermon but once these fourteen years." The many degenerate white men who lingered among the Southern tribes are spoken of by the naturalist Brickell as "a lost and unfortunate sort of people." These Southern lotus-eaters attributed their long loitering to the waters of Herbert's Spring at the head of the Savannah: whoever drank of this fountain was doomed to spend seven years in the wilderness beyond. The superstition became a fixed one; men fainting with thirst passed by the fatal fountain without drinking, fearing to "pluck the fruit of the forbidden ground."

III.

DECAY OF THE OLD LIFE OF THE INDIAN.

On the other hand, every part of the Indian's life was disturbed by the approximation of civilization. Savages who had not yet advanced beyond the stage of stone hatchets and chronic inter-tribal warfare, were not suffered to develop into that of iron implements and commercial activity through tedious cycles by the slow processes of race culture and natural selection, but were overwhelmed by the premature arrival of a complex civilization out of another world. The flint hatchet and the spear tipped with deer's horn did not grow by degrees into the thousand implements of the world of artificers; they were abolished suddenly while yet the people whose intelligence was gauged by them were incapable of accepting the new life which had engulfed their old. The economic equilibrium of savagery was overturned. The hoe was a helpful addition to the Indian's power, but fire-arms and the white man's commodities broke down the old relation of supply and demand in his life; the necessity for exertion became less strenuous, wild animals were more easily killed with the new weapons, and unwonted supplies could be bought from the trader with furs and deer-skins. Under the augmented demand the fur-bearing animals soon grew scarce; with the increased facilities for capture, game disappeared. By this time new habits had been formed, and new wants aggravated the misery of savage life; the son of the fierce, indolent, and independent warrior found himself a parasite — a hewer of wood for the white man. It is not surprising that, in despair and blind resentment, the Indian tribe sometimes dashed itself to pieces in futile resistance to the incoming civilization.

Not that Indian life was, at its best, a desirable or endurable mode of existence for any but one who had the tastes of a savage. It was squalid, inconvenient, and miserable, with the addition of life-long insecurity growing out of perpetual inter-tribal warfare. Even in the cabins of the Creek tribes, and in the fixed bark-houses of the Iroquois-Huron race, there was no furniture but the rudest implements, and a platform covered with skins or mats for a bed, and used by all the family. There were no provisions for privacy or decency. The higher Algonkins, like the Powhatans and some others, were not better provided for; while the roving tribes of mere hunters had never more of household goods than could be conveniently packed upon the back of a squaw, and carried by a strap across her forehead. If we could assemble the implements and utensils possessed by all the different tribes, —the knives of horn, the baskets of husks and splints, the pails of bark; the mats for doors, house-lining, and beds; the bone awls for sewing and drilling wampum; the canoes of various sorts; the wooden, earthenware, and even soap-stone vessels; the spears, bows, arrows, war-clubs, and stone axes, with the rude threddles of the Muscogees,—we should have a considerable variety. But the number of kinds possessed by any one tribe was small, and the articles owned by any one family were exceedingly few.

The lightly built Indian village was usually removed when the fire-wood became scarce or the corn-ground showed signs of exhaustion; whole tribes would be jostled out of their places by an aggressive enemy, who made their villages too insecure even for the endurance of a savage. By a few reverses, a tribe might be partly exterminated and wholly broken up. Its remaining members were then forced to incorporate with other nations for protection. Thus boundaries, always uncertain, were ever receding, or advancing, or wholly vanishing.

The arrowheads of flint or horn, turkey-spur or eagle-claw, the vessels of earthenware or steatite, the fish-hooks of bone and the richly decorated costumes of buckskin, silk-grass, turkey and other plumage, and of fur,—sometimes skillfully painted on the smooth side, so that "they looked like lace," or decorated with dyed porcupine-quills and the bright-colored skins of ducks' heads,—showed that the Indians possessed ingenuity, and, on occasion, patient application. But the range of their ingenuity was narrow, and their diligence needed the goad of necessity, or the spur of their inordinate passions for revenge and display. There was never among them a spontaneous movement to acquire the arts of the white man. It was enough for them to get, by trade or pilfering, or in war, the articles which the Europeans made. Of all the new

plants brought in by the colonists, the Iroquois adopted only the apple and pear trees, and the Delaware peaches. The Indians often preferred to buy their tobacco of the white man, and they even sometimes depended on trading furs for a supply of maize, thus tending to lose their small agricultural advancement.

Almost every convenience procured from the Europeans brought disturbance to the old mode of living. The dog having been, with the exception of tame birds, the Indian's only brute companion, it was long before his life could be adjusted to the slight addition of a second domestic animal. The Hurons, on receiving horses from the French, were filled with childish delight, and the men volunteered to assist the women in getting fire-wood — the driving of horses was a new diversion for idlers. But the gift was a fatal one at first: the horses ate the unfenced maize, and the village was thrown into consternation. When iron and brass kettles, with poor iron hatchets manufactured on purpose for the Indian trade, could be had in exchange for beaver-skins, there was no longer need for the laborious making of earthen pots or stone hatchets; the rudimentary arts of pottery and stone-cutting were quickly forgotten, and the Indian took a step backward in becoming by so much less an artificer and by so much more a mere hunter. Even the shell-beads which the sea-coast Indians manufactured with so much toil and painstaking, for ornament and money, were better made by the Dutch at Hackensack and Albany. The elaborate fur garments were ripped up and sold, and their kind made no more; the duffel cloth, without so much as a hem or seam, was thrown about the shoulder, and the Indian was more than before a savage. His guns, his traps, his knives, his hatchets, his outer garment, and his wampum money, were all purchased in exchange for skins, and thus he lost his skill, exterminated his game, and sacrificed his independence.

What made the lean and hungry fox think his lot better than that of the pampered house-dog was the collar-mark on the dog's neck. That which was dearest to the Indian in his rugged life was its entire freedom. From infancy he was subject to almost no authority, either of parent or chieftain. Where there was little property and entire liberty of secession from the band, the control of a chief was of necessity small. The men and women of the tribe were rather managed than governed by their head men. The execution of penalties was left almost always to private revenge; quarrels were settled without the intervention of authority, unless a dispute threatened the integrity of the band, in which case it was taken in hand and managed by the craft of the chief and the council. If a member of the tribe was troublesome, and his death regarded as desirable for public reasons, suggestions were adroitly thrown out that he was a worker of evil charms, and all the ills that happened in the village came thenceforth to be attributed to his malice and magic; he was at length put to death in obedience to a popular clamor, while the chief men who had purposed his destruction did not appear in the matter. In rare cases of sedition or witchcraft, the council appointed executioners to stab the offender.

It is related that once, among the Hurons of Canada, a public execution was deemed needful under the following circumstances: A man had "cast away" his wife, but she went in the annual hunting-party, accompanied by her brothers. Perceiving by accident that her husband, who was of the party, was watching her, she warned her brothers, and, with the youngest of them, concealed herself at night in a tree near their lodge, where she was witness to a struggle in which the rest of her brothers were slain by her husband and his friends. The woman, after many narrow escapes, contrived to reach the village first, where she related the occurrence to her own family, and then to the council, giving for assurance of the truth of her story the statement that one of the assailants had been badly bitten in the hand. It was not thought best to leave so flagrant a crime to be avenged by a family several of whose warriors had been killed at a blow. A feast was therefore prepared in the council-house in honor of the returning party, who, besides having good luck, were laden with the spoils of the slain. The hunters related their adventures to the guests, as the manner is at such times, and told, with apparent grief, of the irruption of enemies who had cut off those that were missing. The man with a bandaged hand said that a beaver had bitten him. Then, from their concealment behind a mat, were suddenly brought forth the woman and the youth to confront the assassins with the story of their crime. When this circumstantial accusation was finished, young men who had been placed next to the criminals, stabbed them to death, the murderers submitting to their fate without complaint or resistance, after the manner of an Indian doomed by his own tribe.

Under the system of private retaliation for private offenses, and of tribal vengeance for public or foreign ones, the hideous passion of inveterate revenge took the place of patriotism and religion in the brain of the Indian.

It was the pride of an injured man to dissemble, but never to forget — wreaking vengeance long years after the offense. Out of this insatiable lust for revenge came the ever-recurring and almost unintermitting warfare between tribes. Battle was, indeed, a necessary pastime for idle young braves, and peace was irksome, so that war was often sought merely for the sake of excitement, and for the opportunity it gave of acquiring distinction. It was this passion for revenge, uplifted to a patriotic and pious duty, that brought about the cruelty to prisoners which makes the history of Indian wars one long horror of human perdition. In every village through which the captive passed, tortures of one kind or another were inflicted by men, women, and children, who thus consoled themselves for the loss of friends. Sometimes it was the gauntlet, sometimes a widow would solace her spirit by cutting off a joint of a finger, or biting out a nail. If the prisoner did not chance to be adopted as a slave into some cabin, in place of a dead member, he was at last "cast into the fire," under which phrase there lurked the indescribable tortures which were inflicted for dreary hours upon the defiant victim. In some tribes these torture-scenes were conducted by the women. The eating of the flesh of victims burned at the stake seems to have grown out of a desire to wreak a final and ferocious vengeance on his body, though there were warriors who boasted a great relish for human flesh. In war-time, the northern tribesmen were accustomed to "subsist on the enemy" in a literal way. Denonville, Governor of Canada, having vanquished the Senecas in 1687, was horrified at seeing twenty-five of the latter, who had been killed in battle, quartered, boiled, and devoured by his Ottawa allies; and six years later, the New York commander, Major Peter Schuyler, was not pleased to find a Frenchman's hand in the soup served to him in the camp of his Iroquois soldiers.

In war, as at home, the Indian refused discipline, following the leader whom he trusted, and returning home whenever he became discontented with the conduct of the expedition. But, despite his lawlessness and idleness, his freedom was checked on many sides by the unseen bands of traditional custom and tyrannical public sentiment. What he must do in certain contingencies was firmly prescribed for him by the immemorial usage of his race, and it was rare that any Indian was strong enough to break through this chain. Trammeled even in small matters by fixed customs and an intricate etiquette, as well as by superstitions innumerable, he never submitted to any despotism besides. Attempts of white men to enslave Indians were generally fatal to the savages, who were as unwonted to such restraints as other creatures of the wilderness.

Excitement of some kind was indispensable to relieve the tedium of the idleness in which a great part of savage life was spent. The intervals between hunting and war-parties were filled up by an inconceivable number of ungraceful dances of various kinds, all regulated by a rather complicated etiquette, many mixed with superstition, and some ending in debauch. There were feasts of many sorts, at which those not invited might crowd the door-ways as spectators, or strip off the bark sides of the cabins to see the ceremonies; and there were athletic games, and games of hazard, with dice of bones or cherry-stones, in which the excited players would often lose all their possessions, not sparing to wager their wives; the reckless gamester sometimes even staked his own liberty, and became a slave to the winner until his friends could redeem him. Sometimes the lucky arrival of prisoners in transit, who could be beaten as they ran the gauntlet, furnished diversion, and on grand occasions the savage could repair to the council-house as to a theater, to see the long-drawn torture of a captive — a sight as well suited to his taste as bull-fighting to a Spaniard's, or bear-baiting and cock-fighting to that of our English ancestors.

IV.

OBSTACLES TO CIVILIZATION AMONG THE INDIANS.

ATTEMPTS were made in every colony to civilize the Indians, but to these their immemorial and inflexible customs offered in many cases an insuperable barrier. Not only the natural indolence and ferocity of the individual, but the whole economic system of the American tribes tended to promote a barbarous unthrift. All the rewards which civilized life gives to industry and frugality were lacking. The family who had prudently grown a larger supply of corn than its neighbor was compelled by custom to share with those less provident. The inflexible law of savage hospitality assured to the idler a subsistence in the wigwams of his neighbors, and impaired the sense of property. In some of the tribes, at least, the estate of a man deceased was divided by his relatives without regard to his widow and children, who by prescription belonged to another cabin and another "totem," and were not accounted of his kindred in such sense as to inherit his goods.

The wife's property, likewise, did not belong in any case to the husband.

Deep-seated hereditary savagery, which regales itself with torture and cannibalism, cannot be removed in one generation; and before time could be given for permanent results of missionary efforts, the savages were effaced or swallowed up by civilization. The Indian mind was involved in a complicated mass of superstition which rendered the adoption of a new religion difficult. Fetichism, mixed with abject dread of invisible demons that must be appeased, an incredible reverence for dreams, and a perpetual fear of witchcraft, were the things that stood for religion among them. Some tribes had images that were used for charms, and the veneration of these rose occasionally into something like idolatry. The Indians threw tobacco to the spirit supposed to inhabit water-falls and whirlpools, and among the Iroquois the torturing and eating of their enemies partook of the nature of human sacrifice to the demon Aireskoui. There were in some tribes conjurations addressed to inferior animals and other objects of reverence. Fire,—which cooked food when pleased and consumed the cabin when angry,—the sun, the four winds, and all things that were "subtle, crafty, and beyond human power," were supernatural. The powwows or seers, who seem to have wrought themselves into trances, and to have added to these much of juggling imposture, maintained a great ascendency over the common people. It was they who, with dancing, contortion, shaking rattles, and howling, exorcised the spirit that caused sickness, often with mysterious passes drawing visibly with their teeth from various parts of the patient's body bits of hair and bone which had been inserted by witchcraft, to the no small damage of the sick man's health. Under their direction the tribes held prolonged huggermuggerings, in dry seasons, to bring rain upon the fainting fields of maize.

Superstition settled many questions of war and of tribal policy. A band of Indians emigrated in a body from the Minnisink region, to avoid a malign genius of the place. A party of Senecas chased a young Catawba warrior for five miles. He succeeded in killing seven of them before they captured him. The next day, when he was led out to the torture, he escaped by a sudden dash, leaped into the river amid a shower of bullets, and swam under water like an otter, only rising to take breath. On the opposite bank he made insulting gestures at his enemies, and fled away. Of those who pursued him, he slew a party of five while they slept, mangled and scalped them, and then returning in the night, dug up and scalped the seven whom he had slain at first. A solemn council of his foes decided that he must be a wizard, and that pursuit would therefore be useless.

Many were the stories of the transformation of wizards told by the Indian fires; in such tales consisted much of their folk-lore. There was one of a village whose chief men died of a plague, "once upon a time." The conjuring medicine-men knew well that the bird of death which flapped its wings and uttered its cries every night over the cabins of those doomed to destruction could be none other than a transformed wizard, but all their arts availed nothing. At last a deputation from the doomed village visited the lodge of The-Man-With-Very-Long-Hair—a hermit of the wilderness—to implore assistance. He made them some charmed arrows. With one of these they wounded the fatal bird. The next day a young man living in a poor wigwam with his mother was reported to be very ill. Some of the elders visited him, and found, as they expected, the magical arrow sticking in his flesh; under pretense of withdrawing it, they gave it such a thrust as to kill him.

Whatever a man dreamed of must be given him at all hazards to save him from fatal calamity. In one instance a wife was surrendered to a dreamer; in another a slave was killed and cooked for one; in yet another, where the sleeper had dreamed of capture and torture, he persuaded his friends to mimic capture and subject him to a considerable torture, to prevent his falling into the hands of his enemies. Designing men often used dreams to procure what they coveted, and there are amusing stories of retorts in kind on such dreamers.

A trade in charms was carried on in some, if not in all, the tribes. Old men no longer able to hunt either set up for doctors, or manufactured and sold a "beson"—that is, a medicine which, taken internally with exact and appropriate ceremonies, would give luck to the hunter. All of their medicines were administered with precise ceremonies necessary to their efficacy, and the greater part of Indian medical practice was the sheerest imposture and howling nonsense. They knew the value of certain simples of the country, they were skillful in dressing wounds; and the "sweating-house," in which they were accustomed to parboil themselves, after the manner of a Russian vapor-bath, was serviceable for cleanliness, if not for cures.

A serious obstacle to the civilizing influence of the missionary among the Indians was the wide difference between the moral standards and social conventions of the white race

and the red. Falsehood and craft were as much esteemed among the American savages as among those of Lacedæmon; perfidy and cruel treachery were matters for public boast in a war-dance. Chastity, as such, was held in no repute. The wife must be faithful to her husband while she remained with him, and he might punish her infidelity on detection, or he might beat her paramour cruelly,—even to death, if he chose; but if the woman's unchastity were with the husband's consent, there was no odium attached to it. In most of the tribes polygamy was allowed; in all the man might "throw away" his wife when he chose, and she was equally free to leave him. Marriages for a limited time, and alliances on probation with a view to marriage, were often contracted. In the unmarried women unchastity was common and unreproved in all the tribes. In many tribes the chiefship was prudently made hereditary through the female line. The sentiment of purity did not exist among American savages, the property sense was feeble, and human life was held very cheap—the payment of a few belts of wampum being sufficient, in many cases of homicide, to take the hatchet out of the head of the slain, to bury him decently, and to wipe the tears from the eyes of his kindred,—in the words of the ceremony with which the shell-money was presented.

The Indian notions of morality were the outgrowth of Indian life. To the state of the savage his code of social conventions was appropriate; the white man's moral standard would have been inapplicable and impossible to him, so long as he remained a wandering hunter and fisherman, and a guerilla soldier. Hence, it was seen by such philanthropists as Eliot that tillage and fixed dwellings must precede the advent of a new religion and a new code of law.

V.

MISSIONARY AND OTHER PHILANTHROPIC EXPERIMENTS.

THE French Jesuits who entered by way of Canada were the first to propagate Christianity among the Indians within the limits of the thirteen original States. The French of every class, indeed, succeeded better in insinuating themselves into the favor of the savages than the English. The Frenchman was the quicker-witted, more alert, flexible, good-humored, and adventurous; by these traits and his suavity, he was far better qualified to ingratiate himself with his antipodes, than the cooler, stiffer, and more regularly moral Englishman. The eager and undaunted zeal of the Jesuit, that shrank from no peril or hardship, was pressed forward by a discipline much more austere than a military régime—a discipline enforced by the rewards and penalties of eternity. Miracles are always wrought by this sort of devoted enthusiasm; it made Brébœuf patient and defiant amidst the hellish tortures of the Iroquois; it sent the irrepressible Marquette from one untamed tribe to another, in the great unknown valley, until he sank and died on the remote shores of Lake Michigan; and it carried the already maimed Father Jogues, in obedience to the hard orders of his superiors, back to the cruel Iroquois, certain of death, and shrinking in every nerve from the probable infliction of such torture as he had seen others suffer. There is a whole world of pathos in Jogues' brave, half-despairing words, "*Ibo et non redibo*—I shall go, and not come back."

The Jesuit worship and teaching was more easily propagated than the dogmatic, inflexible and naked system of the Puritan, or the more formal but not imposing worship of the English Church. The Amalingans whom Father Rale baptized almost in a body were first impressed with the superiority of Christianity by their deputies having seen the procession of the consecrated host conducted with much pomp and with something like magnificence in a village of the Abnakis. Rale knew well how to take advantage of a barbarian's susceptibility to display. Skillful in the art of turning wood, and knowing something of painting, he labored with his own hands to render his church in the wilderness of Maine imposing. This externalism gave Catholicism a great advantage on all sides. The medicine-men were natural rivals and enemies of the "black-robes," who preached against their powwowing, but, on the plan of keeping

on the safe side, even they were willing that their children should get whatever benefit there might be in the mysterious, and, to them, magical rite of baptism. "In this consists the best fruits which our mission at first receives," writes one of the Fathers, "and which is the most certain; for, among the great number of infants whom we baptize, not a year passes but many die before they are able to use their reason." One of the Jesuits told the captive minister of Deerfield that he always charged the Indians, when they went against the English settlements, to baptize the children before killing them. This doctrine of the benefit of the exact observance of sacraments and other ceremonials was entirely comprehensible to the Indian's mind, and was in the line of his habitual thinking. It was not needful to exact an advanced civilization; the Catholic Church was able to bend itself to the state of the wild man, and to arouse in him the profoundest enthusiasms of which his nature was capable. Voluntary fasts of the severest sort were common among the Indians, on arrival at manhood, in mourning for the dead, and to procure good luck in hunting; the austerities recommended by the Church were therefore readily received, and the stern savage nature felt their fascination. At the Canadian Mission of St. Xavier, Indian neophytes used flagellations unto blood, and belts lined with points of iron. The amiable Mohawk fanatic, Catherine Tehgahkouita, who is called the Iroquois saint, and at whose tomb French as well as Indian devotees were healed of divers sicknesses, carried her austerities to such an extreme as to purchase sanctity with her life.

When the Mohawks captured some of the converts whose religion had brought them into alliance with Canada, the new Catholics had an opportunity to display that fortitude which is in the very fiber of the Indian, by suffering the torments skillfully inflicted by their own tribesmen. These martyrdoms inflamed the zeal of the neophytes, and increased the luster of the new faith in the eyes of the savages.

The Jesuit fathers had frequent cause to complain of the stumbling-block which the lax moral code of the Indians put in their way. The devout Father Jogues recoiled with horror from what he could not help seeing while a captive in the tents of the Mohawks, fearing that his own soul might suffer contamination. The teaching of the Church that a man should have but one wife, and that marriage was not to be dissolved, was a saying hard to be received by savages. Permanent marriage is indispensable to a high civilization, but its necessity is not felt among a barbarous people, where property is not accumulated, where the wife carries the chief burden of the family in any case, and where the domestic affections have not yet passed from brute feeling into human sentiment. Virtues common enough in a regular and industrious society are not easily preserved in the idle, wandering, and promiscuous life of the wigwam.

The patient heroism of the French Jesuits must always excite admiration, but their labors for the Indian race have produced no larger or more enduring result than those of others who have spent themselves in the attempt to elevate the American savages. From the first, the English adventurers to America, having no conception of the difficulty of changing the leopard's spots, proposed to make their colonies a means of propagating the faith among the Indians. Captain John Smith was censured because he had not already wrought the conversion of the heathen, in the first two years of storm and stress, while all his endeavors were directed to cajoling or frightening the savages into giving him corn enough to keep his cadaverous company alive. The conversion of the "Princess" Pocahontas was believed to be the coming-in of the first-fruits of the tribes; but the young Indians sent to England only learned the vices of Englishmen. One of the first clergymen in Virginia, Jonas Stockam, losing patience, proposed that the throats of their "priests and ancients" should

FROM THE DRAWING MADE IN RALEGH'S COLONY, IN 1585, BY JOHN WHITE. (BY PERMISSION OF THE BRITISH MUSEUM.)

be cut, as a necessary preliminary to the conversion of the aborigines; and even the geographer Hakluyt said that "if gentle dealing will not serve," there were "hammerers and rough masons enough,—I mean our old soldiers trained up in the Netherlands,—to square and prepare them to our preachers' hands." Force being a favorite means of grace for Papists and Puritans at that time, minating the Indians took the place of the desire for their conversion. Toward the close of the seventeenth century, and in the early years of the eighteenth, the experiment of giving a liberal training to Indian youth was tried for many years in the College of William and Mary, in which a professorship for their benefit was founded by a legacy of the famous Robert Boyle, and Governor Spots-

A DANCE OF THE CAROLINA INDIANS. (FROM JOHN WHITE'S ORIGINAL, IN THE GRENVILLE COLLECTION OF THE BRITISH MUSEUM.)

it was naturally thought a wholesome thing for heathen savages. One of the earliest projectors of the Virginia colony spoke more softly, and urged that the Spanish example should not be imitated, but that the savages should be converted "by faire and loving means suiting to our English natures, like that soft and gentle voice wherein the Lord appeared to Elias." Collections were made in the churches in England to found a college at Henrico for the purpose of "educating infidel children in the true knowledge of God." Ten thousand acres of land were set apart for this school, and an amiable and enthusiastic gentleman — Mr. Thorpe — took charge of its affairs. But upon the beginning of Indian horrors in 1622, Thorpe himself was killed, the colony was driven to the verge of ruin, and the passion for exterwood established at his own expense an Indian school among the Saponies, where, about 1720, as many as seventy-seven children were under the teaching of the excellent Charles Griffin. But the Indian students at William and Mary died from uncongenial surroundings, or relapsed into savagery, and Spotswood's school had no other result than that of making the Saponies a little more cleanly than other Indians.

Missionary efforts were also made by the English Jesuits, who came over with Governor Calvert, at the planting of Maryland, in 1634. Here, first, perhaps, in an English colony, translations were made into an Indian dialect for purposes of conversion. Nothing could be more romantic than the wilderness voyages on the waters of the Potomac and its tributaries, such as were frequently made in a little

ROBERT BOYLE. (AFTER A PRINT FROM A PAINTING IN POSSESSION OF LORD DOVER.)

boat by one or another of these fathers, accompanied by an interpreter and a servant. A chest containing bread and butter, a little green-dried maize, some beans, and a little flour, was the store of supplies in case night should overtake them far from the hospitality of wigwam or cabin. In another chest were a bottle of wine for the Eucharist, and six bottles of holy water for baptisms. There was a casket containing sacred utensils, and a small table for an altar. Another casket was filled with little bells, combs, fish-hooks, needles, thread, and other such things "to conciliate the affection" of the Indians. One can imagine the impression made upon the savage mind by the unpacking of these bottles of consecrated wine and holy water, and the setting out of the little table and the mysterious sacred utensils. When at length Father White cured some dangerous wounds by the application of the cross to them, there could be no longer a doubt of the superior efficacy of the new religion. Similar cures through religious agencies were starting-points with some of the New England missions. But in the course of years Indian wars, and the consequent removal and destruction of the Maryland tribes, obliterated every vestige of the work of these Jesuit missionaries.

Two curious devices for taming the Indians by degrees were tried in Maryland and Virginia. In 1651, Lord Baltimore proposed to settle six bands on a tract of land with copyhold estate, and the machinery of a feudal manor. In 1655, Virginia tried the plan of giving them a cow for every eight wolves' heads, but the Indians neglected to milk the cows in summer and allowed them to starve in winter. Nearly a hundred years later the Abbé Picquet tried to establish pastoral habits in the Indians at Ogdensburg.

Soon after Father White had translated a

FROM THE ORIGINAL DRAWING MADE BY JOHN WHITE IN 1585.

catechism into the speech of the Piscataways on the Potomac, John Campanius, a Lutheran minister, in New Sweden, rendered the Lutheran catechism into the cognate dialect of the Lenni Lennape, the Indians of the Delaware. It was not only translated, but adapted to the savage understanding: "Give us this day a plentiful supply of corn and venison," was one of the petitions in the Lord's Prayer, as rendered by Campanius; to this the heart of a savage would be sure to respond. The French Jesuits took similar liberties when they represented, in the Iroquois, that the soil of heaven yields corn, beans, and pumpkins, without the trouble of tillage. The return of Campanius to Europe, and the overthrow of New Sweden by the Dutch, put an end to this mission. But half a century after Campanius we find the catechism printed for the first time, and put in use for the instruction of the Indians.

About the time that Campanius began to learn the language of the Delawares, a similar impulse moved Megapolensis, a Dutch clergyman at Albany, to attack the "heavy language" of the Mohawks. At a later period other Dutch ministers made similar endeavors. Nowhere are the vanities and vices of the savage set down more vivaciously than in a racy letter of "Dominie" Megapolensis. The children, he tells us, went "mother-naked" until they were ten, twelve, or fourteen years of age, and the adults were almost naked in summer. They wore shoes of buckskin or corn-husks, and had a streak of short hair in the middle of the head, "like hog's bristles." When one of them had bought half an ell of duffel cloth, he hung it loosely about him, "without sewing, just as torn off, and, as they go away, they look very much at themselves, and think they are very fine." The energy of the French Catholic and of the New England Puritan missionaries was foreign to the temper of the Dutch Calvinists; but the churches of Albany succeeded, from time to time, in bringing a number of the Indians to Christianity. The Dutch dominies found it a discouraging work, however, as well among the Indians on the sea-coast as among the Mohawks about Albany. In 1657 Megapolensis, then at New Amsterdam, and his colleague, wrote to Holland that the Indian whom they had had under instruction to teach his people, and who had learned to read and write good Dutch and had made a public profession of faith, had of late taken to drinking brandy, had pawned his Bible, and had "become a real beast." This was the end of similar beginnings in many places.

It was, however, in the colonies of Massachusetts and Plymouth, and on the island of Martha's Vineyard, that the most persistent and successful attempts were made in colonial times to assimilate the Indian's modes of living and thinking to that of the white man. There was a force and tenacity in

Puritanism that rivaled in effectiveness the enthusiasm and discipline of the Jesuits, and when once the energies of the New England divines were directed to the Christianizing and civilizing of pagans, some result was sure to follow. Though the work was attempted by Roger Williams in Rhode Island and was begun successfully by the Mayhews, father and son, on Martha's Vineyard, it found its chief agent in John Eliot, the famous "apostle to the Indians," whose courage, sagacity, and self-denial are the highest glory of early New England Puritanism. The lapse of time, which dims the fame of the eloquence of Cotton and Hooker, and the advance of thought, which makes the debates of the great synod of Cambridge puerile nonsense and the learning of Norton and the Mathers of little account, only increase the luster of the Roxbury preacher. His patient devotion made the wilderness of barbarism to blossom with Indian villages governed by law and striving after regular morality, while his example infused a more humane spirit into the rigorous Puritanism of his time. He remembered that such work must be slow, and chose for his motto: *Ab extremo ad extremum nisi per media.* He had the supreme condescension of strong goodness to the infirmities begotten of savagery and vice. He entertained no false notions of savage character, but felt the hideousness of human barbarism; he even calls the Indians "the dregs of mankind." He stooped to win their affections by means suited to their childishness: at the close of his first public interview he gave apples to the children and tobacco to the men. When they wept, he shed tears; his heart was like a mother's to them. The first prayer he was able to utter in their tongue touched their stolid natures profoundly. They would sometimes lie awake all night from the excitement caused by his sympathetic discourses. It is impossible, even now, to read without emotion his narrative of the awakening of conscience in some of the Indians, of the confession of faults, and the tearful reconciliation of domestic quarrels.

FROM THE ORIGINAL DRAWING MADE BY JOHN WHITE IN 1585.

Their minds, not inured to the hardy speculations of theology, received Eliot's system with difficulty. They asked him what would become of the soul of a man if he were cased in iron a foot thick, and cast into the fire. They wished to know why God did not kill the devil, and have done with him. But he chiefly won them by his appeals to a commonplace sense of right and wrong, and to their domestic feelings. He persuaded the tyrannical husband to make public and contrite confession of wife-beating, and he reconciled the unruly son and unkind father by bringing them to mutual confessions and forgiveness in the presence of their neighbors. By seeking the Indians at their great fishing resorts, by accepting the rude conditions of their life, by hardihood under exposure, and by coolness in peril, he won their esteem.

Eliot had need of his motto, for his converts began their new life at a very low point, as the early laws which they instituted for their own reformation bear witness. They

JOHN ELIOT (BY PERMISSION, FROM A PORTRAIT IN POSSESSION OF THE FAMILY OF THE LATE WILLIAM WHITING, ESQ.)

imposed penalties on idleness, lewdness, long hair in men and short hair in women, sponging on one's neighbors, scantiness of apparel in women. Later there were rules against powwowing, lying, stealing, polygamy, quarreling, pride, Sabbath-breaking, greasing one's self, and certain other offenses that are better left unnamed. These are the blue laws of the aborigines. By degrees many of the Indians were reduced to some order, though they never became industrious, and were liable to many lapses into savagery. General Gookin, the agent of the Massachusetts General Court, was Eliot's principal assistant in the civil part of his work. There was much opposition from the medicine-men, and a more dangerous antagonism was stirred up by the jealousy of the chiefs. Mockery was added to intimidation. Two lads from the Christian village were jeeringly nicknamed respectively Jehovah and Jesus. One of the chiefs on Martha's Vineyard, for "walking with the English," was wounded by an assassin sent from the mainland. One cannot but regret the waste of time and effort in Eliot's translation of the whole Bible into a dialect spoken by a few thousand people, and destined to pass swiftly out of use. He also spent breath in giving lectures to Indian teachers on "logic and theology," after the manner of the times, and in 1672 printed a thousand "logic primers" in their language. Money was freely given in England by Robert Boyle and others; much of it was expended in New England in trying to educate Indians in Harvard College, for the ministry. Aside from the inherent folly of giving classical or scholastic instruction to an Indian preacher, the Indian youth were not fitted by nature to receive a liberal education, and the change in their hereditary

habits aggravated their natural tendency to pulmonary disease, so that this part of the experiment was an entire failure—the only Indian graduate died at twenty years of age, and, failing students, the "Indian College" building was turned into a printing-office. But the most trying part of Eliot's experience must have come from the instability of many of his converts. Some of the most prominent relapsed into barbarism and vice, and some engaged in Philip's massacres. Among these was the Indian printer who had helped Eliot in issuing the Bible. Yet those of his converts who took part with Philip in the massacres scrupled much as to whether they might eat horse-flesh in case of necessity.

We must not, however, estimate at too low a rate the results of the labors of the apostle and those associated with him. Just before the outbreak of Philip's massacres, when the missionary work was at its best, there were about four thousand in the villages of the "praying Indians," on Martha's Vineyard, Cape Cod, and about Boston, chiefly among sedentary fishing tribes, and those living intermingled with the settlers. Missionary labor was never very successful in a dominant tribe.

In the hurricane of popular resentment which broke forth after the outbreak of the massacre under Philip, Eliot and Gookin had need of all their courage and address to preserve the faithful praying Indians from the wrath of the white man. The apostle's former popularity in these times turned into something like odium, but his courage and devotion increased with the distress of his people, who were shut up on one of the islands in Boston harbor for safety until they were at last permitted to fight against Philip. After the tempest subsided, it came to pass, by the labor of those who succeeded Eliot, that all of the New England Indians who survived the wars, the diseases, and the vices introduced by Europeans, were brought, to a greater or less extent, under the influence of Christianity and law. But a regular life has always proved not only irksome, but unwholesome, to the Indian. Caucasians have been acclimated to civilization only by the slow advance of centuries. A rapid reduction to a civilized state is a passage from extreme to extreme, without the intervening mean. The moral and economic improvement wrought in the condition of the Indians in New England and on Long Island has produced a gradual and almost total extinction of the red race; the white man's virtues are nearly as fatal to the Indian as his vices.

It is not my purpose to trace here the history of Indian missions, except in so far as it illuminates some traits of colonial life, and the character and fate of the aboriginal race. The politico-religious mission of the English Church among the Iroquois belongs to the history of the conflict between the English and French colonies. The later and partly successful missions of the Congregationalists and Scotch Presbyterians were the overflow of the great Whitefieldian revival, and their history belongs to the account of that movement. The discouragement attending all these efforts is well expressed in the confession of the veteran missionary, John Brainerd, at the close of the colonial epoch: "There is too much truth in the common saying, 'Indians will be Indians.'"

But it would be a mistake not to mention here the quaintly picturesque mission of the Moravian brotherhood, which began in 1739, at Shokomeko, on the borders of New York and Connecticut, and spread to many tribes, so that the voices of the German brethren were heard in the valley of the Ohio long before the Revolution. Never was there a more single-hearted religious enthusiasm than that of the Moravian missionaries, dwelling often in wigwams remote from human fellowship, and in frequent perils, winning the savages by incredible affection, and recalling them from their disheartening lapses into barbarism by a long-suffering patience that knew no exhaustion. The communal organization of the Moravians gave them an isolation from worldly interest, and a discipline as effective as that of the Jesuits, while the gentle simplicity of their manners and the intensity of their religious faith fitted them for a work of reformation among savages. They did not escape the fatality attending all Indian missions. Though they held a peaceful position aloof from the conflicts between France and England, Royalists and Continentals, which agitated even the wilderness, yet they were often ground between the millstones. The ignorant settlers about their first mission accounted them French Jesuits in disguise, and the meek brethren endured the most shameful persecutions from the authorities in New York, who were unwilling that a drunken Indian should be brought to decency without the Governor's license. They suffered much from hostile Indians, and more from barbarous frontiermen; nearly a hundred of their converts—men, women, and children—were massacred by white men at Gnadenhutten in 1782.

There is one indirect and unexpected result of religious propagandism among the natives. The old religion in some of the pagan tribes has suffered a change. The Great Spirit, chief of all the gods and demons,—hardly, if at all, known to their thought before,—has come

into prominence. Their festivals and superstitious observances are now marked by something more entitled to be called worship than were their old incantations. The religious ideas disseminated among them in the later colonial time affected the teachings of the Indian prophets, who arose after the Revolution in great numbers. Such was the great Ganeodiyo, the Iroquois reformer, brother of the famous chief, Cornplanter. After a life of dissipation, Ganeodiyo fell into a trance and saw visions sent by the Great Spirit. He devoted the last sixteen years of his life to reforming the ancient religion and setting to rights the morals of his fellow-tribesmen. All of the unchristianized Iroquois received his message, and after his time the decrease of their numbers through intemperance ceased. One curious effect of his religious teaching has been a sort of apotheosis of Washington; for though no white man can ever enter the kingdom of heaven, yet George Washington, the magnanimous friend of the Six Nations, abides in luxury, solitude and silence, in a house fast by the very door of Paradise, where every good Indian, on his way to bliss, is permitted to look in and see him. Similar though less dominant prophets arose among the Delawares, one of whom supported Pontiac's hostilities; and of the same kind was the Shawnee prophet, Tenskwatawa, the brother of Tecumseh, who strongly influenced the Indians of Ohio and Indiana, in the beginning of this century, and such perhaps were the prophets among the Creeks. These reformers adopted the old superstitions, customs, and festivals, but seem to have given them a somewhat deeper significance. To the amorphous superstitions of the savages they added certain notions that were, no doubt, received from the missionaries, such as that of a supreme deity, and that of reward and penalty in a future life. All, or nearly all of them, made abstinence from strong drink a prominent article in their moral code, and denounced witches and sorcery; and all of them set their faces against the influence of the white man, of which they were themselves the unconscious offspring.

Speculation on the possibilities of development in the Indian race must always be rather void of result. In Mexico and Peru two of its branches had attained a considerable civilization, a ponderous architecture, a grotesque and colossal sculpture, and a hieroglyphic system of writing. Within the bounds of the thirteen colonies, the Creeks or Muscogees had come to plant extensively, to build log-houses with a roof of thatch, to do some rude wood-carving, to sculpture elaborate tobacco-pipes of stone, and to weave with a rude threddle. The Hurons, before the earliest period of European settlement, carried on an intermediary commerce with other tribes; the Tuscaroras made maple bowls and ladles for sale to other Indians. The powerful Muscogee Confederacy at the South, and that of the Iroquois Five Nations at the North, were triumphs of savage statecraft, and had apparently set out on that tedious and bloody path to civilization trodden for ages by the European races. The superiority of the Iroquois to the Algonkin tribes has been exaggerated; but the former certainly had more convenient houses, a larger dependence on agriculture, superior craft and enterprise in attack, a better foresight and skill in fortification, and were able to transmit from one generation to another a stronger national cohesion than that of the tribes about them. They had emerged from the state in which petty clans are mutually repellant, like the molecules of gases; a very slow process of condensation was probably going on, and the far-reaching conquests and fierce extermination of foes by the Five Nations tend to show that the awful law of selection by survival of the strongest, the most compactly organized, and the most ingenious and energetic, was at work in the tribal warfare of America. On the other hand, the remains of ancient art found in the mounds of the Mississippi Valley, and the massive earth-works of the same region, indicate that the Indians in that valley in antiquity were as far advanced in the arts as the more recent tribes, and that they were as compactly and extensively organized, and were possibly more agricultural than any of the modern tribes north of Mexico. Development in art and organization would seem to be always a result of the necessities growing out of an increasing density of population, but the population of the tribes in the colonies was apparently stationary. Incessant war, frequent want, occasional pestilence, and the destruction of unborn offspring caused the increase, if there was any, to be very small. Whether in some far distant future a civilization might have been evolved comparable to that achieved on the Eastern continent, cannot now be conjectured; the arrival of Europeans put an end to the experiment. There is abundant compensation for the temporary evils that followed the contact of the two races, in that eons of massacre and torture horrible to contemplate have been spared by the introduction of a civilization already somewhat advanced and necessarily dominant over and exclusive of the primitive barbarism.

A WOMAN'S REASON.*

BY W. D. HOWELLS,

Author of "Venetian Life," "A Chance Acquaintance," "A Modern Instance," etc.

VIII.

THE walk from the post-office to West Pomegranate street is not very short, but Helen was at the Miss Amys' door before she knew. The elder Miss Amy came herself to answer the bell. She recognized Helen presently through her veil, and welcomed her with a decayed-gentlewoman politeness, explaining that she and her sister kept no servant when their lodgers were out of town. Helen had begun to say, after the preliminary parley about health and the weather, that she had come to see if she could take board with them, when the younger Miss Amy came in. She shook her head in response to the elder Miss Amy's reference of the matter to her, and said she was sorry, but it was a mistake: they only let their rooms furnished now, and people must find table-board at some of the neighboring houses. At Helen's look of disappointment, she said she knew it was very disagreeable going out to meals; but their lodgers were nearly always gentlemen, and they did not mind it.

"Is the lady who wishes the rooms a young person?" asked Miss Amy.

Helen saw that they thought she was looking up a place for some one else, and that they were far from imagining her errand to be on her own behalf. They saw in her an amiable young lady, interesting herself for some one who was out of town perhaps, and wished to come in for the winter. It cost Helen more to set them right than she could have believed; the first steps downward in the world are not so painful from the surprise of your equals as from that of people on the level to which you descend.

"It's for myself that I want the room," said Helen; and both the Miss Amys said "Oh!" and then were silent, till Helen asked if they could recommend her to some good place where she could find both board and lodging under the same roof. The Miss Amys thought a while. All the neighboring places were very large boarding-houses, and the company very promiscuous.

"I don't think you would like it, Miss Harkness," said the younger Miss Amy.

"I'm afraid it isn't a question of what I shall like, any more," said Helen, bravely. "It's necessary that I should economize, and if I can get a room there cheaply, I must not be fastidious."

"Oh!" said the younger Miss Amy, a little more expressively than before.

"Still," continued the young girl, "I *should* like it better if I could find some place where there were not *many* other boarders."

The elder Miss Amy looked at the younger with a blankness for which the glare of her spectacles was mainly responsible, and asked:

"How would Mrs. Hewitt's do?"

"Mrs. Hewitt's might do," assented the younger sister. "Her rooms are good, and the Smileys liked her table. But Miss Harkness would find it very different from what she's been used to."

She seemed to add this caution with a certain indefinable insinuation that the change might be a useful lesson.

"Oh, no doubt," said Helen, "but I shall not mind, if ——"

"It's quite a proper place in every way," continued the younger Miss Amy, "and the neighborhood unexceptionable. If you can get the use of the parlor to see your friends in, it would be desirable. You won't keep *all* your acquaintance," she added, "but some will remain true. *We* retained all that we wished."

"Yes," said Helen, dryly, not choosing that Miss Amy should assume their equality in that fashion. The Miss Amys had, in fact, declined to their present station from no great social eminence, but the former position had been growing in distinction ever since they lost it, and they had so long been spoken of as "such gentlewomen," that they had come to look back upon it as something quite commanding; and there was a note of warning for Helen in the younger Miss Amy's remark, as if all persons must not expect to be so fortunate as they. "I should like," said the young girl, with some stateliness, "very much to see Mrs. Hewitt. Will you give me her address?"

"I will write it on one of our cards," said Miss Amy, who found with difficulty, in a

* Copyright, 1882, by W. D. Howells. All rights reserved.

portable writing-desk on the table, a card inscribed with *The Misses Amy* in the neat penciling of a professional card-writer. The reception-room of these ladies was respectable in threadbare brussels and green reps; a fire of English cannel coal, in the grate, seemed to have been a long time laid, and the lumps of coal would have been the better for dusting. The house was clean, but it had the dusty smell which small city houses have at the end of summer before their furnace fires are lit, and Helen had found the Miss Amys not such nice Miss Amys as she had thought them in former days, when she had come to their house to call upon some friends there. When the card was inscribed with Mrs. Hewitt's address, she rose to receive it.

She felt strangely depressed, and the tears came into her eyes as she pulled down her veil and hurried away. She had packed a bag before leaving Beverly, with the purpose of not going back that night, for she had not thought but that she should go at once to the Miss Amys, and had resisted all entreaties that she would return and tell the Butlers about it. She would not have gone to the Miss Amys now on any account, and yet she felt somehow hurt at not finding their house open to her in the way she had imagined. She had a cowardly satisfaction in thinking that she could easily get the six-o'clock train to Beverly after she had seen Mrs. Hewitt.

Like the elder Miss Amy, that lady answered her door in person when Helen rang, and taking the card, with the explanation that Helen gave her, led the way to her reception-room. It took shape from the swell-front; and the rocking-chair, into which Mrs. Hewitt sank, stood between the two windows, by which she could easily command the life without, up street and down. What had been the fire-place was occupied by a register; over the mantel hung the faded photograph of an officer in uniform; in the corner was a what-not, with shells and daguerreotypes in cases, and baskets of sewing on its successive shelves; against the wall, opposite the windows, stood a sewing-machine; the carpet was a tapestry of moss pattern in green color; the window-shades had a band of gilt around their edges, relieved in green, and the reps of the sofa and chairs were green. Simple and few as these appointments were, they had an unreconciled look, as if they had not been bought to match, but were fortuitous combinations on which some one else had lost money.

Mrs. Hewitt asked her to sit down, but Helen remained standing, and said that she was a little pressed for time, and must ask at once if she could have a room with board.

"I don't know as I've got anything 'twould suit you, but we can look," said Mrs. Hewitt, apparently disappointed in not being first allowed to talk it all over. "Did you want something *on suit*, or singly?" she asked.

"I don't know what you mean," said Helen.

"Do you want more than one room?"

"Oh, no! I only want one."

The landlady preceded Helen up the stripe of linen that covered half the narrow carpeting on the cramped staircase. "Parlor," she announced on arriving at the first landing, as she threw open the door of a large room furnished in much-worn brown plush, "goes with the rooms on this floor; I always let 'em *on suit*. Now, if you wanted anything *on suit*——"

"I only want one room, and I don't care for a private parlor," said Helen.

The landlady glanced up the next flight of stairs.

"That whole floor is let to one family—lady and gentleman and little boy,—and then there's only a room on the top floor besides," said Mrs. Hewitt.

"I'll look at it, please," said Helen, and followed the landlady up. The room had a pretty bed and bureau; it was very neat, and it was rather spacious. "Is there any one on this floor?" asked Helen, feeling sure that the cook and second girl must be her neighbors.

The landlady pushed open the door across the little passage-way.

"There's an art student in this room," she said.

"Art student?" gasped Helen.

"Young lady from Nashua," said the landlady.

"Oh!" cried Helen, remembering with relief that art students in our time and country are quite as apt to be of one sex as another, and thinking with a smile that she had been surprised not to smell tobacco as soon as Mrs. Hewitt had said "art student." She reflected that she had once been an art student herself, and wondered what the sketches of the young lady from Nashua were like. "What would be the price of this room?"

The landlady leaned against the side of the bed.

"Seven dollars," she said, in an experimental tone. "I used to get my ten and twelve dollars for it, right after the war."

"I will take it," said Helen, who found it much less than she feared. "And I should like to come at once."

"To-night?" asked the landlady, looking at Helen.

"Yes, if the room's ready."

"Oh, the room's *ready*. But—did you bring a trunk?"

"I forgot! It's at the station. I can send for it."

"Oh, yes; the express is right round the corner from here. You just give 'em your check. But you better not lose any time. They're late sometimes, any way."

"Very well," said Helen, childishly pleased at having transacted the business so successfully. "I will take the room from to-day, and I will pay you for the first week now."

"Just as you please," said Mrs. Hewitt.

Helen drew out her porte-monnaie, and said:

"The Miss Amys can tell you about me."

"Oh, that's all right," answered Mrs. Hewitt, politely. She had perhaps been perplexed to know how she should hint anything about references to this young lady who took an attic room with such a high and mighty air. "Their card was sufficient."

When Helen came back from her errand to the express office and went to her room, she laid aside her things and made herself at home in it. She did not know in the least what her life was to be there; but she felt that this, whatever it was not, was escape and independence and beginning. A rapid calculation had shown her that her payment of seven dollars a week would not encroach much upon her capital, and somehow she would earn enough money to meet her other expenses. She could not sit still; she rose and opened her closet, and found it deep and convenient; she pulled out the bureau drawers, and they were very sweet and clean. She discovered a little cupboard with shelves where she thought she would put her books. The room was very complete; there was even a hook in the ceiling by the window where some one must have hung a bird-cage. Helen was happy, without accusing herself, for the first time since her father died. She smiled to herself at her landlady's queerness, and was glad, as young people are, to be housed along with a character. She wondered what Miss Root was like, and who the Evanses could be. At the sound of the tea-bell she felt the emotion of a healthful hunger.

There was a dish of cream toast, very hot and fragrant; hotter, and more fragrant still, there was a dish of oysters, delicately stewed and flavored; in a plated basket in the center of the table was a generous stack of freshly-sliced lady-cake. "From Copeland's," Mrs. Hewitt explained, when she passed it. "Mr. and Mrs. Evans are out to tea, and I thought we wouldn't wait for Miss Root. She's late sometimes. Did you like your oysters?"

"Delicious!" said Helen.

"Yes, I think there's nothing like a drop—not *more* than a drop—of sherry in your stew, just when it comes *to* the stew. I don't believe in any thick'nin' myself; but if you *must* have it, let it be cracker crumbs: flour makes it so kind of slippy." Mrs. Hewitt went on to enlarge upon many different kinds of dishes, and then, from whatever obscure association of ideas, she said: "When you first came in to-day, before I fairly looked at the Miss Amys' card, I thought you'd been buryin' a husband. I don't see how I could took you if you had. Widows are more *trouble* in a house! Boston family?"

"*What?*" cried Helen.

"Your folks Boston people?"

"Oh, yes," replied the girl. And she submitted with what grace she could to the inquisition into her past that followed. "I've never lived anywhere else." And nothing seemed stranger than this when she came to think it over in her room. Here, in the heart of Boston, she was as remote from the Boston she had always known as if it were a thousand miles away; from herself of the time when she lived in that far-off Boston she seemed divided by centuries. Into what a strange and undreamt-of world she had fallen! She did not dislike it. On the contrary, she thought she should be rather content in it. Without definite aims as yet for the future, she fancied that she should try to be wholly of her present world, and ignore that in which she used to live. Already she felt alien to it so far as to wish that the Butlers would not send people to call on her, nor come much themselves. She knew that she could adapt herself to her circumstances, but she dreaded the pain of their inability to realize her in them, and felt that their unhappiness about her would be more than she could bear. She planned a geographical limit within which she could live a long time and not meet any one whom she had known, and she resolved next day to begin her exploration of her solitude. The dark gathered into the room, and the window showed a black frame against the sky before she thought of lighting her gas. She was shaking her match out, as women do, when a light tap at her door standing ajar startled her, and then the door was pushed open, and the figure of a tall girl stood on the threshold.

"Miss Root: Miss Harkness, I believe," said the figure. "Will you lend me a match, please? I waited for you to light your gas, so as to be sure you had matches before I bothered you. It's such a long journey downstairs."

Helen smiled in her most radiant way, and

got the matches, saying, as she held them forward:

"Wont you come in, please?"

"No, I thank you," said Miss Root, taking one match only. "I begin badly. But you wont find me a great borrower. Have you got everything you want in your room?"

"Yes, everything, I believe," said Helen, sweeping it with a comprehensive glance.

"You'll find Mrs. Hewitt pretty prompt. You wont have anything to complain of, unless you mind being talked to death. Good-night," and drawing the door to after her, Miss Root returned to her own room.

Before she slept, Helen heard the street door open and shut, and then voices ascending to the third floor: a lady's voice, and a gentleman's voice, and a sleepy little boy's voice.

"Well, this is the *last* time we shall take Tom to the theater," said the lady's voice—the voice of spent nerves.

"Yes," said the gentleman's voice. "We shall confine ourselves to the circus after this, Tom."

"Circuses are the best, any way," said the child's voice.

"Hush! Don't speak so!" cried the lady.

"Why, they are, mamma," insisted the boy.

"This is a question of morals, not of opinions, Tom," said the father. "You're not to prefer circuses when they're inflicted as a punishment."

They had now reached their door, as it appeared, for a light flashed into the hall below as from gas turned up.

The lady's voice was heard again:

"His forehead's burning hot! If that child should have a fever—— Here, feel his forehead!"

"Forehead's all right!" responded the heavier voice.

"*I* shall give him three of aconite!" cried the lady.

"Give him three thousand, but put him to bed," assented the gentleman.

"*Will* you shut the door?" implored the lady. "Waking the whole house!"

"I haven't refused, my dear," said the gentleman. "Why do you always——"

The door closed, expressively, and not, as Helen fancied, by the gentleman's hand. "The Evanses," she inferred. She fell asleep, wondering if she could indeed be the same girl who had talked that morning to Lord Rainford on the rocks at Beverly.

IX.

HELEN saw the Evanses in going to break fast. They came down-stairs just after her; Mr. Evans leading his boy by his extended forefinger, and Mrs. Evans coming behind, and twitching something about the child's dress into place, as mothers do.

"Mrs. Hewitt," said Mr. Evans, as they sat down at table, "I have been some time in your house, but you must have older friends than I, and I don't understand why the law has honored me as it has."

"I'm sure *I* don't know what you're talkin' about," said Mrs. Hewitt, pouring the coffee.

"Well, I don't myself," returned Mr. Evans, "and I thought I would get you to explain. You don't find yourself unusually infirm of mind, do you?"

"No, I don't," replied Mrs. Hewitt, candidly.

"And you haven't experienced anything like a return of extreme youth?"

"What *is* the man after?" cried Mrs. Hewitt.

"Then why should you be taken care of in any special manner, and why should I, of all people, be called upon to take care of you? Here's a paper," Mr. Evans continued, taking a document from his pocket, "that I found slipped under my door this morning. It makes a personal appeal to me, in the name of the Commonwealth of Massachusetts, to become your trustee. Of course, it's very flattering and all that, but I'd much rather not. You must allow me to resign, Mrs. Hewitt. I never did understand business very well, and——"

"How'd they ever get into this house without my knowing it? That's what *I* should like to find out!" said Mrs. Hewitt, gazing absently at the paper which Mr. Evans had given her.

"What does it mean?" he asked.

"Pshaw!" cried his landlady. "You don't say you never was *trusteed* before? And boarded round as much as you have!"

"Trusteed! Is it so common a thing as to have a participial form? Then I needn't have any scruples about resigning?"

Mrs. Hewitt broke into a laugh.

"Resigning! Bless you, you *can't* resign. There's no such thing."

"Gracious powers! Not resign an office for which I don't feel myself competent——"

"Oh, come, now! you know very well what it is. It's them curtains," said Mrs. Hewitt, pointing to the green-and-gold trimmed shades.

Mr. Evans rose and curiously examined the shades; his boy also slipped down out of his chair, and joined in the inspection.

"Thomas, who gave you leave to quit the table? Come back!" cried Mrs. Evans.

"My dear!" expostulated her husband, "the child very naturally wishes to see what sort of window-shade it is that thrusts an irresignable office of honor and profit upon his father. Look carefully, Tom. Regard the peculiarity of the texture, the uncommon tone of the colors."

"Oh, pshaw, Mr. Evans. You stop!" exclaimed Mrs. Hewitt. "When they sent in their bill, I told 'em it was too much, and I shouldn't pay it. I *didn't* believe they'd really go so far as to trustee me."

"But what *does* it mean, Mrs. Hewitt?" asked Mrs. Evans. "I don't believe Mr. Evans knows any more than the rest of us."

"Why, Mrs. Evans, it means just this: that your husband isn't to pay me any board till this bill is settled; and if he does, he's liable for it himself. I presume they'll be trusteein' all of you. I shall have to pay it now."

"Is that the law?" demanded Mrs. Evans. "It makes one long for a delinquent debtor of one's own. So simple, yet so effective."

"Well, you have it to say," said Mrs. Hewitt, surprisingly little ruffled by the incident, "that you never was trusteed in *my* house before."

"I certainly have that to say," admitted Mr. Evans. "I'm sorry on your account that I can't resign my trusteeship, and I'm sorry on my own that it's such a very sordid affair. I never happened to be appointed to office before, and I was feeling rather proud of the confidence reposed in me."

They all rose from the table together, and Helen went upstairs with the Evanses. She and Mrs. Evans exchanged a few words on the way, and stopped on the first landing to glance into the large parlor. Mr. Evans came after, bestriding his boy, who now had hold of both his forefingers,—like a walking Colossus of Rhodes. He flung open the parlor door, which stood ajar, in Mrs. Hewitt's manner.

"Goes with the rooms on this floor; I always let 'em *on suit;* now, if you wanted anything *on suit*——" He looked at Helen for sympathy, and she laughed.

"Yes, I know," she said.

"Mrs. Hewitt wont like your joking her so much," said his wife.

"She wont know it, if I do it behind her back. And she seems to enjoy it to her face."

"Do you think she liked your coming out about that trusteeing?"

"She didn't mind it. But I have it on my conscience to tell Miss Harkness that Mrs. Hewitt is, for all I know, a very just person —and that I'm surprised she let those shade people get the advantage of her. She has a passion, like all landladies, for single gentlemen. She idealizes them, I am afraid. There haven't been any single gentlemen in the house since we came here, two years ago. We sometimes fancy that her preference is founded upon her experience of Mr. Hewitt as a married gentleman, which was probably unpleasant."

"Is—is she a widow?" Helen ventured to Mrs. Evans.

"Why, not exactly," said Mrs. Evans.

"It's a very neat way of putting it," said Mr. Evans. "She's a widow, Miss Harkness, of the herbaceous variety."

"My dear, she'll *hear* you," cried Mrs. Evans.

"Very well, then; she wont understand me. I'll venture to say Miss Harkness doesn't."

"No, I don't," said Helen, and looked at Mrs. Evans for light.

"Her husband is living, I believe," explained Mrs. Evans, "but—absent."

Mr. Evans laughed again.

"Not lost, but gone before! Come, Tom! We must go to work!"

He led the way up to the next floor, and at her door Mrs. Evans asked Helen if she would not come in.

Helen had a curiosity, which she thought harmless, to see their apartment, and she accepted the invitation in the drifting, indecisive manner which ladies have when they do not mean to commit themselves to the consequences of a self-indulgence. She did not feel quite sure of these people; she had a strong impression that she was their social superior; but, thrown with them as she was, she had too much good sense to hold stiffly aloof from them. She sat down, without, as it were, acknowledging that she sat down; and she followed Mrs. Evans about from room to room without seeming to do so, as well as she could manage that difficult effect. It was a very pretty little apartment of four tiny rooms, of which the last was Mr. Evans's study: this was just large enough to admit his desk and chairs, and was packed with books on shelves to the ceiling, and Helen inferred that he was some sort of literary man. She would not sit down again, but paid a frosty little net-work of compliments to the souvenirs of travel that she saw upon the tables and walls; she praised the balcony on which one of the windows opened, and she smiled upon the flowers with which Mrs. Evans had filled it. In fine, she guarded her distance with the skill that had kept the acquaintance at a stand-still, and yet left it resumable on more cordial terms at will. One is of one's world, after all; and, even in re-

signing her world, as she thought she had done, Helen had not yet made up her mind to be of a lower one.

She had promised to go down to Beverly on the morrow and tell her friends what she had done, as the condition of their letting her come up to Boston at all on that wild enterprise of hers, and, though she would have been glad not to go, she kept her word. But it was really not so hard meeting them as she had feared. Mrs. Butler was forbearing, and Marian preoccupied; the younger girls saw it somewhat as Helen did, and thought it an enviable adventure. She told them all that had happened in detail, and made them laugh. She partly dramatized her interview with the Miss Amys, and they said it was perfectly delightful to think of *Helen* being patronized by such people. They wanted to see Mrs. Hewitt and the fellow-boarders; they wished that somebody would trustee their mother; they said that the life Helen was leading was fascinating.

"Perhaps you wouldn't find it so fascinating if you were obliged to lead it," said Mrs. Butler.

"Helen leads it, and she finds it fascinating."

"Helen leads it out of the hardness of her heart, because her friends don't wish her to," returned Mrs. Butler, fondly.

"Mrs. Butler! Remember your promise!" said Helen.

"I hope you'll remember yours, my dear, to come back to us."

"Oh! And what are you going to do, Helen? What are you going to do for a living?" demanded Jessie Butler.

"Jessie!" cried her mother. "Don't be absurd! Do for a living?"

"I hope you wont think it absurd, Mrs. Butler," said Helen, with serious dignity, "for I really want to do something for a living."

"Poor child!" said Mrs. Butler, getting Helen's hand between hers, and tenderly smoothing it. "What could you do?"

"I don't know what yet. But I know I could do something."

She felt dispirited by Mrs. Butler's motherly kindness, and would have liked to take her hand away. This was what she had dreaded, this feeling on the part of such friends as the Butlers that anything useful and practical was impossible to her. For the moment this feeling seemed all that stood between her and a prosperous career of self-help; it unnerved her so terribly.

"Do tell us what you've been thinking of trying," persisted Jessie.

She was the youngest, and she ventured on almost as great freedoms with her mother and Helen as Marian herself did.

"Oh, I thought over a great many things as I came down this morning," answered Helen. "But I haven't settled upon anything yet. Indeed, indeed, Mrs. Butler!" she exclaimed, "I'm very much in earnest about it, and *don't* try to discourage me, please!"

"I wont, dear!" Mrs. Butler assented, soothingly, as if Helen were a sick child, and must be humored in her little fancies.

"How would plain sewing do?" suggested Jessie. "Or, Wanted by a young lady, to have the care of small children, where she would be received as one of the family, no objection to the country, wages not so much of an object as permanent home, address H. H., Transcript office?"

They laughed at this, Helen forlornly and helplessly with the rest. They could not realize her ambition, and they did not believe in her necessity: Mrs. Butler because she felt that all Helen need really do was to go to Europe with her, and return to marry Robert Fenton as soon as he could get leave to come home; the young girls because they had no experience of life, and could not imagine Helen's case. They were merry about her projects all through lunch, and Helen herself felt that she was behaving very ridiculously in pretending to be anything but the well-taken-care-of young lady that she had always been. The world which she had touched yesterday became as unreal in its turn as it had made her old life seem.

"I will tell you," said Marian, who had given the subject less attention than the rest, and had laughed at Helen with half her mind all the while on her approaching marriage; "I will tell you. In these days Helen must take to some form of ceramics. I wonder that we didn't think of it before. How could we discuss this subject in Beverly, of all places, and not think of pottery? Helen must decorate pottery for a living."

"Oh, yes! and she can drive over to the pottery this afternoon with us, and select the shapes!" clamored the younger sisters.

Their noise submerged Mrs. Butler's rebukes; there was open rebellion to her voice.

"Mamma!" cried Jessie, "you needn't *try* to put us down about this. It's an extraordinary case! We've never had the opportunity before to decide the vocation of a young lady who wants a lucrative employment. *Do* say you'll decorate pottery for a living, Helen!"

"Do! do!" pleaded all the rest. They had left their places and gathered round her in postures of supplication.

Helen was swept along in the tide.

"I don't know anything about ceramics," she laughed, turning upon the group.

"That's the beauty of the profession," they shouted in reply. "You don't *need* to know anything about it."

"I can't draw!"

"Drawing's the very last thing that's wanted for art pottery. *Say* that you'll drive over with us and select the shapes?"

"You must first begin with a bean-pot, like that pretty little Mrs. Gay," said Jessie Butler. "You ought to have heard her talk about it: so colonial, so in character with Beverly." The young girl gave the tone and the languish. "She decorated it with a flowering bean; they say she thought that was the kind they baked. Perhaps you'll find that they've begun to give bean-pots an æsthetic shape. Miss Harkness's bean-pots will become the fashion. We shall have a course of beans in their native earthenware at dinners, and when the pot comes in everybody will put on their *pince-nez*, and crane over and ask 'Is that a Harkness, Mrs. Jones?'"

"No, no! I can't go with you!" cried Helen. "I'm going back to Boston this afternoon."

They all protested; but Helen stood firm, feeling that it was her one chance for life, or for making a living. If she was ever to put in force her resolutions to be something and to do something, she could not get away too soon from an atmosphere in which no one, not even herself, could regard them seriously. It was a trying ordeal, this pity of Mrs. Butler's, and this jocose incredulity of the young girls; yet, as Helen rode back to town, she was more and more satisfied that there was something possible and practical in Marian's suggestion. She recalled some pretty shapes of pottery which she had seen in a shop window, and which seemed to her more stupidly decorated than anything she could do if she did her worst. They were there on sale, and somebody had been paid for doing them, or expected to be paid for it. The conclusion from the premises was irresistible, and Helen found herself impatient to arrive and begin work. She could really draw very prettily, though she had denied her gift; she was even a clever copyist; but she knew that she lacked the imaginative impulse, and she had not cared for what she could do, because so many others could do it as well.

As soon as she left the train she hastened to this shop, where, beside the decorated pots and vases, she had seen a good many uncontaminated examples of the Beverly ware. She was vexed to find the place already closed, and she could hardly wait for the morning.

She hurried from her breakfast to the shop in the morning. When her purchase came home, and she unpacked it on her bed (the largest and safest surface in her room), she cowered a little to see it so great in quantity. She blushed to find herself making such an ambitious beginning; and though five dollars had seemed a great deal to spend, she wished for the moment that it had not bought quite so much. But this was foolish; of course she must spoil some of the designs, and since she was going to try a variety of decorations, she should want a variety of jars. She set them all on the shelf of her closet, which she locked; she folded up the wrapping-paper and tucked it away; she even concealed the string; and, after putting on her hat and veil for the street, she had to sit down and have a paroxysm of guilty consciousness before she could summon courage to go out on her next errand.

She was going to a shop where they sold artists' materials, to get her colors and to pick up any hints they could give her there about her work. They were not personally very well informed, but they sold her several little books which had ceramic designs in them, and which would tell her all she wished to know. After she had bought them, she thought them rather poverty-stricken in their patterns, and as she passed a print-shop window she saw that pretty series of engravings, illustrative of the old fable of the storks and the babies; and the ceramic fitness of storks at once struck her. The prints were rather expensive, and Helen thought that she could not get on without the whole set. Then, as the matter developed in her mind, a great idea occurred to her: "Flaxman's Illustrations of Homer." They were, of course, the only things to copy in the classic shapes. The book cost more than she supposed it would; but as she meant to stop with that, she believed she might afford it, and at any rate she bought it. She was afraid to look the whole sum in the face at first, but her hopes rose with her rapid walk homeward, and she finally confronted the fifteen dollars with serene courage.

The next three weeks were given to very ardent if not very diligent labor. Helen had an insuperable shyness about her enterprise; she managed so that she might put everything out of sight at a moment's warning, if any one came to her room.

Before actually beginning upon the vases, Helen schooled herself in reproducing on paper the designs she meant to use, and this took time. She was also interrupted by excursions to Beverly; but she did not count this as loss altogether, for she was able to

make several studies in color of the low blackberry-vine, now in its richest autumnal bronze, and of certain sea-weeds, with which she meant to decorate several pieces. She did three with storks, and had a fourth half-done when she let it fall. She wrapped the fragments in paper, and took them out at twilight, and dropped them in the street some distance away, that the pieces might not be traced to her, and so proceeded to the Flaxmans. She chose three subjects among these: The old nurse Euryclea recognizing Ulysses as she bathes his feet; Penelope carrying the bow of Ulysses to the suitors; and the meeting of Ulysses and Penelope. These all related to the return of the wanderer, and they went very prettily round the vases. Ulysses following the homeward car of Nausicaa from the coast on which she found him shipwrecked was a subject which Helen instinctively rejected, though the lines were lovely, and she felt that she could do it easily. The jar which she decorated with the sea-weed had a band of shells round the middle; a slanting flight of birds encircled the vases, over which she taught the blackberry-vine to wanton.

She had many alternating moods of exaltation and despair while upon this work; but when it was all done, and the pots were set out in a fair row on her window-shelf, and she retired a pace or two with her pencil at her lip to get their entire effect, she could not but own that they seemed very successful. At that distance certain defects of drawing—such as that which gave Penelope bearing the bow rather a pert and mincing look—and other blemishes were subdued, but even when taken up severally and scrutinized merely at arm's-length, the vases bore the ordeal of critical inspection very well. "And no one," thought Helen, "will ever look at them more severely than I have."

She sank into her chair, which she drew up in front of her work, and indulged a long reverie. In this she dramatized her appearance at one of those charming shops where they deal in such things; she set little scenes in which the proprietors called one another up to look at her vases; and she dialogued their compliments and her own evasive acceptance of them. They ended by asking very respectfully if she could not be persuaded to employ a part of her leisure in doing something of the kind for them; and on her replying that these were for sale, they had instantly offered her a price for them that passed her wildest hopes; that seemed so much too much, indeed, that she insisted upon abating something from it. Struck by this nobleness in her, they had conversed in low tones together; and then the senior member of the firm had confessed that they had some hesitation in asking her to design certain friezes which they were to do for a cottage at Newport, and their admiration for her work must be their excuse if they were proposing something quite out of the way; but they begged her to remember that two ladies in London had taken up decorative architecture as a profession, and they trusted they were not wrong. Then Helen had replied, Oh, no, indeed! She was only too much flattered by their confidence in her, and she would be very glad to think it over; all that she feared was that she would not be able to meet their expectation; at which they had laughed, and said *they* had no such fear, and had drawn her a check for her vases, and had added a few hundreds as a sort of retainer in the matter of the friezes. At this point Helen broke from her reveries with "What silly, silly nonsense! What a simpleton I am!"

While she was in good humor with them, she resolved to pack her vases in the basket that she had got for that purpose, and when each was carefully wrapped and put in she laughed to find the basket looking like that of an old Jew who used to come to the kitchen-door to sell Bohemian glass when she was a child. The matter of transportation was one that she did not consider till the next morning, when it flashed upon her that she could not go carrying that basket about. She must drive, and though this did not accord with her severe ideas of economy, she had to own that she had been rather lavish in her preparations for work, and that it would be foolish to try now to scrimp at an impossible point. She would take a coupé by the hour, and perhaps get it cheaper if she had it several hours; though when she went out for the carriage, she found the driver inflexible, and she had to take it at the usual rate. She bade him drive her to Mrs. Hewitt's door, and she wanted him to go up with her and carry down her basket; but he, seeing her a single defenceless woman, boldly answered that he could not leave his horse, and Helen, indignant, and trembling for her secret, was forced to bring it down herself. Happily Miss Root had gone out; the Evanses' door was closed; and she encountered Mrs. Hewitt neither in going up nor in coming down. When she lifted the basket on the carriage-seat she was out of breath but exultant at her escape, and with unbroken courage she ordered the driver to go to the address given him. But it now occurred to her that she could not lug that great hamper across a crowded pavement into a shop-door, and she must sell her wares by sample. She

employed the driver in taking out the best of the stork vases, one of the most characteristic Flaxmans, and the blackberry-and-bird-banded jar. She scarcely dared look at them now, but as she gathered them to her bosom with one hand, while she caught up her skirt with the other to alight from the coupé, it was with quite as much hope as fear that her heart palpitated against those classic shapes. She pulled down her veil, however, for she knew that she was blushing violently; and when she stepped upon the ground she found herself giddy.

The people were all busy when she entered the store, and the gentleman to whom she hoped to speak was occupied with a lady whom Helen knew—a lady who gave proof of having lived abroad by the loud and confident voice which she had succeeded in managing, not like an Englishwoman but like an Englishman. Helen shrank from her recognition, and lurked about, pretending to be interested in distant bric-à-brac, and growing momentarily more faint and tremulous; but when the lady went out and the gentleman turned from closing the door after her, Helen came quickly forward. She plucked up an excited gasp from somewhere, and waiving the respectful kindness with which he bent to listen, said, "I've something here I'd like to show you," and she unfolded one of her vases, and as he took it up, with "Ah, yes! Something in ceramics," she unwrapped the others and set them on the shelf near which they stood. "Why, this is very nice, Miss Harkness," said the dealer; "very nice, indeed." He carried all three of the vases to the light and returned with them, holding out the bird-banded jar. "I like this one best. You've managed these birds and this vine in quite the Japanese spirit; they're the only people who understand the use of unconventionalized forms. The way your blackberry climbs into the neck of your vase is thoroughly Japanese. These storks are good, too—very effectively handled. The classic subject—well, I don't think that's quite so successful; do you?"

"No, I don't know that it is," said Helen, so grateful for his praise of the others that she would willingly have allowed this to be a disgraceful failure.

"Have you ever done anything of this kind before?" asked the dealer.

"No," replied Helen.

"Very remarkable," said the dealer. He had set the vases back on the shelf again, and now gazed at them somewhat absently. "It shows what can be done with this sort of thing. See here!" he called to his partner, who was also disengaged. "Here's something pretty, and rather new."

"Your work, Miss Harkness?" asked the other partner politely, coming up.

He said much the same things that the first had said; he even stopped a young lady assistant who was passing, and made her admire the jars. Then he also fell into a musing silence, while Helen waited with a thickly beating heart for the rest of her reverie to come true, and stayed herself against a counter, till these amiable partners should formulate some offer for her wares. The young lady assistant ebbed noiselessly away, and went to writing at a high desk; the second partner shifted from his right foot to his left, turned his head abruptly, and feigned to be called suddenly by some duty in the direction to which he looked. His going roused the first partner.

"Yes!" he said with a deep, nasal sigh, in coming to himself, and was sinking again into his abstraction, when he seemed to think of something. "Excuse me a moment," he said, and went and looked into the show window, and then into a dark corner in the back part of the room. "I thought we had some of that Cambridge pottery," he called out to his partner.

"No," said the other, remaining aloof, "we only had a few pieces."

"Well!" said the first, coming back to Helen. "I supposed we had some of it left. I was going to suggest, Miss Harkness, if you're interested in this sort of thing, that you ought to see that North Cambridge ware. Have you ever seen it?"

"No," answered Helen, faintly.

"It isn't so *native* quite in sentiment as this Beverly ware, but is much more refined in form. It's beautifully finished. Really, I don't see how it falls short of that Copenhagen pottery to finish. If you have plenty of time on your hands, you couldn't do a better thing than go out to see them making it. I think it would interest you."

"Thank you," said Helen; her head whirled, but she resolved to speak steadily if it killed her. "I shall certainly go. I'm glad you mentioned it. I never saw any of it."

She fumbled piteously at the papers which she had taken off her vases, and the dealer brought some softer stuff, and skillfully wrapped them up for her.

"These things are quite worthy of Japanese paper," he said, indicating the silky texture of the fabric he had used. "I'm sure I'm very much obliged to you for letting us see your work, Miss Harkness. It's charming. I hope you'll keep on at it. I'm interested business-wise, you know," he added, "in having you ladies take up these graceful arts. And be sure and go to see that Cambridge

ware. We can get some of it for you, if you wish." He had followed her to the door, and now opened it for her, with a bow.

"Thanks," said Helen. "I wont forget. Good-morning."

"Good-morning."

She got into the coupé, and put her vases carefully back in the basket, and sat down on the seat beside it. She quivered with the intense and bitter disappointment, and she burnt with shame, as every particular of her interview blazoned itself upon her consciousness, and she realized that she had no one but herself to blame for the precise result. The people had been thoroughly kind and sympathetic; they had praised her work, and had been far more interested in it than she had any right to expect; but their taking her on her old social plane had made it impossible for her to meet them on any other. Apparently, they had never once imagined that she wished to sell these things, and she had not known how to approach the fact. They had thought she wished merely to show them as matters of æsthetic interest; but if they had not supposed she came for advice, what could they think of her conceit in making such a display, and of staying and staying till she had all but to be turned out of doors! All that about the Cambridge ware must have been a polite ruse to get rid of her,—to spare her feelings while they relieved their own. What had kept her from telling them honestly and bravely what she had come for? Did she really expect them to ask her if her work was for sale, as in her reverie; and then offer her that frieze to do in Newport? It was intolerable! She literally bowed herself down in self-contempt, while her heart ached with the sickening defeat of her hopes.

"Where to?" asked a gruff voice.

She had been sitting still in her coupé, and this was the voice of the driver, as he leaned over from his seat, and projected the demand in at the window.

"Oh!" cried Helen. Then she hesitated in a flutter. She had never thought where she should go next; she had not taken any next place into account. "Oh! Drive—drive——" She hesitated again, and then she gave the address of the street where she had bought her pottery. She remembered the decorated pieces there; and they might like hers. At any rate, the people did not know her, and she should have the courage to offer them her work.

She began somewhat as at the other place: "I thought you might like to see ——," and then corrected herself, and said, "I wished to show you my decoration of some of the Beverly ware I got here the other day."

"Oh, yes," said the shop-man,—warily Helen thought. But she undid her vase and saw him smile in approval. "They'v come out very well," he added, as if they ha been subjected to a process. "Here are som new shapes, which we've just got in to-day.

Helen only glanced at the vases he ind cated. "I see you have some decorate pieces here," she said, hastily. "Would yo like to buy these?"

The man's smile gave place to a look o something like anguish. He took off his ha and scratched his head. "Well—well—no this *morning*, I think. The fact is, it's a ne thing, you know; and these decorated piec are principally to show what may be don with the ware. We do sell them, but we don —we don't buy. By and by, I hope we sha be able to do so, but as yet we only expe to supply the plain ware to ladies who wis to paint it. There *are* places where——" H looked still more distressed and stopped.

Helen hastily wrapped her jars up agai and turned to go. The man followed her few paces.

"Your own work?" he asked.

"Yes," said Helen, shortly, without look ing round. "Drive slowly along Washingto street," she ordered; and as the coupé starte she blamed herself for not re-opening the pa ley at the man's last question, and trying t learn of him something about those othe places he had begun to mention. She wa too much bewildered to do that, but it mus have looked like pride. Helen resolved no that she would be not only bold but meek.

She had a plan of stopping at various littl shops, in whose windows she remembere seeing artistic caprices, like pictures in birch bark, and comic designs jig-sawed out o white-wood. They might somewhere take fancy to her vases. She stopped accordingl wherever bric-à-brac showed itself in an sort. The street was full of people, that is t say, of women, thronging in and out of th shop doors, and intent upon spending th money of their natural protectors. It is al ways a wonderful spectacle, and in the ci cuit of a quarter of a mile, about the conflu ence of Washington and Winter streets, i enforces itself with incomparable vividness.

There is doubtless more shopping in Ne York, or London, or Paris, but in those citie it is dispersed over a larger area, and no where in the world perhaps has shoppin such an intensity of physiognomy as in Bos ton. It is unsparingly sincere in its expres sion. It means business, and the sole busines of the city seems to be shopping. The lovel faces of the swarming crowd were almos fierce in their preoccupation, as they presse

into the shop doors; as they issued from them, and each lady stooped and caught the loop of her train in one hand, while she clasped half-a-dozen paper parcels to her heart with the other, those faces exhibited no relaxation of their eager purpose. Where do they all come from, and where does the money all come from? It is a fearful problem, and the imagination must shrink from following these multitudinous shoppers to their homes, in city and suburb, when they arrived frayed and limp and sore, with overspent allowances, and the hard task before them of making the worse appear the better reason.

Helen was dismayed to realize herself the only one of all her sex who wished to sell and not to buy, and at the shops which she entered they were puzzled to conceive of her in that unique character. They were busy with the buyers, and when she had waited about patiently, and had at last found a moment to show her work, they only considered it in various patterns of indifference and refusal. For the most part they scarcely looked at it, and Helen found her scantiest toleration at those places where she was obliged to deal with women. Commonly they could not put her errand and her coupé intelligibly together; the conjunction seemed to raise suspicion. In one shop it raised laughter, which followed her from the young lady behind the counter, who said quite audibly to the young lady at the desk: "Actually in a coupé! Think I should walk myself!" Helen, who had now hardened her sensibilities to everything, took the hint, and let the carriage come after her from shop to shop. But that served no purpose except perhaps to excite the fears of the driver lest she should try to escape from him. When every place had been tried, she still had her vases on her arm, which, when she got them back into the basket, she perceived was sore with carrying them.

"Home," she said to the driver, and leaned back against the cushions, and closed her hot dry eyes. She was so benumbed by what she had undergone, that she did not feel very keenly, and her physical fatigue helped off the mental pain. Presently the carriage stopped, and she saw they were in a jam of vehicles in front of a large jewelry store. There had been something the matter with her watch, and now she thought she would have it looked at; and she dismounted and went in. She gave her watch to a man behind one of the counters, and while he screwed a glass into his eye, and began to peer and blow into the works, Helen cast a listless look into a window where there were some jars of limoges and plates of modern majolica. A gentleman, who did not look quite like a clerk, came forward. Helen carelessly asked him the price of some of the faïence. It seemed very little, and he explained that it was merely earthenware painted in imitation of the faïence, and began to praise it, and to tell who did it. Helen did not listen very attentively; she was thinking of her own work, and wondering if she should have courage to ask him to look at it, and how, if she should, she could get it from the coupé without awkwardness, when he said, "I see you have something there in the way of our business." Then she saw that she had mechanically gathered up her three vases and brought them in with her on her arm; she had long ceased to wrap and unwrap them. She looked at them stupidly, but said, "Yes, this is something I've been doing"; and the gentleman politely took them and admired them with a civility that was so cordial to her after the ordeal she had passed through that the tears came behind her veil.

"Do you think," she asked, very timidly, "you would like to buy something of the kind?"

"M—m—no," said the gentleman musingly, as he turned one of the vases over in his hand.

Helen's breath came again, and she turned to get her watch, which the workman said was ready; one of the wheels had caught, merely; and there was no charge. She took back her vase, and nodded to the gentleman. He did not bow very definitively in return, but followed her to the door.

"The fact is," he said, "there's very little sale for these things now. The whole decoration business has been overdone. However," he added, after a pause in which he seemed to take in the fact of Helen's black, "we might chance to dispose of them for you. If you like, you can leave them here on sale." Helen promptly handed him the vases.

"You mustn't form any expectations," he cautioned. "It will *be* a chance. *What* shall I ask for them?"

"Oh, anything—anything you can get," cried Helen, desperately. "Nobody wants them."

"Well, we'll see," said the other, and now he set the vases in the window between the jars of imitation faïence.

Helen timidly offered him her card, and she stole a glance at the vases from the outside, and thought they looked very common and dreadfully personal. Their being there gave her neither hope nor pleasure.

The door of the coupé stuck fast, and while she stood tugging at it a policeman stepped

up and opened it for her. "See here, my man," he said to the driver, "you'd better get down and wait on your passengers decently, or give up the business. What's your number?" and, while the man mumbled something in explanation and excuse, Helen looked up into the face of her champion. She failed at first to recognize the civil fellow who had come home with her father the day of the seizure, and whom she had met on the steps; but the officer knew her, and touched his hat.

Then she remembered him. "Oh, is it you?" she cried, as if it was some old friend.

"Yes," said the officer, very much pleased.

"I've always wanted to see you again, and thank you," began Helen.

"Oh, *that's* all right," answered the officer. "Your father was a *man*, I can tell you. I—I—I was awfully sorry for you, Miss Harkness." He spoke with a simple cordiality, that Helen felt it nothing odd to be shaking hands with a policeman at high noon in Washington street.

"Thank you, you are very kind. Goodbye. I shall never forget your goodness to him that day."

"Oh, don't mention it," said the policeman. He touched his hat again, and vanished in the crowd; and she reflected that she had not asked his name. As she looked in the direction he had gone, she saw not him, but herself. She saw herself standing on the threshold of her old, lost home, and turning to look after this man with the stare of amused, haughty wonder, that a girl bred in ease and fashion, and fondly shielded from all that was rude or was abrupt in life, might fitly bend upon such a curious piece of the social mechanism, unexpectedly and inconceivably related to herself. Her attitude implied secure possession in perpetuity of whatever was gracefully supreme in the world, of whatever was prosperously fastidious and aloof. It was enough to remember this attitude now.

The coupé stopped at Mrs. Hewitt's narrow door, and the man got down and helped her out. "I guess the horse is tired enough to stand while I carry this basket up for you," he said.

Helen had no gratitude to express, and she did not thank him for this service when she took out her purse to pay him. She had kept the carriage two hours and a half, and he said they never counted less than an hour, but he would call it four dollars. As he folded the bills, he said he hoped she did not blame him for not opening the coupé door for her; she got out and in so often, and his horse always started up so when he left the box.

"Oh, no, no!" cried Helen. "Only go, please."

She closed the door behind him, and she flung herself upon the bed, and hid her face in her pillow, and drenched it with her rushing tears. Her head ached, and her heart was sore in her breast. All that had happened repeated itself with ceaseless iteration in her mind; all the looks, all the tones, all the words—they burnt, and rang, and hummed in her brain; the long ordeal of her disappointment dramatized itself to the inner sense in thousand-fold swift reverberation; the disappointment was as bitter as if starvation were before her, and the shock to her pride was even greater. She had fancied, as she now realized, that she should succeed because she was she; while warning herself that she must not expect anything but failure, she had secretly cherished an ideal of triumph that made the future a matter of fortunate inspirations and delightful toil. This was what she had really hoped; and now, to her defeat was added the stinging sense of having been a fool. She had probably set to work quite in the wrong way; and she had been not only a fool, but such a coward as to be afraid to say that she wished to sell her work to the only people who could take a special interest in it. Yet they might not have cared for it either, and if she had spoken she would have had only one ignominy the more to remember. For, what puzzled and surprised Helen most of all was that when she had taken the humblest mien, and approached those shop people on their own level, as it were, without pretension and without pride, they should have shown no sense of the sacrifice she had made, but should have trampled upon her all the same.

The glamour was gone from her experiment. She was in the mood to accept any conditions of dependence; she wondered at the vain courage with which she had refused the idleness and uselessness of the home offered her by the Butlers.

The dinner-bell rang, but she remained with her face in the pillow: after a while some one tapped at her door, and then pushed it softly open and looked in. But she did not stir. Whoever it was must have thought her asleep and so left her; yet when Helen opened her eyes there was still some one in her room. A shawl had been flung over her, and Miss Root was sitting at the window looking at her and apparently waiting for her to wake up.

"Not going to be sick, are you?" she asked. "You've been sleeping ever since before dinner, and Mrs. Hewitt asked me to look in and see how you were getting along. I guess you haven't taken cold; she put the shawl on you."

"Oh, no!" said Helen, rising briskly, in

the first free moment of waking, when care has not yet dropped back upon the heart. "I came in with a headache, and threw myself on the bed to rest."

"That some of your work?" Miss Root indicated with a nod the basket which stood in the middle of the floor where the man had set it. The paper had come off one of the jars, and showed its decoration.

"Yes," said Helen. "I did them—I——" A thought flashed into her mind: "They are for a wedding present!"

"May I look at it?" asked Miss Root.

"Certainly," said Helen, feeling bolder, now that she was protected by this little outwork of unreality against the invasion of Miss Root's sympathy. She unwrapped two or three of the jars and set them on the window-seat.

Miss Root did not trouble herself to take them up, but stood at a little distance and glanced at them with an eye that Helen saw understood and classed them, and that made her feel like the amateur she was. The girl turned away without comment.

"I saw some just like them in a window as I came along Washington street. I pity any poor wretch that expects to live by painting and selling them."

Miss Root could not have meant her equivocal speech in unkindness, for she added, looking back as she went out, "Don't you come down if you don't feel just right; I'll bring up your supper to you."

Helen said she was going down, and arming herself with the courage of her despair, she confronted the question of the tea-table with gayety even, and made light of her long nap. She said she had been shopping all the morning, and the irony of the phrase in this application flattered her bitter mood. It was a stroke of the finest sarcasm, could they but know it; and in her heart she mocked at their simple acceptance of her statement.

Mr. Evans said he was suprised she could sleep after shopping. When his wife went shopping it kept the whole family awake for the next twenty-four hours and care-worn for a week. Mrs. Hewitt asked about the fashions, and said that she always found things just as cheap and a good deal better at the large stores, and you spent more time and laid out as much money running round to the little places. It seemed to Helen the height of the sardonic to answer—"Yes, it was quite useless to go to the little places."

"D'you find your letters all right, Miss Harkness?" asked the landlady, when this talk had taken its course. "I put 'em on the corner of your mantel."

"No," said Helen; "I didn't look."

"Well, you'll see 'em when you go back. They came after you went to sleep. The most curious stamps on *I* ever saw."

Helen's heart stood still with fear and hope; and "Oh, papa, get them for my collection," pleaded the little boy.

"Here," she said, rising, and making this opportune prayer her shelter, "come up with me, and you shall have them"; and after due reproach from his mother, he was suffered to go with her.

It was Robert Fenton's handwriting on the envelopes. "It's my answer—it's my sentence—and I deserve it," she said, under her breath, as she stood with the letters in her hand, trying to detach one of the stamps with her trembling fingers.

"There!" cried the boy, "you're tearing it!"

"Never mind," said Helen; "they're both alike. I'll cut this other off for you."

But her hand shook so that she chopped into the letter a little with the scissors.

"If I couldn't cut better than that!" roared the boy, anxious for the integrity of his stamp. "What makes you get so white, and then get so red?"

"Oh, nothing, nothing!" answered Helen, incoherently. "Here's your stamp." She stooped to give it. The child was pretty, with still gray eyes and full lips. "Will you kiss me, Tom," she asked, in a very soft, trembling voice, "for good luck?" It seemed as if her fate hung upon his will; but when he hastily kissed her and ran out, she still had not courage to open the letters. She flung them on the bed and locked the door, and then came back and looked at them. She could see a little of the writing in one through the hole where she had cut away the stamp, and she tried to make out the words; they were such words as "from," and "four," and "with."

If there had been but one letter, she thought, she should not have been afraid of it; but this mystery of there being two! She tried putting one out of sight under the pillow, but that did no good. Her sole comfort was that while they were still unopened she did not know the worst; but in the meantime she was consumed with a terrible curiosity. She studied them hard, and then walked away to the farthest corner.

"Oh, what *is* it in them? Indeed, I couldn't bear anything after to-day, indeed I couldn't!" she whimpered. "I *can't* open them!"

And then she pounced upon one of them in a frenzy and tore it open.

(To be continued.)

CARDINAL MANNING.

THE painter who, conscious of his own deficiencies, has yet satisfied his patrons by a portrait executed to order, may well hesitate to fulfill the task if requested to furnish a companion picture. The subject, however worthy, may not appeal so fully to his own interests or imagination; the character may not be so familiar to him, or have been studied so long; the light in which the picture is to hang may be different; the original may be better known, and the representation therefore more open to criticism. Just as I think any painter may feel, so do I feel in reality when asked by the Editor of THE CENTURY to contribute to these pages a sketch of Henry Edward, Cardinal Archbishop of Westminster. Whatever insufficiency I was aware of in myself, in contributing a sketch of Cardinal Newman, is much more obvious to me in the present undertaking. Were it conceivable to me that I should ever become a Catholic, I should, in joining the church, be more attracted by the school of thought to which, as it seems to an outsider, Cardinal Newman belongs, than to that of Cardinal Manning; while my very complete sympathy with much of the Archbishop's political, social, and philanthropic work serves, though the logical process is not very clear, to intensify my theological distance from him. What, however, the readers of THE CENTURY wish is not a portrait of the man by one of his own intimates, or by one of his own faith, but rather a sketch of one of the foremost men in modern London, and the foremost representative of the Catholic Church in England. This I essay to give, not without diffidence, but with every wish to be honest and fair.

Cardinal Manning is in his seventy-fourth year. He is the son of the late William Manning, M. P., and Governor of the Bank of England, and was educated at Harrow and Baliol, migrating thence, after taking the highest honors, to become a Fellow of Merton. He is a typical public school man, and could scarcely have been at any but a fashionable public school. Men who have not had such training may have courtly manners, may be thorough men of the world; those educated at home may have equal, sometimes more, erudition; but the combination of learning worn lightly like a flower, great frankness of manner with power of reticence when needed, aptness for being at home in any society, from the rough to the courtier and simple unconscious ease, are generally to be found among Englishmen only in those educated at our first-class public schools. These were the qualities which, joined with his birth and his father's position, gave him, even as a very young man, a commanding influence in Oxford society, which raised him to be Archdeacon of Chichester at the early age of thirty-two, and which have made him so great a power in his own communion since he joined it. They have also given him influence among very various classes of society, especially among the great, so that his brother-in-law, the late Bishop of Winchester, smarting under the desertion of his friend and unable to deny himself the use of epigram, called him the "apostle of the genteels." He became Rector of Lavington and Graffham in Sussex in 1834, and married the youngest Miss Serjeant, one of the co-heiresses of the Lavington property, two other sisters having married Samuel Wilberforce, afterward Bishop, and Henry Wilberforce, his brother. Mrs. Manning survived her marriage but a few months, and the four volumes of "Parochial Sermons," published by Archdeacon Manning while Rector of Lavington, show the effect upon a sensitive nature of a very deep and early sorrow, which strengthened the spirituality of his nature and turned his thoughts more and more toward the unseen world. All that was deepest in him, just as what was true in the nature of Bishop Wilberforce, was touched and strengthened by the loss of their young and beautiful wives. This great sorrow, by which his after elevation in the church of his adoption was rendered possible, has not always been looked upon by his co-religionists in the same light. It was one of the canons of his own Pro-cathedral who said that the greatest blow the Catholic Church had received in this century was the death of Mrs. Manning.

A quiet residence among the Sussex downs might have put an extinguisher on many men; it put none on Manning. Any one who reads the lives of the Wilberforces, or the many biographical and other contributions toward the history of the English Church during the Tractarian movement, will recognize the considerable part which Manning played; and when he became Archdeacon of Sussex his charges were among the

forces that affected the whole religious and political attitude of a large and often dominant section of the English Church.

It may be here well to quote, both as a specimen of his style and of the tone of thought in which he habitually lived, the concluding sentences of a sermon published by him on "Commemoration of the Faithful Departed":

"Therefore, the Church commemorates their [the saints'] earthly welfare, that we may go forth out of ourselves in a reverent love for those whose sanctity abashes our inflated self-esteem. She bids us remember that, in comparison with her mighty dead, we are but worms; that the Church is not ours to rend and set in array, nor to patronize and irreverently praise; that we are but one of a flowing tide of generations — one only — and that neither the worst nor the best. Better were it for us to stand in awe at our own littleness. We are but a handful of restless, therefore, self-exalting children in the sight of the Church unseen.

"Therefore, year by year, let us reverently commemorate their names, remembering what they were, but steadfastly gazing at what they are. Their very words are still ringing in our ears: of some the beloved image, too, is full before us. Let us live as they would bid us, could they still speak: let us fulfill their known behests, following in their steps, filling up the works that they began, carrying on their hallowed offices now bequeathed to our care: let us be like them in deadness to sin, and increasing homage to our unseen Lord. As we grow holier, we grow nearer to them; to be like them is to be with them; even now they are not far from us; we know not how nigh. As yet, for a time, the veil is drawn. We shall know all at His coming. It may be, we shall say: What! so near, and we could not see you? At times we could almost fancy we were not alone; but when we strained our sight, we saw nothing; when we listened, all was still."

But Manning was by no means consciously approaching the goal at which he afterward found himself; so far from this, that while the commemoration of the Gunpowder Plot was still a scandal to the English Liturgy, Archdeacon Manning preached before the University of Oxford a violent tirade against Popery with a vehemence unusual in an English, and still more in an university pulpit. He declared it to be impossible that the Pope should ever again have the jurisdiction in the realm of England; and his indignant declamation profoundly distressed many of those who, though not aware that they might themselves be drawn into closer relations with the Roman Church, yet desired to "speak gently of our sister's fall." Newman was then in retirement at Littlemore, preparing for the end, which was shortly coming — his own reception into Catholicism. Archdeacon Manning walked out to Littlemore to call upon him, but the report of the disastrous sermon had already preceded the preacher. The door was opened by one of those young men, then members of the quasi monastic community, who had to convey to the Archdeacon the unpleasant intimation that Dr. Newman declined to see him. So anxious was the young man to cover the slight, and to minimize its effect, that he walked away from the door with the Archdeacon, bare-headed as he was, and had covered half the way to Oxford before he turned back, unaware, as was his companion, of his unprotected state, under a November sky. So strangely do we change in these changing times, that it is hard to realize that the perplexed novice was Mr. J. A. Froude.

Those who read Archdeacon Manning's "Parochial Sermons" will recognize yet another predominant note besides that of nearness to the unseen world, although closely in harmony with the former. This is the note of sacramental channels of grace. Hence, when the spiritual grace of baptism was denied by Mr. Gorham, and his view pronounced to be tenable within the Church of England, Archdeacon Manning, with many others, felt the very ground on which they stood cut from under them. If the Church of England denied sacramental grace, which to them involved the very essence of religion, there was indeed nowhere to turn but to the Church of Rome, however impossible it had once seemed that they should do so. Immediately after the Gorham judgment was pronounced, Archdeacon Manning shook from his feet the dust of an heretical Church, to join that toward which his steps had so long unconsciously been advancing; when no doubt he found that the boundaries were by no means so difficult to overstep as they had seemed to him on that November day. After the short retirement, inevitable on his change, preparatory to taking orders in the church of his adoption, his rise was rapid and signal. He, too, like his brother cardinal, founded a congregation, that of the Oblates of St. Charles Borromeo, filling in the interim the dignified office of Provost of Westminster. In 1865, Monsignor Manning was consecrated Archbishop of Westminster. In 1875, he was created a cardinal with the title of Saints Andrew and Gregory. Since his appointment as archbishop few men have ever been more before the world. Not only is he a constant preacher in, and a frequent preacher out of his diocese; not only has he been a combatant in intellectual contests, especially in the Metaphysical Society, a club which met monthly, where he held his own with such disputants as Dr. Martineau, Mr. Frederick Harrison, and Professor Huxley, — he has also taken part in the social life of London to such an extent that there is hardly

a philanthropic work in which he could consistently coöperate wherein he has not been a sharer. Conspicuous above all has been the aid that he has given to total abstinence societies both in and out of his church. In politics he is understood to take a strongly democratic view, and has been heard to say that, were he not what he is, his choice would be to be a demagogue. On the Irish question, and to some extent on the extreme Irish side, he has been very outspoken; and should it hereafter prove to be possible that the Catholic Church, at least in the West, should ally herself with the cause of the people, as distinguished from the cause of the oligarchs, Cardinal Manning's name will be found on the roll of those who have helped the fusion.

One signal exception, indeed, there has been. The language in which he allowed himself to speak of the son of the perjured usurper of France, stricken down as a filibuster in a war with which he had nothing to do, was a profound grief to many who deeply admired His Eminence. Making all allowance for the feelings excited by a mother's sorrow and the death of a prince, so-called, who chanced to be Catholic, it was distressing to hear so powerful a voice lamenting the extinction of a dynasty which not all the sacred oil of Rheims could have made other than accursed, and from whose right hand the blood of the slaughters of the Second of December could never have been washed. And, indeed, it is this coquetting with tyrants, in spite of the upsurging, from time to time, of nobler and better feelings; it is this retrogression to the side of all that is base and foul in government, which—far more than dogmas, of which nearly all can be accepted metaphysically and transcendentally—keeps at a distance those who might be attracted by the great history or the soothing promises of the church which Cardinal Manning has adopted.

Those who attend his many sermons and speeches, those who read his published sermons and have a right to judge, tell us that the fervor of devotion which was so remarkable in the sermons of the archdeacon is to be found, enhanced and deepened, in the discourses of the archbishop. The keen arguments, the statesman-like papers on the Independence of the Holy See, the astute special pleading on behalf of the Vatican Council, have not dimmed the fervor of devotion. The man of the world never for an instant ceases to be the priest; and we believe that many a death-bed, which might have been not unfairly left to the ministrations of the minor clergy, has been blessed by the uplifted hand of him who in England bears the weight of all the churches. And, while many might take the Cardinal-Archbishop as an incarnation of shrewd, every-day common sense, his recognition of the pilgrimage to Lourdes shows that he yet feels how completely the church of the nineteenth century is the church of the Middle Ages, and that he shrinks from no recrudescence of modern miracles, however physical.

The eminently practical nature of the man has been shown in his choice of a residence. In all London there could scarcely have been found a house which, *primâ facie*, was less adapted for a home than the gaunt, ugly building standing a little south-east of the Victoria Station, erected by philanthropic officers a good many years ago as a club for the non-commissioned officers and men of the Guards. Its great echoing stone hall, its bare, square rooms, well intended for public purposes, seemed but ill adapted for a home; but when the Guards' Club failed as a speculation here was a house, cheap and large and handy—a building capable of being invested with a certain magnificence—and for comfort its occupant cares but little. No other great man is more accessible than the Cardinal. Through no rooms are ushered men of more various opinions than through these great halls, Italian in their spaciousness, all English in their chilliness. And yet a certain dignity and grandeur seem to haunt them and surround also their spare, even emaciated tenant. The windows of this uninviting abode look out on a dreary waste at the backs of houses, overgrown with what can only by courtesy be called grass—a squalid inclosure; but, to the Cardinal, this plot probably presents a different aspect than to the ordinary beholder, for it is the site of the cathedral which he intends to erect, and of which a design hangs on the walls of his chief reception-room. No doubt in his mind's eye there rise soaring arch and lofty spire, and the vision of England, Catholic once more, thronging its wide portals. We see no indication of the realization of such a view. What if converts by the hundred are to be numbered among the principal ranks, both of intellect and birth? What are they, even hundreds, among so many? What if there be into England large incursions of poor Irish, or poor Italians, or poor French, so that the churches in Westminster or Hatton Garden are thronged?—there is no sign whatever that the great bulk of the middle class of England are anything but sturdily Protestant, tolerating, but by no means accepting, the Catholic faith. Yet we would not, if we could, forbid the Cardinal to complete his church and to dream his dream, being well assured that his efforts, in whatever they

result, must result at least in this—the moral elevation and ennobling of those who fall under his sway. Not wholly popular,—for his pastoral staff is somewhat rigid, and does not bud and blossom like the rod of Aaron,—he is yet thoroughly respected and revered by the Catholics of England. There are, indeed, cynics among his priests who think that he has made but little way in some of the causes which he has most at heart, and that, were his personal influence removed, the great teetotal organization of the League of the Cross would crumble to dust. But however this may be, we know too well that no man can carry out one-half the schemes he sets before him, and that, at any rate, in the words of George Herbert, he

> "Who aims a star
> Shoots higher far than he that aims a tree."

Those who are not of his own faith may be led to admire the indomitable pluck and vigor of one among the most prominent figures of our present London world.

C. Kegan Paul.

MORAL PURPOSE IN ART.*

In the last lecture, we obtained a view of George Eliot's "Daniel Deronda" as containing two distinct stories, one of which might have been called "The Repentance of Gwendolen Harleth," and the other "The Mission of Daniel Deronda"; and we generalized the principal objections against the work into two, namely, that the main characters were prigs, and that the artistic value of the book was spoiled by its moral purpose. In discussing the first of these objections, we found that probably both of them might be referred to a common origin; for examination of precisely what is meant by a prig revealed that he is a person whose goodness is so downright, so unconforming, and so radical that it makes the mass of us uncomfortable. Now there can be no question that so far as the charge of being overloaded with moral purpose is brought against "Daniel Deronda," as distinguished from George Eliot's other works, it is so palpably contrary to all facts in the case that we may clearly refer it to some fact outside the case; and I readily find this outside fact in that peculiar homethrust of the moral of "Daniel Deronda" which has rendered it more tangible than that of any preceding work which concerned time past. You will remember, we found that it was only in "Daniel Deronda," written in 1876, after thirty years of study and of production, that George Eliot allowed herself to treat current English society; you will remember, too, how we found that this first treatment revealed, among other things, a picture of an unspeakable brute, Grandcourt, throned like the Indian Cama above the multitude, and receiving the special adoration of the most refined young English girls with a blasé stare,—a picture which made the worship of the golden calf or the savage dance around a merely impotent wooden idol fade into tame blasphemy. No man could deny the truth of the picture; the galled jade was obliged to wince; this time it was *my* withers that were wrung. Thus the moral purpose of "Daniel Deronda"—which is certainly beyond all comparison less obtrusive than that of any other book written by George Eliot—grew, by its very nearness, out of all perspective. Though a mere gnat, it sat on the very eyelash of society and seemed a monster.

In speaking of George Eliot's earlier stories, I was at pains to show how explicitly she avowed their moral purpose: in "Amos Barton," in "Janet's Repentance," in "Adam Bede," everywhere there is the fullest avowal of didacticism; on almost every other page one meets those direct appeals from the author in her own person to the reader, in which George Eliot indulged more freely than any novelist I know, enforcing this or that moral view in plain terms of preaching. But it curiously happens that even these moral asides are conspicuously absent from "Daniel Deronda": the most cursory comparison of it in this particular with "Adam Bede," for example, reveals an enormous disproportion in favor of "Deronda" as to the weight of this criticism. Yet people who had enthusiastically accepted and extolled "Adam Bede," with all its explicitly moralizing passages and its professedly preaching characters, suddenly found that "Daniel Deronda" was intolerably priggish and didactic.

But resting thus on the facts in the case—easily provable by comparing "Daniel Deronda" with any previous work—to show how this censure of didacticism loses all momen-

* Being the opening pages of the late Sidney Lanier's Last Lecture, Johns Hopkins University, April, 1881.

tum as against this particular book, let us advance to the more interesting, because more general, fact that many people—some in great sincerity—have preferred this censure against all of George Eliot's work, and against all didactic novels in general. The objection involves many shades of opinion, and is urged with the most diverse motives and manners. At one extreme we have "The Saturday Review" huskily growling that the office of the novelist is to amuse, never to instruct; that George Eliot, in seeking the latter, has even forfeited the former; and that "Daniel Deronda" neither amuses nor instructs; whereupon George Eliot is derisively bid, in substance, to put on the cap and bells again and leave teaching to her betters,—with a voice, by the way, which is wondrously like that with which the "Edinburgh Review" some years ago cried out to our adorable John Keats, "Back to your gallipots, young man!" From this extreme we have all shades of opinion—to that vague and moderate apprehension much current among young persons influenced by a certain smart sound in the modern French phrase, "*L'Art pour l'Art*," or by the German nickname of Tendency books—that a moral intention on the part of an artist is apt to interfere with the naturalness or intrinsic beauty of his work; that in art the controlling consideration must always be artistic beauty, and that artistic beauty is not only distinct from, but often opposed to, moral beauty.

Now to discuss this question *a priori*, to go forward and establish an æsthetic basis for beauty, involving an examination which must range from Aristotle to Kant and Burke and Mr. Grant Allen's physiological theories, would require another course of lectures quite as long as that which is now ending; and you will remember I was careful to say in my last announcement, not that I would attempt to *discuss*, but (the words used were) to "throw some light upon this question" in the present lecture. And so, to proceed immediately to that work with some system, permit me to recall to you, in the first place, that the requirement has been, from time immemorial, that wherever there is contest as between artistic and moral beauty, unless the moral side prevail all is lost. Let any sculptor hew us out the most ravishing combination of tender curves and spheric softness that ever stood for woman; yet, if the lip have a certain fullness that hints of the flesh, if the brow be insincere, if in the minutest particular the physical beauty suggest a moral ugliness, that sculptor, unless he be portraying a moral ugliness for a moral purpose, may as well give over his marble for paving-stones. Time, whose judgments are inexorably moral, will not accept his work. For indeed we may say that he who has not yet perceived how artistic beauty and moral beauty are convergent lines which run back into a common ideal origin, and who, therefore, is not afire with moral beauty just as with artistic beauty,—that he, in short, who has not come to that stage of quiet and eternal frenzy in which the beauty of holiness and the holiness of beauty mean one thing, burn as one fire, shine as one light, within him, is not yet the great artist.

Here it is most instructive to note how the fine and beautiful souls of time appear after a while to lose all sense of distinction between these terms,—Beauty, Truth, Love, Wisdom, Goodness, and the like. Hear some testimony upon this point: this is a case for witnesses. Let us call, first, Keats. Keats does not hesitate to draw a moral, even from his "Grecian Urn," and even in the very climacteric of his most "high-sorrowful song"; and that moral effaces the distinction between truth and beauty.

"Cold pastoral!" he cries, at the end of the "Ode on a Grecian Urn,"

> "When old age shall this generation waste,
> Thou shalt remain, in midst of other woe
> Than ours, a friend to man, to whom thou say'st
> 'Beauty is truth, truth beauty,'—that is all
> Ye know on earth, and all ye need to know."

Again, bearing in mind this identity of truth and beauty in Keats's view, observe how Emerson, by strange turns of thought, subtly refers both truth and beauty to a common principle of the essential relation of each thing to all things in the universe. These lines are from his poem called "Each and All":

> "Little thinks in the field yon red-cloaked clown
> Of thee from the hill-top looking down;
>
> * * * * *
>
> The sexton tolling his bell at noon
> Deems not that great Napoleon
> Stops his horse and lists with delight
> While his files sweep round yon Alpine height;
> Nor knowest thou what argument
> Thy life to thy neighbor's creed has lent.
> All are needed by each one;
> Nothing is fair or good alone."

Nothing is fair or good alone: that is to say, fairness, or beauty, and goodness depend upon relations between creatures; and so, in the end of the poem, after telling us how he learned this lesson by finding that the bird-song was not beautiful when away from its proper relation to the sky and the river, and so on, we have this:

"Then I said 'I covet truth;
Beauty is unripe childhood's cheat;
I leave it behind with the games of youth.'
As I spoke, beneath my feet
The ground-pine curled its pretty wreath,
Running over the club-moss burrs;
I inhaled the violet's breath;
Around me stood the oaks and firs;
Pine cones and acorns lay on the ground;
Over me soared the eternal sky,
Full of light and of deity;
Again I saw, again I heard
The rolling river, the morning bird:
Beauty through all my senses stole;
I yielded myself to the perfect whole."

But again, here Mrs. Browning, speaking by the mouth of Adam in "The Drama of Exile," so far identifies beauty and *love* as to make the former depend on the latter; insomuch that Satan, created the most beautiful of all angels, becomes the most repulsive of all angels from lack of *love*, though retaining all his original outfit of beauty. In "A Drama of Exile," after Adam and Eve have become wise with the great lessons of grief, love, and forgiveness, to them comes Satan, with such talk as if he would mock them back into their misery; but it is fine to see how the father of men now instructs the prince of the angels upon this matter of love and beauty.

EVE. Speak no more with him,
Beloved! it is not good to speak with him.
Go from us, Lucifer, and speak no more!
We have no pardon which thou dost not scorn,
Nor any bliss, thou seest, for coveting,
Nor innocence for staining. Being bereft,
We would be alone. — Go.
LUC. Ah! ye talk the same,
All of you — spirits and clay — go, and depart!
In Heaven they said so; and at Eden's gate, —
And here, reiterant, in the wilderness.
None saith, Stay with me, for thy face is fair!
None saith, Stay with me, for thy voice is sweet!
And yet I was not fashioned out of clay.
Look on me, woman! Am I beautiful?
EVE. Thou hast a glorious darkness.
LUC. Nothing more?
EVE. I think, no more.
LUC. False Heart — thou thinkest more!
Thou canst not choose but think * * *
* * * that I stand
Most absolute in beauty. As yourselves
Were fashioned very good at best, so *we*
Sprang very beauteous from the creant Word
Which thrilled behind us, God Himself being moved
When that august work of a perfect shape, —
His dignities of sovran angel-hood, —
Swept out into the Universe, — divine
With thunderous movements, earnest looks of gods,
And silver-solemn clash of cymbal-wings!
Whereof was I, in motion and in form,
A part not poorest. And yet, — yet, perhaps,
This beauty which I speak of is not here,
As God's voice is not here, nor even my crown —
I do not know. What is this thought or thing
Which I call beauty? is it thought or thing?
Is it a thought accepted for a thing?
Or both? or neither? — a pretext — a word?
Its meaning flutters in me like a flame
Under my own breath: my perceptions reel
For evermore around it, and fall off,
As if it too were holy.
EVE. Which it is.
ADAM. The essence of all beauty, I call love.
The attribute, the evidence, and end,
The consummation to the inward sense,
Of beauty apprehended from without,
I still call love. As form, when colorless,
Is nothing to the eye, — that pine-tree there,
Without its black and green, being all a blank, —
So, without love, is beauty undiscerned,
In man or angel. Angel! rather ask
What love is in thee, what love moves to thee,
And what collateral love moves on with thee;
Then shalt thou know if thou art beautiful.
LUC. Love! What is love? I lose it. Beauty and love.
I darken to the image. Beauty — love.
(He disappears.)

Let us now carry forward this connection between love and beauty in listening to a further testimony of Emerson's in a poem called "The Celestial Love," where, instead of identifying *beauty* and *truth* with Keats, we find him making *love* and *truth* to be one:

"Love's hearts are faithful, but not fond,
Bound for the just, but not beyond;
Not glad, as the low-loving herd,
Of self in other still preferred,
But they have heartily designed
The benefit of broad mankind.
And they serve men austerely,
After their own genius, clearly,
Without a false humility;
For this is Love's nobility, —
Not to scatter bread and gold,
Goods and raiment bought and sold;
But to hold fast his simple sense,
And speak the speech of innocence,
And with hand, and body, and blood,
To make his bosom-counsel good.
For he that feeds men serveth few;
He serves all who dares be true."

And in connection with these lines, —

"Not glad, as the low-loving herd,
Of self in other still preferred," —

I must here beg you to observe the quite incalculable advance in the ideal of love here presented by Emerson, and the ideal which was thought to be the crown and boast of the classic novel a hundred years ago, and which is still pointed to with exultation by thoughtless people. This ideal, by universal voice, was held to have been consummated in the character of Squire Allworthy, in the famous novel, "Tom Jones." And here it is: We have a dramatic presentation of Squire Allworthy, early on a May morning pacing the terrace before his mansion, which commanded a noble stretch of country; and then Fielding glows thus:

"In the full blaze of his majesty rose the sun, than which one object alone in this lower creation

could be more glorious, and that Mr. Allworthy himself presented—a human being replete with benevolence, meditating in what manner he might render himself most acceptable to his Creator by doing most good to His creatures."

Here, Mr. Allworthy's benevolence has for its object to render himself most acceptable to his Creator. His love, in other words, is only another term for increasing his account in the Bank of Heaven—a perfect example, in short, of that love of the low-loving herd which is self in other still preferred.

But now let me once more turn the tube and gain another radiant arrangement of these kaleidoscopic elements, beauty and love and the like. In Emerson's poem called "Beauty" (which must be distinguished from the "Ode to Beauty"), the relation between love and beauty takes this turn: of Seyd he says:

> "Beauty chased he everywhere.
> In flame, in storm, in clouds of air.
> He smote the lake to feed his eye
> With the beryl beam of the broken wave;
> He flung in pebbles well to hear
> The moment's music which they gave.
> Oft pealed for him a lofty tone
> From nodding pole and belting zone.
> He heard a voice none else could hear
> From central and from errant sphere.
> The quaking earth did quake in rhyme,
> Seas ebbed and flowed in epic chime.
> In dens of passion, and pits of woe,
> He saw strong Eros struggling through,
> To sum the doubt and solve the curse,
> And beam to the bounds of the universe.
> While thus to love he gave his days
> In loyal worship, scorning praise,"

(where, you observe, love is substituted for beauty, as that to which he gave his days, in the most naïve *assumption* that the one involves the other,)

> "While thus to love he gave his days
> In loyal worship, scorning praise,
> How spread their lures for him in vain
> Thieving Ambition and paltering Gain!
> He thought it happier to be dead,
> To die for Beauty, than live for bread."

George Eliot has somewhere called this word love a word-of-all-work. If, with another turn, I add to these testimonies one from Swedenborg, in which this same love—which we have just seen to be beauty—which beauty we just before saw to be truth—is now identified with *wisdom*, we prove the justice of George Eliot's phrase. In section X. of his work on "The Divine Providence," Swedenborg says: "The good of love is not good any further than it is united to the truth of wisdom; and the truth of wisdom is not truth any further than it is united to the good of love"; and he continues, in section XIII.: "Now, because truth is from good, as wisdom is from love, therefore both taken together are called love or good: for love in its form is wisdom, and good in its form is truth."

And, finally, does not David practically confirm this view where, in Psalms, CXIX., he involves the love of the law of God with wisdom in the verse, "I understand more than the ancients because I keep thy precepts?"

I grieve that there is no time to call more witnesses; for I love to assemble these lofty spirits and hear them speak upon one topic. Is it not clear that in the minds of these serious thinkers truth, beauty, wisdom, goodness, love appear as if they were but avatars of one and the same essential God? And if this be true, cannot one say with authority to the young artist,—whether working in stone, in color, in tones, or in character—forms of the novel: So far from dreading that your moral purpose will interfere with your beautiful creation, go forward in the clear conviction that, unless you are suffused—soul and body, one might say—with that moral purpose which finds its largest expression in love—that is, the love of all things in their proper relation—unless you are suffused with this love, do not dare to meddle with beauty; unless you are suffused with beauty, do not dare to meddle with love; unless you are suffused with truth, do not dare to meddle with goodness,—in a word, unless you are suffused with beauty, truth, wisdom, goodness, *and* love, abandon the hope that the ages will accept you as an artist.

Of course, I leave out of view here all that field of artistic activity which is merely neutral, which is—not immoral, but—merely *unmoral*. The situations in Scott's novels, for instance, do not in general put us upon any moral question as between man and man. Or when our own Mr. Way paints his luminous bunches of grapes, one of which will feed the palates of a thousand souls though it is never eaten, and thus shows us how Art repeats the miracle of the loaves and fishes, feeding a multitude and leaving more of the original provision than was at first, we have most delightful unmoral art. This is not only legitimate, but I think among the most beneficent energies of art; it rests our hearts, it gives us holiday from the eternal debate, it re-creates us for all work.

But now, secondly, as to the influence of moral purpose in art: we have been in the habit, as you will remember, of passing at the earliest possible moment from abstract discussion to the concrete instance; and if we now follow that course and inquire—not whether moral purpose *may* interfere with artistic creation, but whether moral purpose *has* interfered with artistic creation, as matter of fact, in the works of those whom the ages have set

in the highest heaven of art, we get a verdict which seems to leave little room for question. At the beginning we are met with the fact that the greatest work has always gone hand in hand with the most fervent moral purpose. For example, the most poetical poetry of which we know anything is that of the author of Job and that of David and of his fellow psalm-writers. I have used the expression "most poetical" here with design: for, regarded as pure literature, these poems, in this particular of poeticalness, of pure spirituality, lift themselves into a plane not reached by any others. A single fact in proof of this exceeding poeticalness will suffice: it is the fact that these poems alone, of all ever written, bear translation from one language into another without hurt. Surely this can be said of no other poetic work. If we strike away all allowances of amateurishness and good-fellowship, and judge with the uncompromising truth of the pious artist, how pitiful is Homer as he appears even in Pope's English; or how subtly does the simplicity of Dante melt into childishness even with Mr. Longfellow guiding; or how tedious and flat fall the cultured sentences of Goethe even in Taylor's version, which has by many been declared the most successful translation ever made, not only of "Faust," but of any foreign poem; nay, how completely the charm of Chaucer exhales away, even when redacted merely from an older dialect into a later one, by hands so skillful as those of Dryden and Wordsworth!

Now, it is words and their associations which are untranslatable, not ideas; there is no *idea*, whether originating in a Hebrew, Greek, or other mind, which cannot be adequately produced as idea in English words. The reason why Shakspere and Dante are practically untranslatable is that, recognizing how every word means more than itself to its native users,—how every word is like the bright head of a comet drawing behind it a less luminous train of vague associations, which are associations only to those who have used such words from infancy,—Shakspere and Dante, I say, have used this fact and have constructed poems which necessarily mean more to native hearers than they can possibly mean to any foreign ear.

But this Hebrew poetry which I have mentioned is so purely composed of ideas which are universal, essential, fundamental to the personality of man, instantly recognizable by every soul of every race, that they remain absolutely great, absolutely artistic, in whatever language they are couched. For example,—if one climbs up for a moment out of that vagueness with which Biblical expressions, for various reasons, are apt to fall upon many ears, so that one may consider the clean and virgin quality of ideas clarified from all factitious charm of word and of association,—what could be more nearly perfect as pure literature than this:

"The entrance of thy words giveth light; it giveth understanding unto the simple.

I opened my mouth and panted: for I longed for thy commandments * * *

Deliver me from the oppression of man: so will I keep thy precepts.

Order my steps in thy word, and let not any iniquity have dominion over me.

Make thy face to shine upon thy servant, and teach me thy statutes.

Rivers of waters run down mine eyes because they keep not thy law."

Or this:

"I will lift up mine eyes to the hills whence cometh my help.

My help cometh from the Lord which made heaven and earth. * * *

The Lord is thy keeper: the Lord is thy shade upon thy right hand.

The sun shall not smite thee by day, nor the moon by night.

The Lord shall preserve thee from all evil: He shall preserve thy soul.

The Lord shall preserve thy going out and thy coming in from this time forth, even for evermore."

Or this:

"In my distress I cried unto the Lord, and He heard me.

Deliver my soul, O Lord, from lying lips, from a deceitful tongue.

What shall be given unto thee, or what shall be done unto thee, thou false tongue!

Sharp arrows of the mighty with coals of juniper.

Woe is me that I sojourn in Mesech, that I dwell in the tents of Kedar!

My soul hath long dwelt with him that hateth peace.

I am for peace; but when I speak they are for war."

Or this of Isaiah's.

"Then the eyes of the blind shall be opened and the ears of the deaf unstopped. Then shall the lame leap as an hart, and the tongue of the dumb sing: for in the wilderness shall waters break out, and streams in the desert. And the parched ground shall become a pool, and the thirsty land springs of water.

In the habitation of dragons where each lay shall be grass with reeds and rushes. * * * No lion shall be there, nor any ravenous beast shall go up thereon; it shall not be found there; * *

And the ransomed of the Lord shall return and come to Zion with songs and everlasting joy upon their heads: they shall obtain joy and gladness, and sorrow and sighing shall flee away."

Or this from the author of "Job":

"Surely there is a vein for the silver and a place for gold where they fine it. * * *

As for the earth, out of it cometh bread, and under it is turned up as it were fire. * * *

But where shall wisdom be found? And where is the place of understanding? * * *

The depth saith, It is not in me: and the sea saith, It is not with me. * * *

Destruction and death say, We have heard the fame thereof with our ears.

God understandeth the way thereof, and he knoweth the place thereof.

For he looketh to the ends of the earth, and seeth under the whole heaven; * * *

When he made a decree for the rain and a way for the lightning of the thunder:

Then did he see it and declare it; he prepared it, yea, and searched it out.

And unto man he said, Behold, the fearof the Lord, that is wisdom; and to depart from evil is understanding."

Here it is apparent enough that the moral purpose with which these writers were, beyond all question, surcharged, instead of interfering with the artistic value of their product, has spiritualized the art of it into an intensity which burns away all limitations of language, and sets their poems as indestructible monuments in the hearts of the whole human race.

If we descend to the next rank of poetry, I have only to ask you to observe how, in Shakspere, just as the moral purpose becomes loftier the artistic creations become lovelier. Compare, for example, the forgiveness and reconcilation group of plays, as they have been called—"The Winter's Tale," "Henry VIII.," and "The Tempest" (which must have been written late in Shakspere's life, when the moral beauty of large forgiveness seems to have taken complete possession of his fancy, and when the moral purpose of displaying that beauty to his fellow-men seems to have reigned over his creative energy)—compare, I say, these plays with earlier ones, and it seems to me that all the main creations are more distinctly artistic, more spiritually beautiful, lifted up into a plane of holy ravishment which is far above that of all the earlier plays. Think of the dignity and endless womanly patience of *Hermione*, of the heavenly freshness and morning quality of *Perdita*, of the captivating roguery of *Autolycus*, in "The Winter's Tale"; of the colossal forgiveness of *Queen Katherine*, in "Henry VIII."; of the equally colossal pardon of *Prospero*, of the dewy innocence of *Miranda*, of the gracious and graceful ministrations of *Ariel*, of the grotesquerie of *Caliban* and *Trinculo*, of the play of ever fresh delights and surprises which make the drama of "The Tempest" itself a lone and music-haunted island among dramas! Everywhere in these latter plays I seem to feel the brooding of a certain sanctity which breathes out of the larger moral purpose of the period.

Leaving these illustrations, for which time fails, it seems to me we have fairly made out our case against these objectors if, after this review of the connection between moral purpose and artistic creation, we advance, thirdly, to the fact of which these objectors seem profoundly oblivious—that the English novel at its very beginning announces itself as the vehicle of moral purpose. Richardson and Fielding, the first English novelists, carefully sheltered their works behind the claim of this very didacticism. Everywhere in "Pamela," "Clarissa Harlowe," "Tom Jones,"—in the preface, sometimes in the very title-page,—it is ostentatiously set up that the object of these books is to improve men's *moral* condition by setting before them plain examples of vice and virtue. Passing by, therefore, the grinning absurdity of the "Saturday Review's" declaration that the proper office of the novelist is to amuse, and that when George Eliot pretended to do more, and to instruct, she necessarily failed to do either,—it is almost as odd to find that the very objectors who urge the injurious effect of George Eliot's moral purpose upon her work are people who swear by Richardson and Fielding, utterly forgetting that if moral purpose is a detriment to "Daniel Deronda," it is simple destruction to "Clarissa Harlowe" and "Tom Jones."

When I think of the crude and hasty criticism which confines this moral purpose in "Daniel Deronda" to the pushing forward of Deronda's so-called religious patriotism, in endeavoring to reëstablish his people in the ancient seat of the Hebrews,—a view which I call crude and hasty, because it completely loses sight of the much more prominent and important moral purpose of the book, namely, the setting forth of Gwendolen Harleth's repentance,—when, I say, I hear these critics not only assume that Deronda's mission is *the* moral purpose of this book, but even belittle that by declaring that George Eliot's enthusiasm for the rehabilitation of the Jews must have been due to a chance personal acquaintance of hers with some fervid Jew who led her off into these chimerical fancies, and when I find this tone prevailing, not only with the Philistines, but among a great part of George Eliot's otherwise friends and lovers, then I am in a state of amazement which precludes anything like critical judgment on my part. As for me, no Jew,—not even the poorest shambling clothes-dealer in Harrison street—but startles me effectually out of this work-a-day world. When I look upon the face of a Jew, I seem to feel a little wind fresh from off the Sea of Tiberias; I seem to receive a message which has come under the whole Sea of Time from the further shore of it. This wandering person, who without a home in any nation, has yet

made a literature which is at home in every nation, carries me in one direction to my mysterious brethren, the cave-men and the lake-dwellers, in the other direction to the Masterful Carpenter of Bethlehem, climax of our race.

Until you can bring me a statesman more comprehensive in view and more diligent in detail than Moses, until you can bring me poets more spiritual than David and him who wrote Job, until you can bring me a lover more pure or a mystic more rapt than John, until you can bring me a man more dear and friendly and helpful and strong and human and Christly than Jesus,—do not speak to me slightingly of the Jew. And now, to gather together these people from the four ends of the earth; to rehabilitate them in their thousand-fold consecrated home after so many ages of wandering; to remake them into a homologous nation, at once the newest and the oldest upon earth; to endow the nineteenth century with that prodigious momentum which all the old Jewish fervor and spirituality and tenacity would acquire in the backward spring from such long ages of restraint and oppression, and with the mighty accumulation of cosmopolitan experiences,—the bare suggestion would seem enough to stir the blood of the most ungentle Gentile. And if, anticipating a certain shame in their attitude, these objectors add that Deronda's mission was chimerical, I reply that, since we have seen the telegraph and the railway and the photophone, and Benjamin Disraeli prime minister of England, the word chimerical has ceased to have a meaning. Somewhere in this very book we are discussing George Eliot says: "There is a sort of human paste that when it comes near the fire of enthusiasm is only baked into harder shape." Such seem to me those who remain sardonically unaffected by the idea of Jewish restoration. As for me, the movement seems so noble and captivating that to fail in it appears finer than to succeed in most of the promising projects of this world; and one almost wishes one were a Jew, that one might begin it without loss of time.

Sidney Lanier.

AT TEAGUE POTEET'S.

A SKETCH OF THE HOG MOUNTAIN RANGE.

BY JOEL CHANDLER HARRIS,

Author of "Uncle Remus, His Songs and Sayings," etc.

IN TWO PARTS: PART I.

EMIGRATION is a much more serious matter than revolution. Virtually, it is obliteration. Thus, Gérard Petit, landing upon the coast of South Carolina in the days of French confusion—a period covering too many dates for a romancer to be at all choice in the matter—gave his wife and children over to the oblivion of a fatal fever. Turning his face westward, he pushed his way to the mountains. He had begun his journey fired with the despair of an exile, and he ended it with something of the energy and enterprise of a pioneer. In the foot-hills of the mountains he came to the small stream of English colonists that was then trickling slowly southward through the wonderful valleys that stretch from Pennsylvania to Georgia, between the foot-hills of the Blue Ridge and the great Cumberland Range. Here, perhaps for the first time, the *je*, *vous*, *nous* of France met in conflict the "ah yi," the "we uns" and the "you uns" of the English-Pennsylvania-Georgians. The conflict was brief. There was but one Gérard Petit, and, although he might multiply the *je*, *vous*, *nous* by the thousands and hundreds of thousands, as he undoubtedly did, yet, in the very nature of things, the perpetual volley of "you uns" and "we-uns" must carry the day. They belonged to the time, and the climate suited them. By degrees they fitted themselves to Gérard Petit; they carried him from the mountains of South Carolina to the mountains of North Georgia, and there they helped him to build a mill and found a family. But their hospitality did not end there. With the new mill and the new family, they gave him a new name. Gérard Petit, presumably with his hand upon his heart, as became his race, made one last low bow to genealogy. In his place stood Jerd Poteet, "you uns" to the left of him, "we uns" to the right of him. He made such protest as he might. He brought his patriotism to bear upon the emergency, and named his eldest son Huguenin Petit. How long this contest between hospitality on the one hand and family pride and patriotism on the other was kept up, it is unnecessary to inquire. It is enough to say that the Huguenin of one generation left Hugue

Poteet as his son and heir; Hugue left Hague, and this Hague, or a succeeding one, by some mysterious development of fate, left Teague Poteet.

Meanwhile the restless stream of English-Pennsylvania-Georgians, with its "you uns" and its "we uns," trickled over into Alabama, where some of the Petits who were carried with it became Pettys and Pettises. The Georgia settlements, however, had been reënforced by Virginians, South Carolinians, and Georgians. The gold excitement brought some; while others, set adrift by the exigencies of the plantation system, found it easier and cheaper to get to North Georgia than to reach Louisiana or Mississippi. Thus, in 1859, Teague Poteet, a young man of thirty or thereabouts, was tilling, in a half-serious, half-jocular way, a small farm on Hog Mountain, in full view of Gullettsville. That is to say, Poteet could see the whole of Gullettsville, but Gullettsville could not, by any means, see the whole, nor even the half, of Poteet's fifty-acre farm. Gulletsvillle could see what appeared to be a gray notch on the side of the mountain, from which a thin stream of blue smoke flowed upward and melted into the blue of the sky, and this was about all that could be seen. Gullettsville had the advantage in this, that it was the county-seat. A country-road, straggling in from the woods, straggled around a barn-like structure called the court-house, and then straggled off to some other remote and lonely settlement.

Upon rare occasions Teague made his appearance on this straggling street, and bought his dram and paid his thrip for it; but, in a general way, if Gullettsville wanted to see him, it had to search elsewhere than on the straggling street. By knocking the sheriff of the county over the head with a chair, and putting a bullet through a saloon-keeper who bullied everybody, Poteet won the reputation of being a man of marked shrewdness and common sense, and Gullettsville was proud of him, in a measure. But he never liked Gullettsville. He wore a wool hat, a homespun shirt, jeans pantaloons, and cotton suspenders, and he never could bring himself into thorough harmony with the young men who wore ready-made clothes, starched shirts, and beaver hats; nor was his ideal of feminine beauty reached by the village belles, with their roach-combs, their red and yellow ribbons, and their enormous flounces. In the mountains, he was to the manner born; in the village, he was keenly alive to the presence and pressure of the exclusiveness that is the basis of all society, good bad, or indifferent; and it stirred his venom. His revolt was less pronounced and less important than that of his ancestors; but it was a revolt. Gérard Petit left France, and Teague Poteet remained away from Gullettsville. Otherwise there was scarcely a trace of his lineage about him, and it is a question whether he inherited this trait from France or from the Euphrates—from Gérard or from Adam.

But he did not become a hermit by any means. The young men of Gullettsville made Sunday excursions to his farm, and he was pleased to treat them with great deference. Moreover, he began to go upon little journeys of his own across Sugar Valley. He made no mystery of his intentions; but one day there was considerable astonishment when he rode into Gullettsville on horseback, with Puss Pringle behind him, and informed the proper authorities of his desire to make her Mrs. Puss Poteet. Miss Pringle was not a handsome woman, but she was a fair representative of that portion of the race that has poisoned whole generations by improving the frying-pan and perpetuating "fatty bread." The impression she made upon those who saw her for the first time was one of lank flatness —to convey a vivid idea rather clumsily. But she was neither lank nor flat. The total absence of all attempts at artificial ornamentation gave the future Mrs. Poteet an appearance of forlorn shiftlessness that was not even slightly justified by the facts. She was a woman past the heyday of youth, but of considerable energy, and possessed of keen powers of observation. Whatever was feminine about her was of that plaintive variety which may be depended upon to tell the story of whole generations of narrow toilsome, and unprofitable lives.

There was one incident connected with Miss Pringle's antenuptial ride that rather intensified the contempt which the Mountain entertained for the Valley. As she jogged down the street, clinging confidently, if not comfortably, to Teague Poteet's suspenders, two young ladies of Gullettsville chanced to be passing along. They walked slowly, their arms twined about each other's waists. They wore white muslin dresses, and straw hats with wide and jaunty brims, and the loose ends of gay ribbons fluttered about them. These young ladies, fresh from school, and no doubt full of vainglory, greeted the bridal procession with a little explosion of giggles, and when Puss Pringle pushed back her gingham sun-bonnet and innocently gazed upon them, they turned up their noses, sniffed the air scornfully, and made such demonstrations as no feminine mind, however ignorant in other directions, could fail to interpret.

Miss Pringle had not learned the art of tossing her head and sniffing the air, but she half closed her eyes, and gave the young

ladies a look that meant something more than scorn. She said nothing to Teague, for she was in hopes he had not observed the tantrums of the school-girls.

As for Teague, he saw the whole affair, and was cut to the quick. In addition to the latent pride of his class, he inherited the sensitiveness of his ancestors but, turning his eyes neither to the right nor to the left, he jogged along to the wedding. He carried his wife home, and thereafter avoided Gullettsville. When he was compelled to buy coffee and sugar, or other necessary luxuries, he rode forty miles across the mountain to Villa Ray.

He had been married a year or more when, one afternoon, he was compelled to ride down to Gullettsville under whip and spur for a doctor. There was a good deal of confused activity in the town. Old men and young boys were stirring around with blue cockades in their hats, and the women wore blue rosettes on their bosoms. Three negroes in uniform — a contribution from the nearest railroad town — were parading up and down the straggling street with fife and drums, and a number of men were planting a flag-pole in front of the court-house.

No conscientious historian can afford to ignore a coincidence, and it so happened that upon the very day that Teague Poteet's wife presented him with the puzzle of a daughter, Fate presented his countrymen with the problem of war. That night, sitting in the door of his house and smoking his pipe, Teague witnessed other developments of the coincidence. In the next room, the baby-girl squalled most persistently; down in the valley the premonitions of war made themselves heard through the narrow throat of a small cannon which, until then, had been used only to celebrate the Fourth of July.

The noise of a horse's hoofs roused Teague's hounds, and some one called out from the road:

"Hello, Poteet!"

"Ah-yi!"

"You hearn the racket?"

"My gal-baby keeps up sich a hollerin' I can't hear my own years."

"*Oh!*"

"You better b'lieve! Nine hours ole, an' mighty peart. What's them Restercrats in the valley cuttin' up the'r scollops fer?"

"Whoopin' up se*say*sion. Sou' Ca'liny done plum gone out, an' Georgy a-gwine."

Teague Poteet blew a long, thin cloud of home-made tobacco-smoke heavenward, leaned back heavily in his chair, and replied:

"Them air Restercrats kin go wher' they dang please; I'm a gwine to stay right slambang in the United States."

There was a little pause, as if the man on horseback was considering the matter. Then the response came:

"Here's at you!"

"Can't you 'light?" asked Poteet.

"Not now," said the other; "I'll git on furder."

The man on horseback rode on across the mountain to his home. Another mountaineer, seeing the rockets and hearing the sound of the cannon, came down to Poteet's for information. He leaned over the brush-fence.

"What's up, Teague?"

"Gal-baby; reg'lar surbinder."

"*Shoo!* won't my ole 'oman holler! What's up down yan?"

"Them dad-blasted Restercrats a secedin' out'n the United States."

"They say theyer airter savin' of the'r niggers," said the man at the fence.

"Well, I hain't got none, and I hain't a wantin' none; an' it hain't been ten minnits sense I ups an' says to Dave Hightower, s'I 'the United States is big enough for me.'"

"Now you er makin' the bark fly," said the man at the fence.

During the night other men came down the mountain as far as Poteet's, and always with the same result.

The night broadened into day, and other days and nights followed. In the valley, the people had their problem of war, and on the mountain, Teague Poteet had the puzzle of his daughter. One was full of doubt and terror, and death, and the other full of the pleasures of peace. As the tide of war surged nearer and nearer, and the demand for recruits became clamorous, the people of the valley bethought them of the gaunt but sturdy men who lived on the mountain. A conscript officer, representing the necessities of a new government, made a journey thither — a little excursion full of authority and consequence. As he failed to return, another officer, similarly equipped and commissioned, rode forth and disappeared, and then another and another; and it was not until a little search expedition had been fitted out that the Confederates discovered that the fastnesses of Hog Mountain concealed a strong and dangerous organization of Union men. There was a good deal of indignation in the valley when this state of affairs became known, and there was some talk of organizing a force for the purpose of driving the mountaineers away from their homes. But somehow the Valley never made up its mind to attack the Mountain, and, upon such comfortable terms as these, the Mountain was very glad to let the Valley alone.

After awhile the Valley had larger troubles

to contend with. Gullettsville became in some measure a strategic point, and the left wing of one army and the right wing of the other maneuvred for possession. The left wing finally gave way, and the right wing marched in and camped round about, introducing to the distracted inhabitants General Tecumseh Sherman and some of his lieutenants. The right wing had learned that a number of Union men were concealed on the mountain, and one or two little excursion parties were made up for the purpose of forming their acquaintance. These excursions were successful to this extent, that some of the members thereof returned to the friendly shelter of the right wing with bullet-holes in them, justly feeling that they had been outraged. The truth is, the Poteets, and the Pringles, and the Hightowers of Hog Mountain had their own notions of what constituted Union men. They desired to stay in the United States on their own terms. If nobody pestered them, they pestered nobody.

Meanwhile, Teague Poteet's baby had grown to be a thumping girl, and hardly a day passed that she did not accompany her father in his excursions. When the contending armies came in sight, Teague and his comrades spent a good deal of their time in watching them. Each force passed around an elbow of the mountain, covering a distance of nearly sixty miles, and thus for days and weeks this portentous panorama was spread out before these silent watchers. Surely never before did a little girl have two armies for her playthings. The child saw the movements of the soldiers, the glitter of the array, and the waving of the banners; she heard the dull thunder of the cannon, and the sharp rattle of the musketry. When the sun went down, and the camp-fires shone out, it seemed that ten thousand stars had fallen at her feet, and sometimes sweet strains of music stole upward on the wings of the night, and slipped heavenward through the sighing pines.

The gray columns swung right and left, and slowly fell back; the blue columns swayed right and left, and slowly pressed forward,—sometimes beneath clouds of sulphurous smoke, sometimes beneath heavy mists of rain, sometimes in the bright sunshine. They swung and swayed slowly out of sight, and Hog Mountain and Gullettsville were left at peace.

The child grew and thrived. In the midst of a gaunt and sallow generation, she shone radiantly beautiful. In some mysterious way, she inherited the beauty, and grace, and refinement of a Frenchwoman. Merely as a phenomenon, she ought to have reminded Teague of his name and lineage; but Teague had other matters to think of. "Sis aint no dirt-eater," he used to say, and to this extent only would he commit himself, his surroundings having developed in him that curious excess of caution and reserve which characterizes his class.

As for Puss Poteet, she sat and rocked herself and rubbed snuff, and regarded her daughter as one of the profound mysteries. She was in a state of perpetual bewilderment and surprise, equaled only by her apparent indifference. She allowed herself to be hustled around by Sis without serious protest, and submitted, as Teague did, to the new order of things as quietly as possible.

Meanwhile, the people in the valley were engaged in adjusting themselves to the changed condition of affairs. The war was over, but it had left some deep scars here and there, and those who had engaged in it gave their attention to healing these—a troublesome and interminable task, be it said, which by no means kept pace with the impatience of the victors, whipped into fury by the subtle but ignoble art of the politician. There was no lack of despair in the valley, but out of it all prosperity grew, and the promise of a most remarkable future. Behind the confusion of politics, of one sort and another, the spirit of Progress rose and shook her ambitious wings.

Something of all this must have made itself telt on the mountain, for one day Teague Poteet pushed his wide-brimmed wool hat from over his eyes, with an air of astonishment. Puss had just touched upon a very important matter.

"I reckon in reason," she said, "we oughter pack Sis off to school some'rs. She'll thes nat'ally spile here."

"Haint you larnt her how to read an' write an' cipher?" asked Teague.

"I started in," said Mrs. Poteet, "but, Lord! I haint more'n opened a book tell she know'd more'n I dast to know ef I wuz gwine to die fer it. Hit'll take somebody lots smarter'n' stronger'n me."

Teague laughed and then relapsed into seriousness. After awhile he called Sis. The girl came running in, her dark eyes flashing, her black hair bewitchingly tangled, and her cheeks flushing with a color hitherto unknown to the mountain.

"What now, pap?"

"I wuz thes a-thinkin' ef maybe you oughtn't to bresh up an' start to school down in Gullettsville."

"Oh, pap!" the girl exclaimed, clapping her hands with delight. She was about to spring upon Teague and give him a severe hugging, when suddenly her arms dropped

to her side, the flush died out of her face, and she flopped herself down upon a chair. Teague paid no attention to this.

"Yes, siree," he continued, as if pursuing a well-developed line of argument; "when a gal gits ez big ez you is, she haint got no business to be a-gwine a-whoopin' an' a-hollerin' an' a-rantin' an' a-rompin' acrost the face er the yeth. The time's done come when they oughter be tuck up an' made a lady out'n; an' the nighest way is to sen' 'em to school. That's whar yous a-gwine — down to Gullettsville to school."

"I shan't, an' I wont — I wont, I wont, *I wont!*" exclaimed Sis, clenching her hands and stamping her feet. "I'll *die* first."

Teague had never seen her so excited.

"Why, what's the matter, Sis?" he asked, with unfeigned concern.

Sis gave him a withering look.

"Pap, do you reckon I'm fool enough to traipse down to Gullettsville an' mix with them people, wearin' cloze like these? Do you reckon I'm fool enough to make myself the laughin'-stock for them folks?"

Teague Poteet was not a learned man, but he was shrewd enough to see that the Mountain had a new problem to solve. He took down his rifle, whistled up his dogs, and tramped skyward. As he passed out through his horse-lot, a cap and worm of a whiskey-still lying in the corner of the fence attracted his attention. He paused and turned the apparatus over with his foot. It was old and somewhat battered.

"I'll thes about take you," said Teague, with a chuckle, "an' set up a calico-factory. I'll heat you up an' make you spin silk an' split it into ribbens."

It was a case of civilization or no civilization, and there is nothing more notorious in history — nothing more mysterious — than the fact that civilization is not over-nice in the choice of her handmaidens. One day it is war, another it is slavery. Every step in the advancement of the human race has a paradox of some kind as a basis. In the case of Sis Poteet, it was whisky.

Teague got his still together and planted it in a nice cool place, where it could be reached only by a narrow foot-path. He had set up a still immediately after the war, but it had been promptly broken up by the revenue officers. Upon this occasion, therefore, he made elaborate preparations to guard against surprise and detection, and these preparations bore considerable fruit in the way of illicit whisky; the ultimate result of which was that Sis went to school in Gullettsville, and became the belle of the town.

The breath of the mountain was heavily charged with whisky, and the Government got a whiff of it. Word went to Washington, and there was much writing and consulting by mail, and some telegraphing. The officials — marshal, deputy marshals, and collector — were mostly men from a distance, brought hither on the tide of war, who had no personal interest in judging the situation. Naturally enough, the power with which they were invested was neither discreetly nor sympathetically exercised. They represented the Government, which, they were taught to believe by the small men above them, was still at war with every condition and belief in Georgia.

Down in the valley they domineered with impunity, and one fine morning a posse, armed with carbines, rode up the mountain, laughing, talking, and rattling their gear as gayly as a detachment of cuirassiers parading under the protection of friendly guns. The mountain was inhospitable, for when they rode down again, a few hours afterward, three saddles were empty, and the survivors had a terrible story to tell of an attack from an unseen foe.

By the time the story of this fight with the illicit distillers reached Washington, the details were considerably enlarged. The commissioner was informed by the marshal that a detail of deputy marshals had attempted to seize a still, and were driven back by an overpowering force. The correspondents at the Capital still further enlarged the details, and the affair finally went into history as "A New Phase of the Rebellion." This was the natural outgrowth of the confusion of that period; for how should the careless deputy marshals, thinking only of the sectionalism that lit up the smoldering ruins of war, know that the Moonshiners were Union men and Republicans?

While the Government was endeavoring to invent some plan for the capture of the Moonshiners, Sis Poteet was growing lovelier every day. She was a great favorite with the teachers of the academy and with everybody. As a general thing she avoided the public square when riding to and from the school, but it was hats off with all the men when she did go clattering down the street, and some of the romantic dry-goods clerks sent their sighs after her. Sighs are frequently very effective with school-girls, but those that followed Sis Poteet fell short and were wasted on the air; and she continued to ride from the mountain to the valley and from the valley to the mountain in profound ignorance of the daily sensation she created among the young men of Gullettsville, to whom her fine figure, her graceful ways, and her thrillingly

beautiful face were the various manifestations of a wonderful revelation.

Naturally enough, the Government took no account of Sis Poteet. The commissioner at Washington conferred with the marshal for Georgia by mail, and begged him to exert himself to the utmost to break up the business of illicit distilling in the Hog Mountain Range. In view of an important election about to be held in some doubtful State in the North or West, the worthy commissioner at Washington even suggested the propriety of another armed raid, to be made up of deputy marshals and a detachment of men from the Atlanta garrison. But the marshal for Georgia did not fall in with this suggestion. He was of the opinion that if a raid was to be made at all it should not be made blindly, and he fortified his opinion with such an array of facts and arguments that the Bureau finally left the whole matter to his discretion.

Early one morning, in the summer of 1879, a stranger on horseback rode up the straggling red road that formed the principal business thoroughfare of Gullettsville and made his way toward the establishment known as the Gullettsville Hotel. The chief advertisement of the hotel was the lack of one. A tall, worm-eaten post stood in front of the building, but the frame in which the sign had swung was empty. This post, with its empty frame, was as significant as the art of blazonry could have made it. At any rate, the stranger on horseback—a young man—pressed forward without hesitation. The proprietor himself, Squire Lemuel Pleasants, was standing upon the low piazza as the young man rode up. The squire wore neither coat nor hat. His thumbs were caught behind his suspenders, giving him an air of ease or of defiance, as one might choose to interpret, and his jaws were engaged in mashing into shape the first quid of the morning.

As the young man reined up his horse at the door, Squire Pleasants stepped briskly inside and pulled a string which communicated with a bell somewhere in the back-yard.

"This is the Gullettsville Hotel, is it not?" the young man asked.

"Well, sir," responded the squire, rubbing his hands together, "sence you push me so clos't, I'll not deny that this here's the tavern. Some calls it the hotel, some calls it the Pleasants House, some one thing, an' some another, but as for me, I says to all, says I, 'Boys, it's a plain tavern.' In Fergeenia, sir, in my young days, they wa'nt nothin' better than a tavern. 'Light, sir, 'light," continued the hospitable squire, as a tow-headed stable-boy tumbled out at the door in response to the bell; "drap right down an' come in."

The young man followed the landlord into a bare little office, where he was given to understand in plain terms that people who stopped with Squire Pleasants were expected to make themselves completely at home. With a pen upon which the ink had been dry for many a day the young man inscribed his name on a thin and dirty register—"Philip Woodward, Clinton, Georgia"; whereupon the squire, with unnecessary and laborious formality, assigned Mr. Woodward to a room.

Judging from appearance, the United States Marshal for Georgia had not gone astray in selecting Woodward to carry out the delicate mission of arranging for a successful raid upon Hog Mountain. Lacking any distinguishing trait of refinement or culture, his composure suggested the possession of that necessary information which is the result of contact with the world and its inhabitants. He had that large air of ease and tranquillity which is born of association, and which represents one of the prime elements of the curious quality we call personal magnetism. He was ready-witted, and full of the spirit of adventure. He was the owner of the title to a land-lot somewhere in the neighborhood of Hog Mountain, and this land-lot was all that remained of an inheritance that had been swept away by the war. There was a tradition—perhaps only a rumor—among the Woodwards that the Hog Mountain land-lot covered a vein of gold, and to investigate this was a part of the young man's business in Gullettsville; entirely subordinate, however, to his desire to earn the salary attached to his position.

The presence of a stranger at the hospitable tavern of Squire Pleasants attracted the attention of the old and young men of leisure, and the most of them gathered upon the long, narrow piazza to discuss the matter. Uncle Jimmy Wright, the sage of the village, had inspected the name in the register and approved of it. He had heard of it before, and he proceeded to give a long and rambling account of whole generations of Woodwards. Jake Cohen, a peddler, who with marvelous tact had fitted himself to the conditions of life and society in the mountains, and who was supposed to have some sort of connection with the traffic in "blockade" whisky, gave some reminiscences of a family of Woodwards in Ohio. Tip Watson, who had a large local reputation for humor, gravely inquired of Squire Pleasants if the new-comer had left any message for him.

Doubtless the squire, or some one else, would have attempted a facetious reply to Mr. Watson; but just then a tall, gaunt, gray-haired, grizzly-bearded man stepped upon the piazza, and saluted the little gathering

with an awkward wave of the hand. The not unkindly expression of his face was curiously heightened (or deepened) by the alertness of his eyes, which had the quizzical restlessness we sometimes see in the eyes of birds or animals. It was Teague Poteet, and the greetings he received were of the most effusive character.

"Howdy, boys, howdy!" he said, in response to the chorus. "They haint airy one er you gents kin split up a twenty-dollar chunk er greenbacks, is they?"

Tip Watson made a pretense of falling in a chair and fainting, but he immediately recovered, and said in a sepulchral whisper:

"Ef you find anybody dead, an' they aint got no twenty-dollar bill on their person, don't come a-knockin' at my door. Lord!" he continued, "look at Cohen's upper lip a-trimblin'. He wants to take that bill out somewheres an' hang it on a clothes-line."

"Ow!" exclaimed Cohen, "yoost lizzen at date man! Date Teep Vatsen, he so foony as allt tem utter peoples put tergetter. Vait, Teague, vait! I chanche date pill right avay, terreckerly."

But Teague was absorbed in some information which Squire Pleasants was giving him.

"He don't favor the gang," the squire was saying, with emphasis, "an' I'll be boun' he aint much mixed up wi' 'em. He's another cut. Oh, they aint a-foolin' me this season of the year," he continued, as Teague Poteet shook his head doubtfully; "he aint mustered out'n my mind yit, not by a dad-blamed sight. I'm jest a-tellin' of you; he looks spry, an' he aint no sneak—I'll swar to that on the stan'."

"Well, I tell you, square," responded Teague, dryly, "I haint never seed people too purty to pester yuther folks; an' I reckon you aint nuther, is you?"

"No," said Squire Pleasants, his experience appealed to instead of his judgment; "no, I aint, that's a fact; but some folks youer bleege to take on trus'."

Further comment on the part of Poteet and the others was arrested by the appearance of Woodward, who came out of his room, walked rapidly down the narrow hallway, and out upon the piazza. He was bareheaded, his hands were full of papers, and he had the air of a man of business. The younger men who had gathered around Squire Pleasants and Teague Poteet fell back loungingly as Woodward came forward with just the faintest perplexed smile.

"Judge Pleasants," he said, "I'm terribly mixed up, and I'll have to ask you to unmix me."

The squire cleared his throat, adjusted his spectacles, and straightened himself in his chair. The title of Judge, and the easy air of deference with which it was bestowed, gave him an entirely new idea of his own importance. He frowned judicially as he laid his hand upon the papers.

"Well, sir," said he, "I'm gittin' ole, an' I reckon I aint much, nohow; I'm sorter like the gray colt that tried to climb in the shuck-pen—I'm weak, but willin'. Ef you'll jest whirl in an' make indication whar'in I can he'p, I'll do the best I kin."

"I've come up here to look after a lot of land," said Woodward. "It is described here as lot No. 18, 376th district, Georgia Militia, part of land lot No. 11, in Tugaloo, formerly Towaliga County. Here is a plat of Hog Mountain, but somehow I can't locate the lot."

The squire took the papers and began to examine them with painful particularity.

"That 'ar lot," said Teague Poteet, after awhile, "is the ole Mathis lot. The line runs right acrost my simblin' patch, an' backs up ag'in' my hoss-stable."

"Tooby shore—tooby shore!" exclaimed the squire. "Tut-tut! What am I doin'? My mind is drappin' loose like seed-ticks from a shumake bush. Tooby shore, it's the Mathis lot. Mr. Wooderd, Mr. Poteet—Mr. Poteet, Mr. Wooderd; lem me make you interduced, gents."

Mr. Woodward shook hands gracefully and cordially—Poteet awkwardly and a trifle suspiciously.

"It seems to me, Mr. Poteet," said Woodward, "that I have seen your name in the papers somewhere."

"Likely," replied Poteet; "they uv bin a mighty sight er printin' gwine on sence the war, so I've heern tell. Ef you'd a drapped in at Atlanty, you mought er seed my name mixt up in a warrant."

"How is that?" Woodward asked.

"Bekaze I bin a-bossin' my own affa'rs."

Poteet had straightened himself up, and he looked at Woodward with a steadiness which the other did not misunderstand. It was a look which said, "If you've got that warrant in your pocket, it wont be safe to pull it out in these diggin's."

Squire Pleasants recognized the challenge that made itself heard in Teague Poteet's voice.

"Yes, yes," he said, in a cheerful tone, "our folks is seen some mighty quare doin's sence the war; but times is a-gittin' a long ways better now."

"Better, hell!" exclaimed Sid Parmalee.

What he would have said further, no one can know, for the voluminous voice of Cohen broke in:

"Tlook ow-ut, t'ere, Sid! tlook ow-ut! t'at pad man kedge you!"

This remarkable admonition was received with a shout of laughter. Good humor was restored, and it was increased when Woodward, shortly afterward, drinking with the boys at Nix's saloon, called for three fingers of Mountain Dew, and washed it down with the statement that it tasted just as nice as liquor that had been stamped by the Government. In short, Woodward displayed such tact and entered with such heartiness into the spirit of the people around him that he disarmed the trained suspicions of a naturally suspicious community. Perhaps this statement should be qualified. Undoubtedly the marshal, could he have made a personal inspection of Woodward and his surroundings, would have praised his subordinate's tact. The truth is, while he had disarmed their suspicions, he had failed utterly to gain their confidence.

With a general as well as a particular interest in the direction of Hog Mountain, it was natural that Deputy Marshal Woodward should meet or overtake Miss Poteet as she rode back and forth between Gullettsville and the gray notch in the mountain known as Poteet's. It was natural, too, that he should take advantage of the social informalities of the section and make her acquaintance. It was an acquaintance in which Woodward and, presumably, the young lady herself, became very much interested; so that the spectacle of this attractive couple galloping along together over the red road that connected the valley with the mountain came to be a familiar one. And its effect upon those who paused to take note of it was not greatly different from the effect of such spectacles in other sections. Some looked wise and shook their heads sorrowfully; some smiled and looked kindly, and sent all manner of good wishes after the young people. But, whether they galloped down the mountain in the fresh hours of the morning, or rambled up its dark slope in the dusk of the evening, neither Woodward nor Sis Poteet gave a thought to the predictions of spite, or to the prophecies of friendliness.

The mountain girl was a surprise to Woodward. She had improved her few opportunities to the utmost. Such information as the Gullettsville Academy afforded she relished and absorbed, so that her education was thorough as far as it went. Neither her conversation nor her manners would have attracted special attention in a company of fairly bright young girls, but she formed a refreshing contrast to the social destitution of the mountain region.

Beyond this, her personality was certainly more attractive than that of most women, being based upon an independence which knew absolutely nothing of the thousand and one vexatious little aspirations that are essential to what is called social success. Unlike the typical American girl, whose sweetly severe portraits smile serenely at us from the canvas of contemporary fiction, Miss Poteet would have been far from equal to the task of meeting all the requirements of perfectly organized society; but she could scarcely have been placed in a position in which her natural brightness and vivacity would not have attracted attention.

At any rate, the indefinable charm of her presence, her piquancy, and her beauty was a perpetual challenge to the admiration of Deputy Marshal Woodward. It pursued him in his dreams and made him uncomfortable in his waking hours, so much so, indeed, that his duties as a revenue officer, perplexing at best, became a burden to him.

In point of fact, this lively young lady was the unforeseen quantity in the problem which Woodward had been employed to solve; and between his relations to the Government and his interest in Sis Poteet, he found himself involved in an awkward predicament. Perhaps the main features of this predicament, baldly presented, would have been more puzzling to the authorities at Washington than they were to Woodward; but it is fair to the young man to say that he did not mistake the fact that the Moonshiner had a daughter for an argument in favor of illicit distilling, albeit the temptation to do so gave him considerable anxiety.

In the midst of his perplexity, Deputy Marshal Woodward concluded that it would be better for the Government, and better for his own peace of mind, if he allowed Sis Poteet to ride home without an escort; and for several days he left her severely alone, while he attended to his duties, as became a young fellow of fair business habits.

But one afternoon, as he sat on the piazza of the hotel nursing his confusion and discontent, Sis Poteet rode by. It was a tantalizing vision, though a fleeting one. It seemed to be merely the flash of a red feather, the wave of a white hand, to which Woodward lifted his hat; but these were sufficient. The red feather nodded gayly to him, the white hand invited. His horse stood near, and in a few moments he was galloping toward the mountain with the Moonshiner's daughter.

When the night fell at Teague Poteet's on this particular evening, it found a fiddle going. The boys and girls of the mountain, to the number of a dozen or more, had gathered for a frolic—a frolic that shook the foundations

of Poteet's castle, and aroused echoes familiar enough to the good souls who are fond of the cotillion in its primitive shape. The old folks who had accompanied the youngsters sat in the kitchen with Teague and his wife, and here Woodward also sat, listening with interest to the gossip of what seemed to be a remote era—the war and the period preceding it.

The activity of Sis Poteet found ample scope, and, whether lingering for a moment at her father's side like a bird poised in flight, or moving lightly through the figures of the cotillion, she never appeared to better advantage.

Toward midnight, when the frolic was at its height, an unexpected visitor announced himself. It was Uncle Jake Norris, who lived on the far side of the mountain. The fiddler waved his bow at Uncle Jake, and the boys and girls cried "Howdy," as the visitor stood beaming and smiling in the door-way. To these demonstrations Uncle Jake, "a chunk of a white man with a whole heart," as he described himself, made cordial response, and passed on into the kitchen. The good humor of Mr. Norris was as prominent as his rotundity. When he was not laughing, he was ready to laugh. He seated himself, looked around at the company, and smiled.

"It's a long pull betwixt this an' Atlanty," he said after awhile; "it is that, certain an' shore, an' I haint smelt of the jug sense I lef' ther'. Pull 'er out, Teague—pull 'er out."

The jug was forthcoming.

"Now, then," continued Uncle Jake, removing the corn-cob stopper, "this looks like home, sweet home, ez I may say. It does, certain an' shore. None to jine me? Well, well! Times change an' change, but the jug is company for one. So be it. Ez St. Paul says, cleave nigh unto that which is good. I'm foreswore not to feel lonesome tell I go to the gallows. Friends! you uv got my good wishes, one an' all!"

"What's a gwine on?" asked Poteet.

"The same," responded Uncle Jake, after swallowing his dram. "Allers the same. Wickedness pervails well-nigh unto hit's own jestification. I uv seed sights! You all know the divers besettings wher'by Jackson Ricks wuz took off this season gone—murdered, I may say, in the teeth of the law an' good govunment. Sirs! I sot by an' seed his besetters go scotch-free."

"Ah!"

The exclamation came from Teague Poteet.

"Yes, sirs! yes, friends!" continued Uncle Jake, closing his eyes and tilting his chair back. "Even so. Nuther does I boast ez becometh the fibble-minded. They hurried an' skurried me forth an' hence, to mount upon the witness stan' an' relate the deed. No deniance did I make. Ez St. Paul says, sin, takin' occasion by the commandment, worked in me all manner of conspicuessence. I told 'em what these here eyes had seed.

"They errayed me before jedge an' jury," Uncle Jake went on, patting the jug affectionately, "an' I bowed my howdies. 'Gentermun friends,' s'I, 'foller me clos't, bekaze I'm a-givin' you but the truth, stupendous though it be. Ef you thes but name the word,' s'I, 'I'll take an' lay my han' upon the men that done this unrighteousness, for they stan' no furder than yon' piller,' s'I. 'Them men,' s'I, 'surroundered the house of Jackson Ricks, gentermun friends, he bein' a member of Friendship Church, an' called 'im forth wi' the ashoreance of Satan an' the intents of evil,' s'I; 'an' ole en decrippled ez he wuz, they shot 'im down—them men at yon' piller,' s'I, 'ere he could but raise his trimblin' han' in supplication; an' the boldest of 'em dast not to face me here an' say nay,' s'I."

"An' they uv cler'd the men what kilt pore Jackson Ricks!" said Teague, rubbing his grizzled chin.

"Ez clean an' ez cle'r ez the pa'm er my han'," replied Uncle Jake, with emphasis.

The fiddle in the next room screamed forth a jig, and the tireless feet of the dancers kept time, but there was profound silence among those in the kitchen. Uncle Jake took advantage of this pause to renew his acquaintance with the jug.

Deputy Marshal Woodward knew of the killing of Jackson Ricks; that is to say, he was familiar with the version of the affair which had been depended upon to relieve the revenue officers of the responsibility of downright murder; but he was convinced that the story told by Uncle Jake Norris was nearer the truth.

As the young man rode down the mountain, leaving the fiddle and the dancers to carry the frolic into the gray dawn, he pictured to himself the results of the raid that he would be expected to lead against Hog Mountain—the rush upon Poteet's, the shooting of the old Moonshiner, and the spectacle of the daughter wringing her hands and weeping wildly. He rode down the mountain, and, before the sun rose, he had written and mailed his resignation. In a private note to the marshal, inclosed with this document, he briefly but clearly set forth the fact that, while illicit distilling was as unlawful as ever, the man who loved a Moonshiner's daughter was not a proper instrument to aid in its suppression.

But his letter failed to have the effect he

desired, and in a few weeks he received a communication from Atlanta setting forth the fact that a raid had been determined upon.

Meantime, while events were developing, some of the old women of the Hog Mountain Range had begun to manifest a sort of motherly interest in the affairs of Woodward and Sis Poteet. These women, living miles apart on the mountain and its spurs, had a habit of "picking up their work" and spending the day with each other. Upon one occasion it chanced that Mrs. Sue Parmalee and Mrs. Puritha Hightower rode ten miles to visit Mrs. Puss Poteet.

"Don't lay the blame of it onter me, Puss," exclaimed Mrs. Hightower,—her shrill, thin voice in queer contrast with her fat and jovial appearance; "don't you lay the blame onter me. Dave, he's been a-complainin' bekaze they wa'n't no salsody in the house, an' I rid over to Sue's to borry some. Airter I got ther', Sue sez, se' she: 'Yess us pick up an' go an' light in on Puss,' se' she, 'an' fine out sump'n' nuther that's a-gwine on 'mongst folks,' se' she."

"Yes, lay it all onter me," said Mrs. Parmalee, looking over her spectacles at Mrs. Poteet; "I sez to Purithy, s' I, 'Purithy, yess go down an' see Puss,' s' I; 'maybe we'll git a glimpse er that air new chap with the slick ha'r. Sid'll be a-peggin' out airter awhile,' s' I, 'an' ef the new chap's ez purty ez I hear tell, maybe I'll set my cap fer 'im,' s' I."

At this fat Mrs. Puritha Hightower was compelled to lean on frail Mrs. Puss Poteet, so heartily did she laugh.

"I declar'," she exclaimed, "ef Sue haint a sight! I'm mighty nigh outdone. She's thes bin a-gwine on that a-way all the time, an' I bin that tickled tell a little more an' I'd a drapped on the groun'. How's all?"

"My goodness!" exclaimed Mrs. Poteet. "I hope you all know *me* too well to be a-stan'in' out there makin' excuse. Come right along in, an' take off your things, an' ketch your win'. Sis is home to-day."

"Well, I'm monstus glad," said Mrs. Highwater. "Sis useter think the world an' all er me when she was a slip of a gal, but I reckon she's took on town ways, haint she? Hit aint nothin' but natchul."

"Sis is proud enough for to hol' 'er head high," Mrs. Parmalee explained, "but she haint a bit stuck up."

"Well, I let you know," exclaimed Mrs. Hightower, untying her bonnet and taking off her shawl, "I let you know, here's what wouldn't be sot back by nothin' ef she had Sis's chances. In about the las' word pore maw spoke on 'er dying bed, she call me to 'er an' sez, se' she, 'Purithy Emma,' se' she, 'you hol' your head high; don't you bat you eyes to please none of 'em,' se' she."

"I reckon in reason I oughter be thankf that Sis aint no wuss," said Mrs. Poteet, walk ing around with aimless hospitality; "yit tha chile's temper is powerful tryin', an' Teagu ackshully an' candidly b'leeves she's mad out'n pyo' gol'.* I wish I may die ef he don't.

After a while Sis made her appearanc buoyant and blooming. Her eyes sparkle her cheeks glowed, and her smiles showe beautiful teeth—a most uncommon sight i the mountains, where the girls were in th habit of rubbing snuff or smoking. Th visitors greeted her with the effusive cor straint and awkwardness that made so larg a part of their lives, but after awhile, Mr Hightower laid her fat, motherly hand on th girl's shoulder, and looked kindly but keenl into her eyes.

"Ah, honey!" she said, "you haint sp'i yit, but you want made to fit thish here hill— *that* you wa'nt, *that* you wa'nt!"

Women are not hypocrites. Their littl thrills and nerve-convulsions are genuin while they last. Fortunately for the wome themselves, they do not last, but are suc ceeded by others of various moods, tense and genders. These nerve-convulsions are s genuine and so apt, that they are known a intuitions, and under this name they hav achieved importance. Mrs. Hightower, wit all her lack of experience, was capable o feeling that Sis Poteet needed the by-no means insubstantial encouragement that lie in one little note of sympathy, and she wa not at all astonished when Sis responded t her intention by giving her a smart little hug

Presently Mrs. Parmalee, who had stationed herself near the door, lifted her thin righ arm and let it fall upon her lap.

"Well, sir!" she exclaimed, "ef yande aint Sis's bo!"

Sis ran to the door, saw Woodward comin up the road, and blushed furiously—a fea which Mrs. Hightower and Mrs. Parmalee with all their experience, had rarely seen per formed in that region.

Woodward greeted Mrs. Poteet's visitor with a gentle deference and an easy courtesy that attracted their favor in spite of themselves Classing him with the "Restercrats," these women took keen and suspicious note of every word he uttered, and every movemen he made, holding themselves in readiness to become mortally offended at a curl of the lip or the lifting of an eyebrow; but he was equal to the occasion. He humored thei whims and eccentricities to the utmost, and

* Pure gold.

he was so thoroughly sympathetic, so genial, so sunny, and so handsome withal, that he stirred most powerfully the maternal instincts of those weather-beaten bosoms and made them his friends and defenders. He told them wonderful stories of life in the great world that lay far beyond Hog Mountain, its spurs and its foot-hills. He lighted their pipes, and even filled them out of his own tobacco-pouch, a proceeding which caused Mrs. Parmalee to remark that she "would like manny-fac'* mighty well ef 'twer'n't so powerful weak."

Mrs. Hightower found early opportunity to deliver her verdict in Sis's ear, whereupon the latter gave her a little hug, and whispered: "Oh, I just think he's adorable!" It was very queer, however, that as soon as Sis was left to entertain Mr. Woodward (the women making an excuse of helping Puss about dinner), she lost her blushing enthusiasm and became quite cold and reserved. The truth is, Sis had convinced herself some days before that she had the right to be very angry with this young man, and she began her quarrel, as lovely woman generally does, by assuming an air of tremendous unconcern. Her disinterestedness was really provoking.

"How did you like Sue Fraley's new bonnet last Sunday?" she asked, with an innocent smile.

"Sue Fraley's new bonnet!" exclaimed Woodward, surprised in the midst of some serious reflections; "why, I didn't know she had a new bonnet."

"Oh! you *didn't?* You were right *opposite.* I should think *anybody* could see she had a new bonnet by the way she tossed her head."

"Well, I didn't notice it, for one. Was it one of these sky-scrapers? I was looking at something else."

"*Oh!*"

Woodward had intended to convey a very delicately veiled compliment, but this young woman's tone rather embarrassed him. He saw in a moment that she was beyond the reach of the playful and ingenious banter which he had contrived to make the basis of their relations.

"Yes," he said, "I was looking at something else. I had other things to think about."

"Well, she *did* have a new bonnet, with yellow ribbons. She looked handsome. I hear she's going to get married soon."

"I'm glad to hear it. She's none too young," said Woodward.

At another time, Sis would have laughed at the suggestion implied in this remark, but now she only tapped the floor gently with her foot, and looked serious.

"I hope you answered her note," she said presently.

"What note?" he asked, with some astonishment.

Sis was the picture of innocence.

"Oh, I didn't think!" she exclaimed. "I reckon it's a great *secret.* I mean the note she handed you when she came out of church. It's none of *my* business."

"Nor of mine, either," said Woodward, with a relieved air. "The note was for Tip Watson."

This statement, which was not only plausible but true, gave a new direction to Sis's anger.

"Well, I don't see how anybody that thinks anything of himself could be a mail-carrier for *Sue Fraley,*" she exclaimed, scornfully; whereupon she flounced out, leaving Woodward in a state of bewilderment.

He had not made love to the girl, principally because her moods were elusive and her methods unique. She was dangerously like other women of his acquaintance, and dangerously unlike them. The principal of the academy in Gullettsville — a scholarly old gentleman from Middle Georgia, who had been driven to teaching by dire necessity — had once loftily informed Woodward that Miss Poteet was superior to her books, and the young man had verified the statement to his own discomfiture. She possessed that feminine gift which is of more importance to a woman in this world than scholarly acquirements — aptitude. Even her frankness — perfectly discreet — charmed and puzzled Woodward; but the most attractive of her traits were such as mark the difference between the bird that sings in the tree, and the bird that sings in the cage — delightful but indescribable.

When Sis Poteet began to question him about Sue Fraley, the thought that she was moved by jealousy gave him a thrill that was new to his experience; but when she flounced angrily out of the room because he had confessed to carrying a note from Miss Fraley to Tip Watson, it occurred to him that he might be mistaken. Indeed, so cunning does masculine stupidity become when it is played upon by a woman that he frightened himself with the suggestion that perhaps, after all, this perfectly original young lady was in love with Tip Watson.

During the rest of the day Woodward had ample time to nurse and develop his new theory, and the more he thought it over, the more plausible it seemed to be. It was a great blow to his vanity; but the more uncomfortable it made him, the more earnestly he clung to it.

* "Manufactured" tobacco, in contradistinction to the natural leaf.

Without appearing to avoid him, Sis managed to make the presence of Mrs. Parmalee and Mrs. Hightower an excuse for neglecting him. She entertained these worthy ladies with such eager hospitality that when they aroused themselves to the necessity of going home, they found, to their dismay, that it would be impossible, in the language of Mrs. Poteet, to "git half-way acrost Pullium's Summit 'fore night 'ud ketch 'em." Sis was so delighted, apparently, that she became almost hilarious; and her gayety affected all around her except Woodward, who barely managed to conceal his disgust.

After supper, however, Mrs. Poteet and her two guests betook themselves to the kitchen, where they rubbed snuff and smoked their pipes, and gossiped, and related reminiscences of that good time which, with old people, is always in the past. Thus Woodward had ample opportunity to talk with Sis. He endeavored, by the exercise of every art of conversation and manner of which he was master, to place their relations upon the old familiar footing, but he failed most signally. He found it impossible to fathom the gentle dignity with which he was constantly repulsed. In the midst of his perplexity, which would have been either pathetic or ridiculous if it had not been so artfully concealed, he managed for the first time to measure the depth of his love for this exasperating but charming creature whom he had been patronizing. She was no longer amusing; and Woodward, with the savage inconsistency of a man moved by a genuine passion, felt a tragic desire to humble himself before her.

"I'm going home to-morrow, Miss Sis," he said, finally, in sheer desperation.

"Well, you've had a heap of fun—I mean," she added, "that you have had a nice time."

"I have been a fool!" he exclaimed, bitterly. Seeing that she made no response, he continued: "I've been a terrible fool all through. I came here to hunt up blockade whisky——"

"*What!*"

Sis's voice was sharp and eager, full of doubt, surprise, and consternation.

"I came to Gullettsville," he went on, "to hunt up blockade whisky and failed, and three weeks ago I sent in my resignation. I thought I might find a gold mine on my land-lot, but I have failed; and now I am going to sell it. I have failed in everything."

Gloating over his alleged misfortunes, Woodward, without looking at Sis Poteet, drew from his pocket a formidable-looking envelope, unfolded its contents leisurely, and continued:

"Even my resignation was a failure. Hog Mountain will be raided to-morrow or next day."

Sis rose from her chair, pale and furious, and advanced toward him as if to annihilate him with her blazing eyes. Such rage, such contempt, he had never before beheld in a woman's face. He sat transfixed. With a gesture almost tragic in its vehemence, the girl struck the papers from his hands.

"Oh, you mean, sneaking wretch! You ——"

And then, as if realizing the weakness of mere words, she turned and passed swiftly from the room. Woodward was thoroughly aroused. He was not used to the spectacle of a woman controlled by violent emotions, and he recognized, with a mixture of surprise and alarm, the great gulf that lay between the rage of Sis Poteet and the little platitudes and pretenses of anger which he had seen the other women of his acquaintance manage with such pretty daintiness.

As the girl passed through the kitchen, she seized a horn that hung upon the wall and went out into the darkness. The old women continued their smoking, their snuff-rubbing, and their gossiping. Mrs. Hightower was giving the details of a local legend showing how and why Edny Favers had "conjured" Tabithy Cozby, when suddenly Mrs. Poteet raised her hands:

"*Sh-h-h!*"

The notes of a horn—short, sharp, and strenuous—broke in upon the stillness of the night. Once, twice, thrice! once, twice, thrice! once, twice, thrice! It was an alarm that did not need to be interpreted to the sensitive ear of Hog Mountain. The faces of the old women became curiously impassive. The firelight carried their shadows from the floor to the rafters, where they seemed to engage in a wild dance,—whirling, bowing, jumping, quivering; but the women themselves sat as still as statues. They were evidently waiting for something. They did not wait long. In a little while the sharp notes of the horn made themselves heard again—once, twice, thrice! once, twice, thrice! once, twice, thrice!

Then the old women arose from their low chairs, shook out their frocks, and filed into the room where Mr. Philip Woodward, late of the revenue service, was sitting. There would have been a good deal of constraint on both sides, but before there could be any manifestation of this sort, Sis came in. She seemed to be crushed and helpless, nay, even humiliated.

"Why, my goodness, Sis!" exclaimed Mrs. Hightower, "you look natchully fagged out. A body 'ud think you'd bin an' taken a run

up the mountain. We all 'lowed you wuz in here lookin' airter your comp'ny. Wher'd you git the news?"

"From this gentleman here," Sis replied, indicating Woodward without looking at him. She was pale as death, and her voice was low and gentle.

Woodward would have explained, but the apparent unconcern of the women gave him no opportunity.

"I declare, Sis," exclaimed her mother, with a fond, apologetic little laugh; "ef you haint a plum sight, I haint never seed none."

"She's thes es much like her Gran'pap Poteet," said Mrs. Hightower, "ez ef he'd 'a' spit 'er right out'n his mouth—that she is."

This led to a series of reminiscences more or less entertaining, until after awhile, Sis, who had been growing more and more restless, rose and said:

"Good-night, folks; I'm tired and sleepy. The clock has struck eleven."

"Yes," said Mrs. Poteet, "an' the clock's too fast, bekaze it haint skacely bin more'n a minnit sence the chickens crowed for ten."

This remark contained the essence of hospitality, for it was intended to convey to Mrs. Poteet's guests the information that if they were not ready to retire, she was prepared to discredit her clock in their interests. But there was not much delay on the part of the guests. The women were dying to question Sis, and Woodward was anxious to be alone; and so they said "Good-night," the earnestness and quaint simplicity of the old women carrying Woodward back to the days of his childhood, when his grandmother leaned tenderly over his little bed and whispered: "Good-night, dear heart, and pleasant dreams."

Shortly afterward the lights were put out, and, presumably, those under Teague Poteet's roof addressed themselves to slumber. But what of the news that Sis had given to the winds? There was no slumber for it until it had fulfilled its mission. Where did it go, and what was its burden? Three sharp blasts upon a horn, thrice repeated; then an interval; then three more thrice repeated. Up, up the mountain the signal climbed; now faltering, now falling, but always climbing; sending echoes before it, and leaving echoes behind it, but climbing, climbing; now fainting and dying away, but climbing, climbing, until it reached Pullium's Summit, the smallest thread of sound. Two men were sitting talking in front of a cabin. The eldest placed one hand upon the shoulder of his companion, and flung the other to his ear. Faint and far, but clear and strenuous, came the signal. The men listened even after it had died away. The leaves of the tall chestnuts whipped each other gently, and the breeze that had borne the signal seemed to stay in the tops of the mountain pines as if awaiting further orders; and it had not long to wait.

The man who had held his hand to his ear slapped his companion on the back and cried, "Poteet's!" and that was news enough for the other, who rose, stretched himself lazily, and passed into the cabin. He came out with a horn—an exaggerated trumpet made of tin—and with this to his lips he repeated to the waiting breeze, and to the echoes that were glad to be aroused, the news that had come from Poteet's. Across the broad plateau of Pullium's Summit the wild tidings flew until, reaching the western verge of the mountain, they dived down into Prather's Mill Road—a vast gorge which takes its name from the freak of a drunken mountaineer, who declared he would follow the stream that rushed through it until he found a mill, and was never heard of again.

The news from Poteet's was not so easily lost. It dropped over the sheer walls of the chasm, three hundred feet down, and refused to be drowned out by the rush and roar of the waters, as they leaped over the bowlders, until it had accomplished its mission. For here in Prather's Mill Road burned the slow fires that kept the Government officials in Atlanta at a white heat. They were burning now. If one of the officials could have crawled to the edge of the gorge, where everything seemed dwarfed by the towering walls of rock and the black abyss from which they sprang, he would have seen small fitful sparks of flame glowing at intervals upon the bosom of the deeper and blacker night below. These were the fires that all the power and ingenuity of the Government failed to smother, but they were now blown out one after another by the blasts from Sis Poteet's horn.

The news that was wafted down into the depths of Prather's Mill Road upon the wings of the wind was not at all alarming. On the contrary, it was received by the grimy watchers at the stills with considerable hilarity. To the most of them it merely furnished an excuse for a week's holiday, including trips to both Gullettsville and Villa Ray. Freely interpreted, it ran thus: "Friends and fellow-citizens: this is to inform you that Hog Mountain is to be raided by the revenue men by way of Teague Poteet's. Let us hear from you at once." There was neither alarm nor hurry, but the fires were put out quickly because that was the first thing to be done.

Teague Poteet owned and managed two stills. He was looking after some "doublings" when the notes of the horn dropped down into the gorge. He paused, and listened,

and smiled. Uncle Jake Norris, who had come to have his jug filled, was in the act of taking a dram, but he waited, balancing the tin cup in the palm of his hand. Tip Watson was telling one of his stories to the two little boys who accompanied Uncle Jake, but he never ended it.

"Sis talks right out in meetin'," said Teague, after waiting to be sure there was no postscript to the message.

"What's the row, Teague?" asked Uncle Jake, swallowing his dram.

"'Nother raid comin' right in front er my door," Teague explained, "an' I reckon in reason I oughter be home when they go past. They useter be a kinder coolness betweenst me an' them revenue fellers, but we went to work an' patched it up."

Tip Watson appeared to be so overjoyed that he went through all the forms of a cotillion dance, imitating a fiddle, calling the figures, and giving his hand to imaginary partners. The boys fairly screamed with laughter at this exhibition, and Uncle Jake was so overcome that he felt called upon to take another dram — a contingency that was renewed when Tip swung from the measure of a cotillion to that of a breakdown, singing:

"I haint bin a-wantin' no mo' wines — mo' wines —
Sence daddy got drunk on low wines — low wines."

"Come, Tip," said Teague, "yess shet up shop. Ef Sis aint a caution," he said, after awhile, as he moved around putting things to rights. "Ef Sis aint a caution, you kin shoot me. They haint no mo' tellin' wher Sis picked up 'bout thish'ere raid than nothin' in the worl'. Dang me ef I don't b'lieve the gal's glad when a raid's a-comin'. Wi' Sis, hit's move*ment*, move*ment*, day in an' day out. They haint nobody knows that gal less'n it's me. She knows how to keep things a-gwine. Sometimes she runs an' meets me, an' says se'she: 'Pap, mammy's in the dumps; yess you an' me make out we er quollin'. Hit'll sorter stir 'er up'; an' then Sis, she'll light in an' by the time we git in the house, she's a-scoldin' an' a-sassin' an' I'm a-cussin, an airter awhile hit gits so hot an' natchul-like that I thes has ter drag Sis out behin' the chimbly and buss 'er to make certain an shore that she aint accidentually flew off the han'le. Bliss your soul an' body! she's a caution!"

"An' what's 'er maw a-doin' all that time?" inquired Uncle Jake, as he took another dram with an indifferent air.

Teague laughed aloud as he packed the fresh earth over his fire.

"Oh, Puss! Puss, she thes sets thar a-chawin' away at 'er snuff, an' a-knittin' away at 'er socks tell she thinks I'm a-pushin' Sis too clost, an' then she blazes out an' blows me up. Airter that," Teague continued, "things gits more homelike. Ef twan't fer me an' Sis, I reckon Puss 'ud totally fret 'erself away."

"St. Paul," said Uncle Jake, looking confidentially at another dram which he had poured into the tin cup,—"St. Paul says ther' er divers an' many wimmin, an' I reckon he know'd. Ther' er some you kin fret an' some you can't. Ther's my ole 'oman: the livin' human bein' that stirs *her* up'll have ter frail 'er out, er she'll frail *him*."

"Well," said Teague, by way of condolence, "the man what's stabbed by a pitchfork haint much better off 'n the man that walks bar'footed in a treadsaft patch."

The suggestion in regard to Mistress Norris seemed to remind Uncle Jake of something important. He called to his boys, took another modest dram, and disappeared in the undergrowth. Teague Poteet and his friends were soon ready to follow this worthy example, so that in another hour Prather's Mill Road was a very dull and uninteresting place from a revenue point of view.

THIS LILY.

If summer unto summer uttereth speech,
As wise ones say,
This tender lily, here in my rude reach,
Hath lived for aye.

Through all the fair, far, unremembered seasons
Its sweets have thrilled;
Who ponders here a little while, and reasons,
His fears are stilled.

'Tis death and darkness that have been your making,
O lily white!
'Tis *here* you meet with blight, and loss, and breaking,—
Here in the light.

E. M. Booth.

TOPICS OF THE TIME.

A New Departure.

WITH the beginning of the present series of this periodical under the name of THE CENTURY (November, 1881), a new enlargement of the contents of the magazine took place, amounting to about fourteen pages in each number. This enlargement was effected by the omission of ruled lines and the extension of the printed page. The pressure of original matter on our columns has since then so greatly increased, that it seems necessary to make still more room for the work of both our old and new contributors. There are several causes which tend to create the pressure of which we speak. Our readers are aware of the fact that most of the American authors whose names were conspicuous in the early volumes of the magazine are still living, and many of them are still writing for THE CENTURY. In addition to these, several well known American and foreign writers have since been added to our list of contributors; and, in the meantime, the magazine has drawn around it a brilliant company of young writers who must be provided with an outlet for their teeming stories, essays, and poems. Moreover, it would seem that during the thirteen years since we began the preparation of the magazine's first issue, the average of literary ability throughout the community has risen in quality,—at any rate, we know that we find ourselves constantly compelled to decline contributions well worthy of acceptance, for the sole reason that we have no room for them.

Under these circumstances, and in order to make room for a larger amount of original work,—for matter of greater pith and moment,—we purpose to omit the three departments of "Literature," "Home and Society," and the "World's Work," and in place of them to establish a new department (not necessarily regular in its appearance) entitled "Open Letters." This new department will be the place for brief and pithy signed essays on all subjects; and in this department, and elsewhere in the magazine and in the remaining regular departments, we shall continue to treat—we trust not less well than heretofore, though not so constantly—of the most important points in current literature and current invention. It seems to us to be the province of a magazine like THE CENTURY to make room for original and creative writing, for the work of the imagination, for novels, short stories; for criticism of the highest order on literature, art, politics, and morals; for fresh and authoritative reports from the world of science (science in its broadest sense); original accounts of travel in new lands and old; and original historical and biographical writing,—it seems to us, we say, the province of this magazine to make room for contributions like these, rather than to encumber its pages with departmental records, such as may be elsewhere and earlier obtained, namely in our weekly and daily periodicals.

This further virtual enlargement of the magazine will give opportunity for still greater variety of theme and thoroughness of treatment in the contents of each number of THE CENTURY.

The Effects of Civil Service Reform upon Parties.

THE probable effects of Civil Service Reform upon our national parties is an interesting subject of speculation. Hitherto it cannot be said that either party, as such, has done anything to promote the reform, though neither has offered any but a passive opposition to it. The majority of the leaders on both sides in the Houses of Congress cast their votes for the measure; but it was evident that most of them did so because they had become convinced that the people demanded reform, and not because they cared for it themselves. As for the mass of voters, there can be no doubt that the great majority in both parties are heartily in favor of reform, although its leading advocates have been, for the most part, adherents of the Republican organization. Thus far, then, neither party has gained any particular credit by its conduct toward civil service reform, while at the same time neither can be set down as its avowed opponent.

But now that the reform has been begun, it remains to be seen what attitude the two parties will assume toward it, and what effects it will have upon them. In the first place, then, it is not likely that either party will actively oppose the reform; for if party lines were drawn on this issue, the defeat of the opposition party would be certain and complete. The people are so well informed on the subject and so determined on reform, that no party could now take its stand on the old doctrine of spoils with the least chance of success. There are indications, indeed, that some of the Democrats, believing that their party will win the Presidential election in 1884, are inclined to retain the old system, so far as possible, that they may reap a rich harvest of offices on their accession to power; but, in view of the strong and ever increasing sentiment in favor of reform, these bad counsels are not likely to prevail with the masses of the party.

Meanwhile, the Republicans, owing to their control of national administration, will necessarily have the largest share in carrying out the reform, and they have it in their power, by administering the new law with fidelity and zeal, not only to make the reform a complete success, but to win back for themselves some of the popularity which they have lost. But the conduct of the Republican managers in the past does not promise on their part any special devotion to reform methods in the future; and therefore, if parties remain in their present form, their attitude toward civil service reform will probably be neither one of open hostility nor of active support, but of reluctant acquiescence.

But there is another aspect of the case which is deserving of consideration. If the civil service is reformed, and the offices are thus removed from partisan control, will not the change have the effect of loosening the bonds of party, and thereby help to break up the existing organizations preparatory to the formation of new ones? Under a normal condition of affairs such a result would be impossible; for political parties, as a rule, have some higher object than the mere dis-

tribution of spoils. A party is supposed to be based upon some principle or some system of policy, which its members believe in and which their organization is designed to carry into effect; and so long as the party is working for the success of its principles, no question of spoils can dissolve or divide it. But our national parties at the present time are not based upon principle, nor is there a single measure of living interest to the people, on which the members of either party are agreed. Under such circumstances, it would seem natural and eminently desirable that the old parties should be dissolved, or else re-organized on a new basis so as to represent some positive principles, and there is already in the country a strong sentiment in favor of such a change. But hitherto the traditions of the past, the power of organization, and the desire for the spoils of office have held the old parties firmly together and effectually prevented the re-arrangement which so many desire.

But the force of tradition is now virtually spent, as last autumn's elections abundantly prove, and hence the existing parties have no motive to action except the desire for office, and no bond of union except the power of organization, which is wielded by the office-holders and office-seekers themselves. If, then, the offices are removed from partisan control, this last remaining bond will be snapped asunder; and it is hard to see how, in that case, the existing organizations can be longer maintained.

We look, therefore, for a re-arrangement of parties before many years, as a consequence of reforming the civil service; and if this should happen, it will not be the least of the benefits which the reform will bring us, for a more unsatisfactory division of parties than that now existing it would be hard to conceive, and almost any change would be an improvement. For some years past the case has been that a man, in casting a vote, had not the least idea what principles or what policy his vote would promote,—whether one that he approved or one that he disapproved; and so long as this state of affairs continues, it is impossible for any man of convictions to attach himself cordially to either party. A man of principle can only belong to a party of principle; and as existing parties have no principles at all, such men have nowhere to go to. Young men in particular, and educated young men most of all, find nothing in the old parties to attract or rouse enthusiasm, and they will welcome civil service reform with additional pleasure if it shall have the effect of dissolving these bodies and thereby preparing the way for new parties based upon principles and animated by ideas.

The Appointment of Postmasters.

THE new measure of civil service reform seems to be all that is needed for the offices to which it relates, and, if properly executed, it will effectually remove the clerkships and many other minor offices from partisan control, besides improving the quality and self-respect of the officers themselves. At first, indeed, the operation of the law is restricted to the larger offices having fifty or more persons employed; but provision is made for extending the system to the smaller offices also, after it has been established and tested in the larger ones. In this way the appointment of all the minor officers will be provided for, with the exception of the postmasters; but for these no provision has yet been made. It is obvious, however, that the reform will not be complete until some method is adopted for appointing these officers which will remove them also from partisan control and make them the servants of the people and not the servants of a party.

At the present time all postmasters whose yearly salary is less than one thousand dollars—and there are more than forty-four thousand of them—are appointed by the Postmaster-General; and according to the pernicious custom now in vogue, he is expected to make both appointments and removals at the instigation of members of Congress. The postmasters thus appointed are commissioned for an indefinite period, and, if the service were conducted on business principles, would hold their offices as long as they filled them well. But, under the present system, they are liable to removal at any time when the member of Congress from their district so demands; while, on the advent of the opposite party to power, there may be a wholesale removal of all the postmasters in the country. The effect of this partisan management is to make the postmasters the agents of the party that controls the administration; and so long as this system is retained in the post-offices, the reform of the civil service will be but half accomplished.

It seems clear, however, that in the case of postmasters the method of selection by competitive examination will not serve, for no such examination can test those qualities which in a postmaster are most imperatively required. The clerical duties in the smaller post-offices are of trifling amount and fully within the competence of any person who can transact business of a simple kind; but certain moral and other qualities are required in a postmaster, which no examination can reveal, and which can only be ascertained by personal acquaintance. Both the Government and the people have to trust the postmaster, the one with its money, the other with its letters; and he to whom such matters are confided ought, above all things, to be a man of known integrity and responsibility and of good business habits, and it is obvious that such qualities as these cannot be determined by competitive examination.

Moreover, the public convenience must be consulted; and hence in a thinly settled district it is often necessary to appoint the most available man, whether he is ideally fitted for the place or not. In many post-offices the salary is not sufficient for a man to live on, and they must therefore be held by persons engaged in other business; and in such cases it may be necessary to appoint a man whose place of business is so situated as to accommodate the people, though his scholarship may be slight and his other qualifications not all that could be desired.

These considerations, we say, show that the system of competitive examination cannot be applied in the case of postmasters, but that their fitness must be ascertained by other means and, in particular, by the testimony of those who are personally acquainted with them. It is obvious, however, that the Postmaster-General cannot himself make the investigation necessary to determine the fitness of candidates for such a mass of offices, scattered as they are over three million square

miles of territory, and he must, therefore, depend in each case on the advice of persons living in the neighborhood in which the officer is to serve. Hence the custom has arisen of taking the advice of Congressmen, the effect of which is, as above remarked, to make the postal service an agency of the party in power; and what we want is some method of appointment that will free the service from this partisan influence.

Some have suggested that the choice of postmasters should be given to the people; but this cannot be done without a change in the constitution, and besides, there is nothing in such a method of selection to recommend it to the friends of reform. We have too many elective offices now,—so many that it is impossible for the people to ascertain the qualifications of all the candidates,—and it is very undesirable to increase the number. Nor is it by any means certain that choice by the people would always put the fittest man into a purely business position like a post-office, while it would not improbably perpetuate the partisan character of the service, which it is the special object of civil service reform to abolish. It seems far better to retain the method of appointment by the Postmaster-General, only adopting some means for determining the fitness of candidates without resorting to the advice of members of Congress.

Now, it would seem that persons already employed in the postal service and living in the vicinity of the office to be filled would be the best judges of the qualifications of the candidates, and it would seem to be easy to make the services of such persons available for this purpose. Suppose that there be appointed in each State one or more boards of examiners, composed of persons employed in the postal service, and charged with the duty of examining all applicants for post-offices and ascertaining their qualifications. In the performance of this duty they should not be restricted to the methods employed in the case of clerks, but should use whatever means should be necessary to determine the character and business capacity of the applicants. The natural place for such a board to meet would be at one of the large distributing offices, where they would have ready means of communication with the neighboring towns, and where information about the candidates could be readily obtained. Each board would have a definite territory assigned to it, and its members should be so selected that they could easily assemble for the performance of their duties. Then, when a post-office was to be filled, the board of examiners within whose district it was situated would inquire into the fitness of the applicants and report to the Postmaster-General the names of those best qualified, with the comparative merits of each, and he would appoint the officer from among this number.

Such a method of selection could be easily established, as the appointment of the examining boards and the general supervision of the system would be intrusted to the Civil Service Commission; and the work of examination and inquiry could be easily performed. No objection can be made to the plan on constitutional grounds; for the Postmaster-General owes his power of appointment to an act of Congress, and Congress, in conferring the power, may undoubtedly impose rules and regulations for its exercise.

That some such method of appointment, if successfully put into practice, would result in the improvement of the postal service, seems hardly doubtful; for it would free it from the dictation of members of Congress and divest it entirely of its partisan character.

OPEN LETTERS.

On the Late Dr. Leonard Bacon and the Abolitionists.

It is to be regretted that Dr. Leonard Woolsey Bacon, in paying a tribute to the character and memory of his eminent father, in The Century for March, did not confine himself to themes which he is qualified, by adequate information and a judicial temper, to discuss, instead of reviving and seeking to justify his father's old controversy with the abolitionists and setting up in his behalf the preposterous claim that his name is above every name on the roll of anti-slavery worthies.

This claim, as "a matter of interest to public morals," I am constrained to challenge, and if in doing so I speak of matters concerning which, in charity to the dead, I would gladly be silent, the responsibility must rest upon him who has forced upon me the unwelcome discussion.

That Dr. Bacon, senior, opposed the abolitionists with might and main his filial eulogist frankly admits; but he insists that this opposition originated in a discriminating estimate of the character and surroundings of slavery and of the duties of slave-masters, and in repugnance to the "false positions, bad logic, and in some cases malignant passions" of Mr. Garrison and "the little ring of his personal adherents," whose great fault, it seems, was that they did not, like Dr. Bacon, confine their denunciations of slavery to the "system," and fill their mouths at the same time with excuses for the poor unfortunate slave-holders,—who were assumed to be in an agony of desire to rid themselves of slavery, while unable to do so, being in the condition of the boy who locked himself into a closet with the key in his own pocket, and so was unable to get out when his father called him to turn the grindstone.

The vocabulary of the abolitionists, too, it appears, was very objectionable, including, as it did, such words as "man-stealer" and "pirate," which they applied, Dr. Bacon says, to "the legal guardian of a decrepit negro," or to "one holding a family of slaves in transit for a free State with intent to emancipate them." Dr. Bacon, no doubt, believes this to be true; but he is mistaken—it is only caricature. The abolitionists neither uttered any such nonsense, nor made any such application of their principles. Their definition of slavery was elastic enough to cover every genuine case of conscience. They always sympathized

with any slave-holder who, convinced of the wrongfulness of slavery, desired in good faith to find a way of escape from the grip of cruel laws. They had in their ranks not a few men of this class, who had thus escaped from the "system." The names of Nelson, Birney, Brisbane, and half a score of others, will readily occur to those acquainted with the reform. We always lent a helping hand to such men, never breaking the bruised reed nor quenching the smoking flax. The criticisms of the late Dr. Bacon and others upon the doctrine of the sinfulness of slave-holding were exactly upon a level with those of a certain class of Gradgrind philosophers upon the Beatitudes and the Golden Rule. The late Joseph Barker, it will be remembered, could demonstrate the absurdity of these in five minutes at any time. It was only necessary to quibble over the words with an astute pettifogger's ingenuity. The abolitionists were practical men; they said bluntly, "Slavery is a sin," and meant it; they accepted the definition of slavery written for them in the statutes of the South, dealing with slave-holding in a common-sense way as a sin to be repented of and forsaken, and refusing to be turned aside by apologetic casuistry, from whatever source it might come.

The abolitionists learned their vocabulary from authorities older than the late Dr. Bacon. They remembered that it was John Wesley who said, "Slavery is the sum of all villainies"—"men-buyers are exactly on a level with men-stealers." They remembered also the words of Jonathan Edwards: "To hold a man in a state of slavery is to be every day guilty of robbing him of his liberty or of man-stealing." They called to mind, moreover, the words of the Presbyterian Church, which, according to Dr. Bacon, "represented the thought, culture, and conscience of the South," and which, in 1794, in a note on the eighth commandment, said: "The law was made for man-stealers. * * * Stealers of men are all those who bring off slaves or freemen, and keep, sell, or buy them." The height and depth and length and breadth of their fanaticism may thus be measured. They followed the light of these great examples, from which the ministry and churches—led by Bacon, Stuart, and Hodge—revolted and turned away. When the abolitionists struck at slavery, these men started up with their casuistry and their metaphysics to break the force of their appeals, seeking to "pinch them between the jaws of a definition," as if the letter had been devised to entrap and stifle the spirit! The whole purpose and effect of their ingenuity was to shield from censure the religious slave-holders, whose example was more powerful than that of any other class in sustaining slavery. Whenever a slave-holding clergyman or pious layman was arraigned, these men always set up the cry of persecution in his behalf, and thousands of people were led to think that slave-holding, if only well mixed with prayers, hymns, and hallelujahs, and flavored by a flaming zeal for revivals, missions, etc., was really quite a scriptural and commendable practice. Notwithstanding this class of slave-holders had taken part in enacting the laws forbidding emancipation, and never so much as sought their repeal, those laws were held to be their sufficient excuse for continuing to hold slaves. Just here was the practical issue between the abolitionists and their religious opponents. It was this attitude of the Northern churches and clergy that encouraged the South to resist the antislavery movement, to deny the right of discussion, and finally to organize the rebellion.

There was a time when Dr. Bacon's opposition to slavery or, rather, to slavery extension, was earnest and effective, and, remembering this, we should not be unwilling to let the blots upon his earlier record pass unnoticed, if his champions did not compel us, "as a matter of interest to public morals," to set them in the light. The simple truth is that Dr. Bacon was one of the blind leaders of the blind multitude who, fifty years ago, "did not see how slavery was to be got rid of," and who were forever wandering about in a metaphysical cloud, throwing obstructions in the way of those whose vision was clear. Against the "system" of slavery as "thoroughly bad and wrong," he could inveigh most eloquently; but of what avail was that so long as he excused slave-holding? His followers were forever saying, "We are abolitionists as much as anybody, BUT"; and the "but" was the only emphatic word, the rest being mere wind. Dr. Bacon's opinion, in 1830, was that the slave-holders then upon the stage were guiltless in upholding the system; for he said, in so many words: "For the existence of slavery in the United States those, and those only, are accountable who bore a part in originating such a constitution of society." The guilty, in other words, were dead, the living were innocent! Here is the explanation of his opposition to Garrison, who held, on the contrary, that the slave-holders were wrong-doers, and summoned them to undo the heavy burdens and let the oppressed go free. Dr. Bacon, instead of fighting slavery, fought the abolitionists, as the bull fought the locomotive, and with a similar result. He and Joseph Tracy invented a society by which they hoped to divert popular support from the antislavery associations; but it fell still-born, because it aimed at point-no-point, and was like "a cake unturned"—cinders on one side, dough on the other.

Dr. Bacon early in life fell into the toils of the Colonization Society—a circumstance which his son carefully avoids mentioning. He supported it with his voice and pen for more than twenty years, and never, so far as I know, publicly renounced it. That society, as may be seen by its official documents, commended itself to the South as calculated to "contribute effectually to the continuance and strength of slavery," and to "augment instead of diminishing the value of slave property." It opposed emancipation, except upon "the condition that the emancipated shall leave the country." It held it to be "an ordination of Providence, no more to be changed than the laws of nature," that the improvement and elevation of the negroes in this country was impossible. Dr. Bacon himself wrote: "Here a slave cannot really be emancipated. You cannot raise him from the abyss of his degradation. You may call him free, you may enact a statute-book of laws to make him free, but you cannot bleach him into the enjoyment of freedom." Was this, I wonder, the "lucid and tenacious argument" that inspired Lincoln to issue his immortal proclamation? Holding to this doctrine of the invincibility of "negrophobia," it was only natural that Dr. Bacon, when the people of New Haven, with Judge Daggett at their head, rose up in a tempest of wrath to prevent the establishment in that city of a manual labor school for

negroes, should have had no plea to make for the education of the colored race. And when the Legislature of Connecticut, under the inspiration of leading colonizationists, passed a law making it a crime to give instruction in that State to any colored child from another State; and when that noble Quaker woman, Prudence Crandall, broke the law and was sent to jail,—it was equally natural that Dr. Bacon should look on in silence.

When all the efforts, vigilantly pursued for years, to put the abolitionists down, had utterly failed, and their movement had become a power that could be no longer successfully resisted; and when the Mexican war opened even the eyes of the blind to the designs of the slave power,—then it was that Dr. Bacon and his followers wheeled into line, and did good service in resisting the further encroachments of slavery. I do not begrudge those men their penny—nay, I would even increase their wages a hundred-fold; but the claim that they bore the heat and burden of the day, and should be crowned as leaders, I resent as a fraud upon history.

Whatever light President Lincoln may have gained from the writings of Dr. Bacon, it is certain that he did not recognize him as the leader of the antislavery movement. When he wished to avail himself of the advice of the oldest and wisest of the antislavery host, it was not Dr. Bacon, but Garrison, who was invited to the White House; and when he sought to honor that host in the person of its truest representative, it was Garrison who was officially invited to witness the raising of the redeemed and regenerated flag above the battered walls of Sumter. And when the victorious antislavery workers, including all the great leaders of the Republican party, desired to testify their grateful appreciation of the labors of the man who, above all others, was the founder of the grand movement, they did not so much as think of Dr. Bacon, but joined in placing in Garrison's hands the sum of thirty thousand dollars as a support for him in his declining years.

Dr. Bacon wishes "the ingenuous youth of America" to understand that "Mr. Garrison and his society never succeeded in anything," and that "the final extinction of slavery was accomplished in pursuance of principles that he abhorred." What principles are here referred to I am at a loss to conceive. If they were in any sense antislavery principles, certainly Mr. Garrison was far enough from abhorring them. Does Dr. Bacon mean to accuse the Republican party of opposing slavery on principles that were *not* antislavery? As to measures, Mr. Garrison, it is true, did not always agree with the party,—as, for instance, when it set itself about returning fugitive slaves and refused to abolish slavery in the District of Columbia, as an inducement to the rebellious South to return to the Union; but these measures can hardly have been adopted "in pursuance" of any principles deserving to be called antislavery. The one great measure for which Mr. Garrison contended was immediate emancipation, and "the final extinction of slavery was accomplished" in just that way. The freedmen, moreover, were not colonized in Africa, as Dr. Bacon said they ought to be, but emancipated on the soil, and made citizens of the United States. What is more, Mr. Garrison had his way in the final annulment of those compromises of the Constitution which he said were "a covenant with death and an agreement with hell." Nothing is more certain than that "the ingenuous youth of America," to the end of time, will discern in all this a measure of success justifying the words of that noble Englishman, John Bright: "To Mr. Garrison it has been given, in a manner not often permitted to those who do great things of this kind, to see the ripe fruit of his vast labors,"—a measure of success, moreover, which came as a fit reward of the devotion and self-sacrifice of a life of which Whittier, our American poet of freedom, has said that "its fitting garland should be the Alpine flower that symbolizes noble purity."

Oliver Johnson.

On Culture in New England Villages.*

ARE there any truths, any facts, that the story-teller is bound to respect? Mrs. Stowe's "Old Town Folks" takes us into the very heart of a New England community a hundred years ago. We hear its racy speech, its dialect,—which was not simply bad grammar and false pronunciation,—its brave defiance, its bold orthodoxy, and feel its deep, underlying humility. Behind the veil of Hawthorne's weird and somber imagination throbs the real, actual life of the times of which he wrote, and generations yet to come will turn to his pages, finding there the very souls of their ancestors as well as the records of their ways, their dress, their food, their modes of speech.

Old New England is well taken care of. But what kind of an idea will our descendants form of country life and manners in the New England of to-day, if they take some of its own story-tellers as its exponents.

For example: In a recent number of one of our best periodicals, there is a story of to-day, the scene of which is laid in an Eastern village, whose name is given, so there is no room for doubt. We know that this town has its railroads, its telegraphs, its marble quarries, its well-tilled, profitable farms. It has good schools and substantial churches. It takes the city dailies and the best magazines. It is next door, as it were, to an academy of more than local repute, which sends many of its students to Harvard, Yale, and other colleges. Now, does any one suppose that such a town would tolerate, year after year, in its most influential pulpit, a clergyman who persistently violated the plainest rules of grammar, and all the proprieties of English speech? The "parsons" of New England are educated men, men of thought and culture. As a rule they are the conservators, not the violators, of refinement and good-breeding. They do not vex the ears of the dying saints to whom they would administer consolation by saying "scripter," nor "continooally," nor "speritooal," nor "sech." Men of enough social standing and influence to be elected deacons in the principal church of a thriving, intelligent New England town, do not to-day speak of their young daughters as "gals," nor do their wives interlard their speech with such choice morsels as "I haven't nothin' to say to sech remarks." The leading "ladies" of such towns, even if their leadership has

* [Mrs. Dorr's remarks are an unintended supplement to Mr. Warner's, in this number of THE CENTURY.—EDITOR.]

more to do with church sociables and sewing societies than with five-o'clock teas, are certainly not guilty, nowadays, of such solecisms of speech and manner as they are charged with in this and kindred stories. A provincialism is one thing; gross ignorance or vulgarity is quite another. A recent critic, speaking of Mr. Howells's Marcia, says: "There are girls, even in village life, whose horizon is wider, whose culture is more generous." But why that somewhat condescending "even"?

Let me give an outline of what is going on this winter in, at least, one New England village. It has had for ten years or more its Shakspere Club, under most competent leadership. Under the suggestive name of "Friends in Council," a company of women meet on every alternate Wednesday from the first of October to the last of May. A scheme of study is made out a full year in advance. Each member knows just what is expected of her, just what thought or knowledge she must contribute for the general good. Greek, Roman, and mediæval history have been successively studied, with the aid of books, charts, pictures, essays, and talks. The contemporaneous history of the fourteenth and fifteenth centuries is the study of this winter. This society, limited by its constitution to twenty-five members, has very little red tape, no "refreshments" of a material sort. It aims at doing solid work, and it does it. Four years ago another society, having a somewhat wider scope, was formed in the same village. It is called "The Fortnightly," and is under the auspices of one of the churches, meeting in the church parlors on alternate Saturdays. Any woman, or girl over sixteen, whose name is presented with proper indorsements, can become a member of "The Fortnightly" by signing the constitution and the payment of a small annual fee. It embraces all ranks—from the wives and daughters of governors and senators to sewing and shop girls, and they meet on terms of perfect equality. It has three standing committees—one on benevolent work, one on studies, and one called the social committee.

"The Fortnightly," ever since its formation, has had large and enthusiastic classes on history, art, and literature; and it cares for a mission school. This winter its members are studying the lives and works of representative women—biography, rather than history. At each of its regular meetings there are essays, readings, recitations, and talks.

Two book clubs, and several musical associations and reading societies keep, at least, this one village from the dull torpor, the intellectual stagnation, on which some of our American novelists dilate with such unction in their stories of country life. The truth is that the quieter lives of country-women give them some advantages over their city sisters. It is they who during the long winter evenings do the reading and thinking. Books take the place of the dinner-party, the dance, the opera.

Julia C. R. Dorr.

Will the Jews Return to Palestine?*

MISS EMMA LAZARUS has won such merited praise for her warm and impassioned championship, both in verse and prose, of the Jewish race, that it may seem ungracious in an American Israelite—who has long been aware of her genius and powers—to take exception to the logic and tendency of the article from her vigorous pen in the February issue of your magazine, under the title "The Jewish Problem." But the importance of the subject referred to and the necessity of due caution in its discussion lead me to regret that Miss Lazarus has written in so positive and unqualified a strain. I refer, not to her just and admirable summary of Jewish history, but to her advocacy of a separate Jewish nationality.

1. It is most assuredly an exaggeration to state that "whenever two Israelites of ordinary intelligence come together, the possibility, nay the probability, of again forming a united nation is seriously discussed."

2. To Mr. Oliphant's personal efforts in behalf of the persecuted Russian Hebrews, I bear grateful testimony; but the difficulties in the way of colonizing at present a strip of land in Gilead—his special project—which have been pointed out by experienced critics, counterbalance, in my opinion, the extravagant laudations of a few enthusiastic advocates, who, because Scripture has been interpreted as predicting the restoration of Palestine to the Jews, deem it a religious duty to favor every scheme for its colonization. Neither the land nor the Jewish people is ready for such a utopian movement. When the Turk is expelled from Europe, and the Jewish proletariat abroad—who alone appear most desirous of emigration—are better equipped for industrial and agricultural work, it is a possibility that the fertile valleys of Palestine may be settled by colonists—but not by large numbers, who will be attracted elsewhere.

3. It is most unfortunate that Miss Lazarus cites the views of a young Russian Jew as summing up "the desires and ambitions of the nation." Among such views it is stated that "the religious mission of the Jews belongs to the past." No objection is made to intermarriage, and a central government, either in Palestine or South America, is advocated. If the mission of Judaism is past, the Russian Jews might save all further persecution by becoming Christians. If it be true that "the racial tie binds Jews together, even though they discard all religion," why form a separate nationality, unless to establish a little free religious and atheistic *commune*, under the Jewish name? Certainly a new Ezra, whom Miss Lazarus states the Jews of our generation "can surely furnish," if he be at all worthy of his ancient namesake, would be rather uncomfortable for such utopians.

4. It is unwise to advocate a separate nationality for the Jews at a time when anti-Semites are creating the impression that Jews can never be patriots, but are only Palestinians, Semites, Orientals. In fact, at the recent Anti-Semitic Dresden Congress, it was resolved that the Jews be sent back to Palestine. Even those Jews who share the traditional belief in a future restoration,—and who are rather proud of being recognized as Americans in America, Frenchmen in France, Englishmen in England, and so on in every land which guarantees them civil and religious liberty,—would resent such a polite invitation. In fact, to advocate such a plan now, in this century of political emancipation in every country save Russia, Roumania, and Coney Island, is a tacit confession that our

* [See Sidney Lanier on this subject,—page 131.—EDITOR.]

enemies are right, and that the Jews cannot be patriots, and have no fatherland but Palestine. There are, however, reverent Israelites,—among them some of our most scholarly and representative rabbis,—who think that Judaism's best work has been done outside of Palestine, and believe that the traditional view about a literal restoration must be modified or abandoned. At any rate, the most conservative Jew will understand that if, in Miss Lazarus' words, "it has been reserved for Christians to proclaim the speedy advent of that Jewish triumph"—the restoration—the conversion of the Jews is an event generally associated by pious Christians with the final ingathering of the Jewish nation.

5. But, it may be asked, if the prospect of emigration *en masse* to Palestine and the establishment of a separate nationality be denied them, what hope is afforded the million and more Russian Israelites, and the several hundred thousand in Roumania, belonging to the poorer classes? The answer is, they must remain where they are, and it is the duty of their leaders and spokesmen to champion their rights, even as the German Israelites have finally acquired their political emancipation. It has been a long contest in Germany since Moses Mendelssohn taught the German that the Jew could be both a man and a brother. Let the Russian Mendelssohn, let the Russian Heine, let the Russian Börne, let the Russian Zunz and Riesser and the rest, step forward and champion their brethren at the bar of European public opinion. The world will respect such action as indicative of a nobler manhood and a higher faith. Riesser did not spare his own brethren. Mendelssohn and his school fought the bigotry and superstition which degraded their co-religionists, and made their religion a mass of antiquated forms and nerveless practices. Let the true restoration be preached to the hundreds of thousands who are ignorant of modern culture and modern industries. Let the best preparation for citizenship in enlightened lands begin in the scattered towns and governments of Russia by better schools and improved facilities for training the children, so that they may be transformed into men akin in spirit and aim to the brilliant writers, poets, philanthropists, and statesmen who are the pride and boast of other lands, where once the stone of reproach weighed heavily upon the Jew, which he has bravely rolled away. To begin this work is the duty primarily of the wealthy Russian Israelite; and the example of a few like Baron Guinzberg, Abraham Brodsky, and Poliakoff, is worthy of wider and more general emulation. Nor can it be doubted that in such a movement might be enlisted the aid of the "Alliance Israélite"—which was not founded to colonize Palestine, but to educate the illiterate Jewish population of the East, and plant schools in all directions. If, in addition to such efforts on the part of Jews to secure political emancipation and social and educational reform, the Church shall more generally imitate the action of a few of its representatives in Russia, and strive to awaken a Christianity more in accord with the gentle teachings of its Founder,—who can doubt that in a decade or two the Jewish problem in Russia will have been solved, and the Russian Israelite will have no more ground of complaint than his brethren in France, England, and America?

In the brief space necessarily accorded a communication of this kind, and in a magazine like THE CENTURY, I have not attempted any detailed criticism. Let me add that paper schemes for the colonization of Palestine, which are chronicled with all the gravity of an item about the sea-serpent, are not original with Mr. Oliphant or George Eliot. In the "New York World," of September 28, 1866, Mr. Henry Durand, of Geneva, Switzerland, had a far more practicable plea for the settlement of Palestine by Jew and Christian, and the revival of the Orient by the development of its industry and commerce. It was expected by Mr. Durand and his friends that the Jews would aid, Turkey would coöperate, the Rothschilds provide capital, and the Emperor Napoleon give his support. But Mr. Durand's scheme shared the fate of all the pseudo-Messiahs who appear in the East from time to time—it ended in smoke; and so will every attempt, under present circumstances, to colonize Palestine on any large scale with a view of organizing a Jewish nation. That such a phantasy should be seriously advocated in our day is not so surprising when one reflects that the present whereabouts of the Ten Tribes still forms a subject of effervescent dispute, and within recent years a unique literature has appeared devoted to the claims of the Anglo-Saxon race to be considered their lineal descendants. It is only in England, perhaps, that such ideas can germinate "with miraculous rapidity."

Abram S. Isaacs.

On Higher Education for Women.

DEAR MR. EDITOR: I know that you'll think it perfectly horrid of me and too forward and dreadful for anything to write to you in this bold way without knowing you at all, but I *do* hope that you'll excuse me, as there is something I feel it my duty to write to you about. (It seems too funny to write "Mr." instead of "Miss" or "Mrs.," as I most always do, for upon my word and honor, I never, never wrote to a gentleman before except once when I ———) But any way, I feel ever so safe, as you can't possibly know what my monogram stands for, and my signature is *ex officio*, or whatever you call it when you don't give your real name. But as I was saying, I want to speak to you about this just too dreadful fuss they are all making about what they call higher education for women and coeducation. Horrid, tiresome old things, I'd just like to shake them.

Why, I declare! It's simply too ridiculous for anything, the way they go on; just as if any sensible girl, with any sort of romantic feelings, wanted to know anything about Greek and philosophy and things, and then grow up for all the world like those absurdly dreadful old frights that wear spectacles, and have straight hair brushed back, and sleeves that never fit at the shoulders, and carry their change in a bag, and ask for the "franchise" (whatever that is), and make all kinds of ridiculous plans, and don't know any more about flirting or dancing the German than the man in the moon. It quite makes the cold shivers run down my back to think of them. (Don't you consider this description just too awfully cutting and sarcastic for anything?)

I know well enough that they tell all of us girls that what women need is more *real* knowledge; but,

I'm sure, *I* simply can't see the good of it. It's awfully true as the poet says, "What is knowledge but grieving?" (Don't you consider Owen Meredith just too splendid and grand for this world? I quite dote on that sweet and dreamy Lucille.)

I'm sure you can get all the knowledge and accomplishments you want at lots and lots of establishments like Madame de Sagesse's. (Why, they even teach calisthenics there!) That's where I graduated last spring, and they gave me a diploma which was just every bit as large as the one Cousin Jack took at college ever and ever so many years ago, and exactly like it, only it was in English and didn't have a lot of letters after my name like his — A. B. or Ph. B. or whatever they are, just as if you were a drawing pencil and had to be stamped to show if you were very, *very* soft or only middling. But it was thick and crackly and real, *real* parchment; and it was tied with the most lovely shade of *clair de lune* blue that you ever saw in all your born days, "*gros grain*," too, and must have cost, oh! ever and ever so much a yard. French I think, because it exactly matched the bows on my white muslin. (Worth!) It was just too becoming to live, as Cousin Jack said. (I've ripped off one of the bows and send it to you around this manuscript, it looks so neat. You can keep it.)

But I am afraid you may think me frivolous and wandering from my subject; but really I feel so awfully nervous at the idea that this will be printed, and that then I will be a real live authoress just like George Eliot, or May Agnes Fleming, or Rosa Bonheur, and lots and lots more, that I really and truly can't write quite my best. (Though, upon my word, I should hope that now, when I have finished my education and received a prize for English composition, my writing is not so awfully bad that I have to apologize for it, because if I thought so, I would just throw it in the fire and burn it, and sink right through the floor, and it would be the death of me, and I would, as Byron says, "wither like a flower and like a flower die." Isn't that sentiment quite too soulful and heavenly? I know it's awfully wicked for a girl to read Byron; but I do just whenever I get a chance, and I think he's perfectly grand and divine, but I haven't read much lately, because the key of the book-case fell down the register last year, and so I can't open it.) Oh, dear me, what a frightfully long parenthesis! Almost a page. But please don't think that I can't keep my mind fixed on one subject, for I can, as you will easily see when I tell you that I was marked "double 10" for Logic, one whole term, while at Madame de Sagesse's.

But I must not let my thoughts wander any more or you may get the idea that I am not serious-minded. It's just too ridiculously preposterous the idea that a girl with any sort of pretension to good looks should just go and ruin her chances by seeming to know anything about all those dreadful mathematics like Soshiology (Dear me! I hope that's spelt correctly, though somehow or other it don't look quite right to me). It only makes all the men afraid of her. So where's the good of it? What's the use of bothering your brains if the men wont like you any better for it?

Then they give another reason for the need of "higher" education, *vis:* That many women are poor and want to earn their own living and want a diploma from a college to certify as to their fitness. As for the diploma, I have shown that you can get it at a school if you think it's going to do you any good. As for being poor, I don't see the need of that either. Why don't they go and live with some relations? Or marry some *rich* man? Or if they are ridiculously stuck up and want to be "independant," why there are lots of ways of making money. They can do spatter-work or worsted work, or paint plaques. It's awfully easy. I never took any drawing lessons at school (because the drawing teacher wasn't a bit young and poetic-looking, as an artist ought to be) and have taken only six painting lessons in my whole life, and yet I paint beautifully (this may seem conceited but it isn't). This winter I made a plaque and only painted seven weeks on it, and sent it to a fair and it sold the very first night for ten dollars. I'm sure that shows it was good. In fact I didn't like to part with it, so I made Cousin Jack promise to buy it for me and he did. He's just devoted to me.

I forgot to tell you that I'm the secretaryess of the North-American — literary — society (no real writers, you know, but only amateurs who could be if they wanted to), and so I have a great deal of experience in reading the very best essays, and I have often noticed that most of those that cry about the "right" of women are those "left" by men. (Isn't that an awfully well turned sentense?)

Anyway, I feel sure that you can get lots of culture now in New York, if you really want it and can get invited to the right places. What with the "Causeries de Lundi" and the "Goethe Lectures" and "Tasso Readings," and "Raphael Conversazione" and "Nineteenth Century Club" and "Biology Class" and so on *ad infantum*. (You see I can quote Latin too, if I want to, but I don't think it's good taste to air your learning — it seems too dogmatic.)

But I shall have to stop now as I am afraid you will (Ought you say *will* here or *shall*?) get angry with me, if I keep you any longer from your printing; and besides, I have a most important engagement with my dressmaker, and anyway if I cross this sheet a third time I am afraid you may, here and there, have some difficulty in reading it *current calamo*.

Beleive (I'm never quite sure whether it is ie or ei, but I haven't time to look for the dictionary) me ——

Yours for health,

PINKIE ROSEBUD.

P. S. — You may have this even if you don't think you can afford to pay all it's worth; but I should like to receive something, so as to be able to say that I have been paid for my writing, because you know that always shows it's good.

P. R.

BRIC-À-BRAC.

Time's Revenge.

When I was ten and she fifteen—
  Ah, me! how fair I thought her.
She treated with disdainful mien
  The homage that I brought her,
And, in a patronizing way,
Would of my shy advances say:
  "It's really quite absurd, you see;
  He's very much too young for me."

I'm twenty now, she twenty-five—
  Well, well! how old she's growing.
I fancy that my suit might thrive
  If pressed again; but, owing
To great discrepancy in age,
Her marked attentions don't engage
  My young affections, for, you see,
  She's really quite too old for me.

Walter Learned.

Childer and Wife.

I was going home, one snowy winter day,
When a poor old creature stopped my weary way.
  Have you any pennies?" (crouching like a slave)
"For I have two childer, and their mother's in the grave."

Though I have a wife, I don't care much for pelf
When I meet a man who is poorer than myself;
Beaten by the world, I feel no longer brave,
For my two children are lying in the grave!

I gave my brother pauper pennies four or five—
Enough, I hope, to keep him another hour alive.
My pocket was opened by the reasons that he gave,—
His two little children, and their mother in the grave!

Richard Henry Stoddard.

Song.

If you love me, come and be
In my heart of hearts, and see
How I think of naught but thee!

If you hate me, tell me so;
I should love you still, I know:
Hate to love will sometimes grow.

If you neither love nor hate,
For your grace I ne'er will wait;
You will never be my fate.

Oscar Fay Adams.

Aphorisms from the Quarters.

Your luck aint always ekul to de lenk o' your fishin'-pole.

Grass don't grow high roun' de corn-crib.

De man aint put togedder right dat don't lub his own dorg.

Sunset mighty pretty to de plow-hand.

It takes a hones' miller to keep lean shotes.

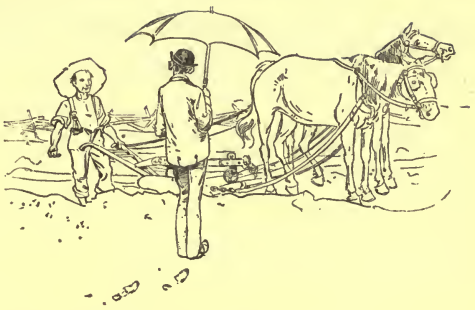
Don't kill de old goose in sight o' de fedder-bed.

De full moon is a po' han' to keep secrets.

Old hen got 'nough l'arnin to tell her own chillun in de dark.

J. A. Macon.

Plowing.



Good mornin', sir! A clearin' sky—
What? Want to talk with me, sir?
You tracked across that piece o' rye,
But we wont disagree, sir.

I'm sure yer welcome on this sod.
The piece was heavy-seeded;
The finest catch there, where you trod,
Since the old farm was deeded.

Whoa, boy! It's gettin' warm ag'in—
That colt is just a-learnin'—
Come, boy! Come Fan, come in! *Come in!*
They're rather slow a-turnin'.

The air, I guess, don't smell so sweet
Where you live, in the city,
No grass or shade-trees on the street?
Now, that must be a pity.

I calculate a farmer lacks
Some things you make a show of;
But there may be some curious facts
That city folks don't know of.

You see the nest on that pine-bough?
Do you know what there's hid in't?
D'ye know what bird 'tis singin' now?
No? Well, I thought you didn't.

You mus'n't think a pleasin' thing
Is lost on country people;
The birds that in that maple sing
Beat chimes in any steeple.

And as for good, fresh thinkin' stuff,
Paved streets can't be so givin';
While this one field has got enough
To last you while you're livin'.

Kin Boston beat that row of stumps
The little lot is fenced with?
Who-o-o-a! Woodchuck holes are wuss'n mumps!
The beasts might be dispensed with.

You'd like to hold the plow awhile?
All right, sir. I am willin'.
Whoa there, I say! Don't go *a mile!*
You'd ought to kept its *bill in.*

What threw the plow out? Oh, a stone
They're rather *apt* to turn her.
I guess I'll go it best alone—
You do well for a learner.

Why, I have seen men lean and try
To push the plow before 'em!
'Twould make a horse laugh till he'd cry;
But one fool makes a quorum.

I s'pose they think that Kingdom Come
Depends on them for motion;
But of the Power that's pullin' some
They haven't the slightest notion.

It's like good times to plow sod loam,—
To hear the coulter rippin',
And the soft earth, like fallin' foam,
Into the furrer drippin'.

But when you strike a stretch o' stone
It's sickness and low prices!
The plow not only shakes each bone
But kinder wakes yer vices.

A plow's a contrary concern,
A young calf can't out-do it;
To guide the point the handles turn
The opposite way to it.

Cut furrer wide, lean handles right—
You know how 'tis, I dare say—
Lift up, and it dives out of sight,
And t'other way, vice versey.

Not married? Well, you'll hardly swim
Before you go in swimmin';
But p'raps you'll find that in this whim
A plow is like some wimmin!

Nags like the furrer—softer ground—
Their crowdin's apt to balk us;
They're like two politicians bound
To carry the same caucus.

The colt lags, don't he? 'Pon my soul,
I guess the mare's the stronger!
I'll move that clevis up a hole
And make his end the longer.

Young hoss, if you don't stop that prank
I'm 'fraid you'll get a floggin'.
This knoll grows quack-grass mighty rank—
The meanest stuff for cloggin'!

I'm blamed if quack-grass aint like sin,
It grows where land's the poorest;
Ag'in a hoe it's sure to win—
Guess buryin's the surest.

I tried a new plow at the fair;
'Twas neat, but I refused it.
This "Rough and Ready" stands the tear,
And our folks allus used it.

Old plows and old beliefs are strong,
And good yet if kept shinin'!
Things that have stood the strain so long
Kin stand *some* underminin'.

I like to watch before the plow
The grass a-tumblin' over;
The big and little have to bow,
The June-grass and the clover.

A plow reminds me, then, of Time.
Does't other folks, I wonder?
There goes a violet in its prime—
I hate to turn *them* under.

But when above the buried weeds
The yellow wheat is wavin',
'Twill teach that buried years and deeds
Still live, if worth the savin'.

A life-time dwindles like these lands
In which the lot's divided;
When the dead-furrer's reached one stands
And wonders where it's slided.

Tell how I run a furrer straight,
And keep my sights when sowin'?
Yer competition would be late,
So I don't mind yer knowin'.

I set that pole this side the lot,
Then start from over yonder,
And range that pole with some fur spot
And never let it wander.

I've sometimes thought if we would range
Our daily walk with Natur',
Our lives with things that never change,
We'd draw our furrer straighter.

I'm apt at preachin'? So I've heard.
Yes, I 'tend church on Sunday.
Why, if I didn't hear the Word
I couldn't work on Monday.

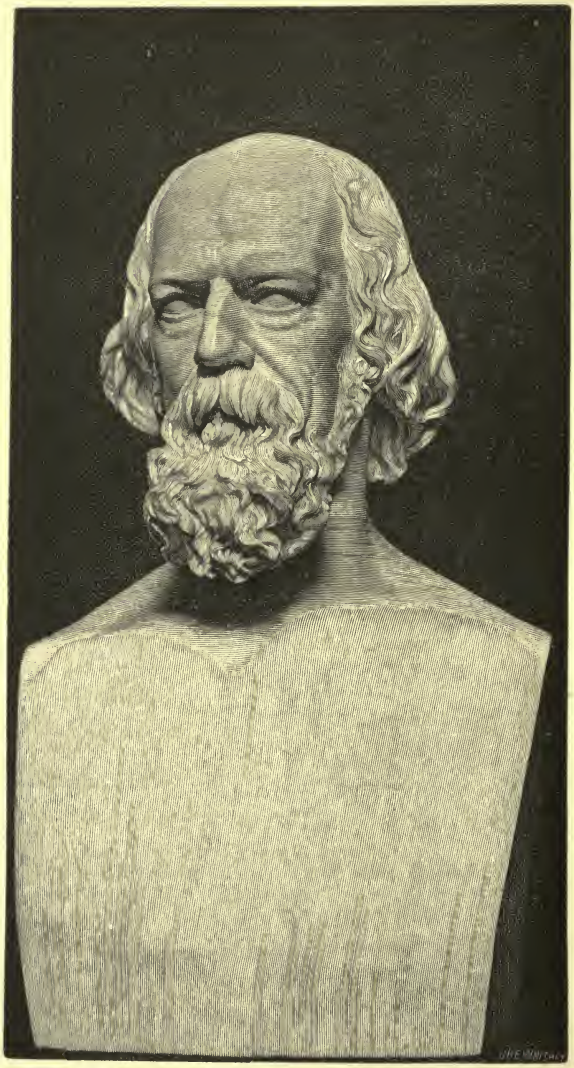
Ah, ha! That whistle blows for noon,
And dinner-time, I'm thinkin';
Well, I don't think it blows too soon,—
I feel like eatin' an' drinkin'.

Ned's callin' me, my little son,—
Jest five years ter his story;—
He makes us seven, countin' one
That's now a child o' glory.

How proud that team steps now that they
Are p'intin' for the stable!
A pretty tune their trappin's play,
Judgin' as I am able.

Come in the house and see my Nell—
I think she aint bad-lookin'—
And she's just as reliable
At counselin' as cookin'!

Charles H. Crandall.



(ALFRED TENNYSON, AFTER A BUST BY THOMAS WOOLNER.)

THE CENTURY MAGAZINE.

VOL. XXVI. JUNE, 1883. No. 2.

LIVING ENGLISH SCULPTORS.

I.

IT is a very impressive moment to the lover of sculpture when he stands by the ivy-grown tomb of Thorwaldsen in Copenhagen, and sees around him those stately and noiseless galleries in which rest the masterpieces of the father of modern plastic art. Nature loves to refresh the pools of thought with water brought from distant and sequestered springs, and nourishes her Winckelmanns in the arid wastes of Brunswick, and brings forth her Thorwaldsens from a squalid village in Iceland. By this means she renews her ancient forces; for in art, as in everything else, her process is one of birth, of perfection, of decay, and of birth again out of decay. During certain long periods of history, sculpture has hardly existed in Europe. When the last Roman revival of Greek sculpture ceased, there was an absolute eclipse till Christian art began to carve the fronts of Wells and Pisa. Less obvious but as real eclipse darkened the two centuries that lie between the manhood of Bernini and the youth of Thorwaldsen,—a period not indeed unprovided with statues and busts, but permeated by ignorance and false taste to such a degree that the revival of the art seemed absolutely hopeless. In every part of the west of Europe this dark age of sculpture has left its mark, often signed by names of those to whom we pay all possible positive honor, though denying their relative position,—such artists as Roubillac with his astonishing swiftness and versatility, as Bacon with his virile force, as Canova with his prescience of a better age that was coming and with his wonderful skill in technique. Yet these and many other sculptors, who achieved reputation in the seventeenth and more particularly late in the eighteenth century, leave us dissatisfied with their aim and vision. If they strive to be classical, they are removed so many degrees from the simple and learned beauty of the Greeks, that we find them, on the whole, insipid; if their aim is to be Christian, they are so deeply impregnated with conventional elegance and so bound by a series of acknowledged symbols, that we are neither solemnized nor touched, for the element of spiritual surprise is carefully avoided. We find that skill has entirely taken the place of sentiment, and workmanship of imagination; yet, by a curious irony of nature, the technique for which everything has been sacrificed has almost every fault except that of rudeness. The "Graces" of that excessively clever carver, Canova, by dint of over-elaboration, seem to simper at every joint of their polished bodies, and their fingers, in excess of flexibility, cling to their flesh like leeches. Thus a man of unusual talent, a workman of the first order, fails in the very matter of modeling through ignorance of the true principles of his art; he knows not what to select or what to avoid. Into this false atmosphere, charged with bad taste and erroneous ambition, Thorwaldsen brought his eager northern spirit, rugged and sincere, and led the way for great and essential changes.

Unfortunately he, too, was brought up in a false school, and kept under vicious authority too long to perform all that his genius might have effected. He was ill-equipped in many technical respects, lazy as a workman, only very occasionally inspired by great and original ideas,—a man of strange contradictions, now brilliantly enterprising, now indolently dull. Some of his most famous work can in no way be esteemed better or even different in character from the conventional

[Copyright, 1883, by THE CENTURY CO. All rights reserved.]

work of the century before him. The visitor to Cambridge must pronounce that, as he is there revealed, he cuts a sorry figure by the side of the vigorous Roubillac. And therefore I began by saying that the student of modern sculpture must make a pilgrimage to Copenhagen. There, as he wanders among the countless plaster works which bear still the impress of Thorwaldsen's hand, he may see, what he misses in the smooth and facile marbles carved often in the absence of the indifferent sculptor, how the ancient fire was sometimes rekindled between those uncertain fingers and the true principles of sculpture revealed to that sluggish brain. Standing before the "Mercury" of Thorwaldsen, that noble figure of adolescence, the whole attitude of which breathes a lyric simplicity and grace,—noting the vivid eye, the absorbed features, the finely modeled hands lifting the pipes,—I have been inclined to fancy that the spirit of pure sculpture, which fled from the world when Goujon fell, shot to the heart, from the relievo he was carving on the day of the Massacre of St. Bartholomew, came back to earth with timid flight while Thorwaldsen was fashioning this statue.

What Thorwaldsen partly performed in the way of recalling plastic art to truth and sincerity of expression was carried much further and in a finer spirit by an artist of our own race. The divine Flaxman—to whom England alone of all the countries of Europe has been slow to do honor, that great poet of design in whom our critics will perhaps one day learn to recognize the greatest ornament of English art—saw through the medium of his keen and learned imagination all that was needed to revive the practice of sculpture. Before the light of his intuition all the finery and flummery of Italian false taste, all the dull traditions and pompous Latinities that the French had laid down as law to Europe, all the burden of detail, all the dread of vitality, passed away like a vapor, and he saw life and man as the Greeks saw them. Where then, it may be asked, are the statues of this great sculptor? What museum is crowded with his figures, what church with his reliefs? To this we all know the melancholy answer. He lived at a period and in a country that were blind to the value of such work as his; the ignorance of his rich contemporaries put so few commissions of the grander sort within his reach, that his hand never quite attained that sureness and vigor of workmanship which must always come with use; and accordingly, the exquisite and nobly sculpturesque dreams with which his brain was always brimming were expended on the decoration of plates and cups, or drag out a dubious existence on scraps of paper. If the English Government or the wealthy classes in England had known what manner of man was moving so quietly among them, they might have won the gratitude of posterity by supplying him with bronze and marble. There is something exceedingly irritating in the reflection that a Bernini can always secure abundance of material on which to perpetuate his monstrous taste, and yet that, when once in five hundred years a Flaxman is born, the wealthiest nation in the world cannot find him blocks of marble to work upon.

The legacy of Flaxman to us, therefore, is almost intellectual rather than physical. His matchless designs pathetically cry to the student: "Thus I should have modeled if the world had cared to let me; work thus if you are born into a more intelligent age than I was." And it is from his drawings rather than from his executed works that we must gather his message to posterity. His immediate followers did not understand his mission. They sought to imitate the exact practice of Flaxman in individual cases, instead of trying to look at nature and the human body from his free and original standpoint. So that once more the attempt to revive sculpture, in the broader sense, as a great imaginative medium, failed for want of courage and instinct in those who trod in the steps of Flaxman. Sculpture fell lower than ever, reaching throughout Europe, about fifty years ago, a condition of nullity and poverty greater than, perhaps, at any moment, even in the unlucky eighteenth century.

Germany had revived the judicious love of antiquity; Denmark and England had successively indicated the direction of revival; it was left to France to carry out this newest *renaissance*, and make sculpture once more take rank among the living arts. It was François Rude, the great sculptor of Dijon, who brought to this task the needful combination of skill and intelligence, and who first dared to set entirely aside those rules and exceptions, traditional bondage of the schools, which every sculptor had bowed down to until his time. It is no part of my business here to tell the story of Rude's life, or chronicle the successes of French sculpture. The first has often been done for English readers, and particularly well by Mr. Hamerton in his charming book called "Modern Frenchmen"; the second is obvious to any one who visits Paris with discerning eyes. But, before proceeding to discuss what has been done of late in England by a group of artists whose inspiration comes more or less from the true modern source, I must quote one phrase of Rude's which is very significant in its bearing on

VIRGILIA. (THOMAS WOOLNER.)

sculptors' work. Rude was a rough man, not given much to writing or reading, but his disciples have preserved for us some of his apothegms, and they are wonderfully wise. To some one who asked him how he would define the human body, he replied, "As a skeleton, of which the muscles form the ornament." It is easy to see that a man with such a doctrine of his art could not go far wrong, and the acceptance or disregard of this seems at the root of all failure or success. The ancient Greek who modeled his queer archaic figure of Phœbus was thinking mainly about the skeleton; we see the ribs correctly indicated, the slope of the pelvis and even the contours of the thigh-bones excellently suggested, and we take great pleasure in looking at the statuette, though its ornaments —its muscles and skin—and the modeling of the face are very rude and poor. We take, for instance, much more pleasure in it than we do in the late Roman statue of the same god, where the skin is polished, the features exquisitely even, and the muscles laid on with every affectation of elegance, but where the bony structure is absolutely neglected or treated in slavish accordance with some traditional practice of Praxiteles or Polycletus. For it is a very remarkable fact, of which the history of art is forever repeating examples, that the artist injects into his work the charm of his conscientious effort,

and that what is carelessly done, or done in the spirit of a charlatan, or even ignorantly and tamely done, may please the world for awhile and secure ephemeral applause, but cannot long arrest the attention of any unbiased company of observers.

Sincerity, then, and study of nature must be the leading forces of sculpture if it is to regain its authority over human thought; and these must be exercised in a large sense by men of remarkable power, moving in a bracing and strenuous atmosphere of intellectual effort. No doubt there is a species of monumental and iconic sculpture,—memorial figures and portrait busts,—in which at all times, whether the art rises or falls, honest workmen will achieve tolerable results. In England, at the darkest periods of our art, we have had sculptors like Nollekens and Behnes who produced contemporary heads which were entirely satisfactory,—valuable documents, precious to students of history, and well executed as works of art. But portraiture is, after all, though the most prosperous and necessary branch of sculpture, not its noblest, and not that which feels most sensitively the spring or winter of the imagination. It is in ideal work, in the poetic creations of the sculptor's mind, that we see most readily whether his mode of work is sound or not. Now it may seem to some readers a bold thing to say, and yet is merely a truism to those who think on the subject, that so great has been the general rise in sincere and capable treatment of sculpture in the French schools within two generations, that any one who visits the Salon at Paris will see, even in an unfavorable year, several imaginative statues which show more real knowledge of the body, a truer sense of beauty, a livelier fidelity to pure Greek feeling, than is to be found in all Canova's work, in most of Thorwaldsen's work, and in all else that Europe produced in sculpture from the death of Bernini (1680) until the present age. We need to have this said plainly, and to clear our minds of tradition and prejudice. If we want to see what is truly beautiful in sculpture, let us look at such fragments of genuine old Greek work, down to the age of Praxiteles, as the piety of the modern world has collected out of chaos; in Christian sculpture at the alto-relievos of Ghiberti, the penciled bass-reliefs of Donatello, the saintly terra-cottas of Della Robbia, and the virile monuments of the pagan Italians from Verrochio down to Michelangelo; then at nothing else, however much the amateurs of two centuries may have praised it, until we come to the work of Frenchmen who are not yet old, Chapu and Dubois, Falguière and Mercié.

The poverty of English sculpture has been due to the fact that, not having the force of the Middle Ages, when, as it seems, sculpture was rediscovered for Europe by the Englishmen who built Wells Cathedral,—not having, I say, the force of the thirteenth century, it was obliged to move in bondage to the old traditions, copying not Greek art, but wretched Roman imitations of Greek art, not Michelangelo and the manly Italians before him, but the feebly furious school that aped his mannerisms, erring everywhere through timidity and half-heartedness, contented, as we see the Italians of to-day contented, to be executants and not composers, servants, not masters, unrivaled workmen in the technical part of their trade, but without any creative talent, without courage, without taste. We may take Foley as a very fair example of the best sort of sculptor that the old tradition could produce in England,—a man equipped as a workman at all points; practically without fault, in his best time, as far as the superficial part of the modeling goes and in crafty treatment of surface, yet merely a workman at best; without knowledge or the trained instinct that makes up for knowledge; without imagination, content to ring the changes on half-a-dozen vigorous or graceful attitudes; in short, a man of extraordinary native gifts, but ignorant of their meaning and without any just sense of their responsibilities. His statues are simply marvelous pieces of workmanship; they have no sentiment, they suggest no thought. Perhaps his finest work, his truly superb statue of "Caractacus," at the Mansion House, is no contribution to history, and throws no light upon the motives of a savage patriot. It is simply a very fine figure of a naked Englishman, with a large mustache and a very heavy head of hair, looking as though something or another had annoyed him very much. Now if anything is plain in the history of art it is that mere good workmanship, without ideas to guide it, is not self-sufficient for more than a single generation. Sculpture in England has had to begin anew, faintly encouraged, I cannot doubt, by the greater revival across the Channel. The pre-raphaelitism of Mr. Woolner, and the independent movement toward realism of Mr. Armstead, were the first steps toward the light, and we shall briefly discuss these first. They have led the way to a generation of younger artists, who move on the crest of a second wave of revival, a wave much more plainly tending toward us from the shores of France, and of the very highest interest and importance to students of our national art. And this would indeed be the fit place for a brief tribute to the genius of that great and

THOMAS WOOLNER IN HIS STUDIO. (FROM A DRAWING BY T. BLAKE WIRGMAN.)

obscure artist, the late Alfred Stevens, whom we scarcely knew till he was gone from us, and who stood apart from every school with his eyes fixed on the sole figure of Michel-angelo; but this digression would take us too far from the subject of our present inquiry.

II.

THERE is no living artist whose work a man of letters approaches with more instinctive interest than Mr. Woolner, himself almost as eminent a poet as a sculptor. His literary position is not that side of his career which will be discussed here; his place in literature, as the author of "My Beautiful Lady" and of "Pygmalion," has long ago been decided, and needs no re-illustration. But, after all, the profession of Mr. Woolner's life has been sculpture, and it is as a sculptor that he calls for our attention among his most prominent colleagues. Thomas Woolner was born at Hadleigh, in Suffolk, on the 17th of December, 1825. At the age of thirteen, he began life as the pupil of Behnes, sculptor in ordinary to Her Majesty. With all his faults, Behnes was a considerate and intelligent master; and under him Mr. Woolner found, if no encouragement, at least less opposition to his views with regard to the exact reproduction of nature than he would have found, for instance, in the great rival studio — Sir Francis Chantrey's temple of conventionality. At the age of eighteen, just before leaving

HENRY HUGH ARMSTEAD AT WORK. (FROM A DRAWING BY T. BLAKE WIRGMAN.)

Behnes, Mr. Woolner began to exhibit. The catalogue of the Royal Academy for 1843 announces an "Eleanor sucking the Poison from Edward's Wound," which has disappeared; and there was shown at the same time in Westminster Hall a large group of "The Death of Boadicea," which no longer exists. The first work of Mr. Woolner's which can still be examined is a "Puck," completed at the close of 1843, when he had just started in life on his own merits. It is a work of extraordinary interest. The body of the sinewy little imp is closely modeled after nature; the snake which creeps between his legs, the toad on which he is about to stamp, the broad fungus that supports the whole group,—all these are rendered with that exact observance of truth in detail which was so soon to become the great new power in art. One touch of observation in this work—the rotten leaves being drawn downward by worms—so struck Tennyson years afterward, that into "Enid," which he happened to be then writing, he introduced the famous simile:

"Souls the old serpent long had drawn
Down, as the worm draws in the withered leaf
And makes it earth."

MEMORIAL TO FREDERICK WALKER. (HENRY HUGH ARMSTEAD.)

This epoch-making little statue of "Puck," with its unprecedented return to the study of nature in sculpture, was produced just before the beginning of the similar revival in painting, and was in some sort a herald of it. It was by more than a lucky chance that Mr. Woolner was thrown into the company of that celebrated group of lads, mostly younger than himself, whose names have since been so widely known in painting, and of whom Mr. Holman Hunt was the leading spirit. Mr. Woolner formed one of the original Preraphaelite Brotherhood, in company with Mr. Millais, Mr. D. G. Rossetti, and the other less illustrious artists who formed the famous Seven. In 1850, he took a prominent part in bringing out "The Germ,"—that little magazine, so disregarded then, so precious to bibliographers now,—and in its pages he printed the first installments of his poem "My Beautiful Lady." A little before this, in 1848, he had formed the friendship of Mr. Tennyson, then already acknowledged as the coming star in poetry, although still unrecognized by the large public. Mr. Tennyson's lodgings in the north of London were close to Mr. Woolner's studio, and when at last they mutually discovered this fact, an intimacy sprang up between them which has lasted ever since. In 1852, the attention of the artistic world was widely called to Mr. Woolner's name, although the final result of the circumstance was excessively disappointing to the artist himself. Wordsworth having died in 1850, a subscription was at once made to set up a suitable monument to his memory in Westminster Abbey. Forty-two designs were sent in to a general competition, and among these the most admired was that by Mr. Woolner: his old master Behnes, himself a competitor, remarked, in words to which his position gave great weight, his admiration of his pupil's design and his despair for his own. Mr. Woolner's sketch was so widely acknowledged to be the best, that it was with almost universal surprise and indignation that the news was received that the choice of the judges had fallen upon the very unfortunate monument which now does more dishonor than honor to Wordsworth's memory in Westmin-

ster Abbey. This feeble and ugly work was modeled by a sculptor named Thrupp, who was an exhibitor at the Royal Academy for nearly fifty years, but without attaining distinction. Mr. Woolner's sketch remains in his studio, and, as being one of his most remarkable works, deserves particular description. The sculptor had seen Wordsworth but once, in Behnes's studio in 1839, and had no recollection of his appearance, but his collation of accredited portraits and his life-long sympathy with the genius of the man enabled him to give a likeness which the most intimate friends of the poet were eloquent in praising. Wordsworth sits on the central pedestal, dressed like an elderly farmer; his legs are crossed, his right hand is thrust into his bosom, his head is bent forward in reverie. In his left hand he holds a pimpernel, as a blossom at once humble and rustic in character and yet so beautiful as to demand attention. The bass-relief on the front of the pedestal shows Peter Bell, who, in the act of striking the ass, refrains in sudden awe at the presence of the mountains. For the groups flanking the pedestal, and worked out in the round, the sculptor designed Law and Religion. To render these qualities of the soul in sympathy with the genius of Wordsworth, Mr. Woolner sought out a fellow-thinker in Carlyle, and amid the Olympian cloud of tobacco emerging from these two great men's pipes it was finally decided that Law should be depicted by the representation of a father who controls the passion of a sullen boy ("Make him sullen," said Carlyle; "more god-like task that"), and Religion by that of a mother who encourages her little child to pluck a lovely flower, and in the same instant leads the infant mind to the contemplation of the flower's maker, God. Such is the noble and imaginative monument which was so very nearly raised to the memory of Wordsworth, and which may any day, by an accident or a change of studio, be broken up and no longer exist except in memory. It is greatly to be desired that, before it is too late, some wealthy body of devout Wordsworthians should rescue this appropriate and seemly tribute from its perilous condition in plaster. No commission, I should suppose, could, even at this time of day, be so welcome to the poet-sculptor as this which he so nearly received thirty years ago.

In 1854, Mr. Woolner was bitten with the prevalent craze for Australian gold, and went out to Victoria to try his luck at the diggings. After working at several points, not without success, yet not with sufficient to make the toil worth continuing, he proceeded to New South Wales, and made a great "hit" by modeling medallion portraits for the rich Sydney merchants. He was received enthusiastically. It was the first time that any recognized English artist had found his way out to Australia, and the compliment was warmly responded to. Mr. Woolner was so successful in this field of sculpture that he might have remained in Sydney, had not the hope — as it proved, a delusive one — of a very important commission lured him back to London in 1856. He returned, however, to find that his reputation had increased during his absence, and since that year he has very seldom been unrepresented at the annual exhibition of the Royal Academy.

It would serve no good purpose to give in this place a bare list of all that Mr. Woolner has produced during the last quarter of a century. The specimens we are able to engrave of his work will give a very good idea of its average manner, and will exemplify the three different classes into which it falls. Mr. Woolner has taken advantage of his long friendship with Mr. Tennyson to record at various stages of life the outlines of that noble and singular countenance. As early as 1857 he contributed a bronze medallion of the Poet Laureate to the Royal Academy, and another, in high relief, in 1867; while a bust taken in middle life is one of the ornaments of Trinity College Library, Cambridge. In our portrait of the sculptor himself, the artist has represented him as carving another of his most striking busts, that of Carlyle in 1868. Carlyle, like Tennyson, sat very frequently to Mr. Woolner, showing an amusing alacrity in response to any offer of portraiture, the idle arts being for once well employed in handing down his crabbed features to posterity. As the sculptor and the humorist sat together in this contiguity, there would break forth windy war of words, for Carlyle's delight was to confound all the artists of the world, from Phidias downward, in one sweeping denunciation of "fools" and "rascals," and very particularly the Greeks. On the subject of art, of course, his knowledge and his taste were, as Mr. Leslie Stephen says of Dr. Johnson's, a minus quantity. Some of Mr. Woolner's later busts — his Kingsley and his Keble, for instance, in Westminster Abbey — have lost vital truth in the excess and finish that he has expended on them; but others, again, form lasting and worthy records of the eminent men they represent. Such are his busts of Rajah Brooke of Sarawak in 1859, of Sir William Hooker in 1860, of John Henry Newman in 1867, of Darwin in 1870, and of Charles Dickens in 1872.

Of the second class of Mr. Woolner's sculpture, that founded directly upon historic work

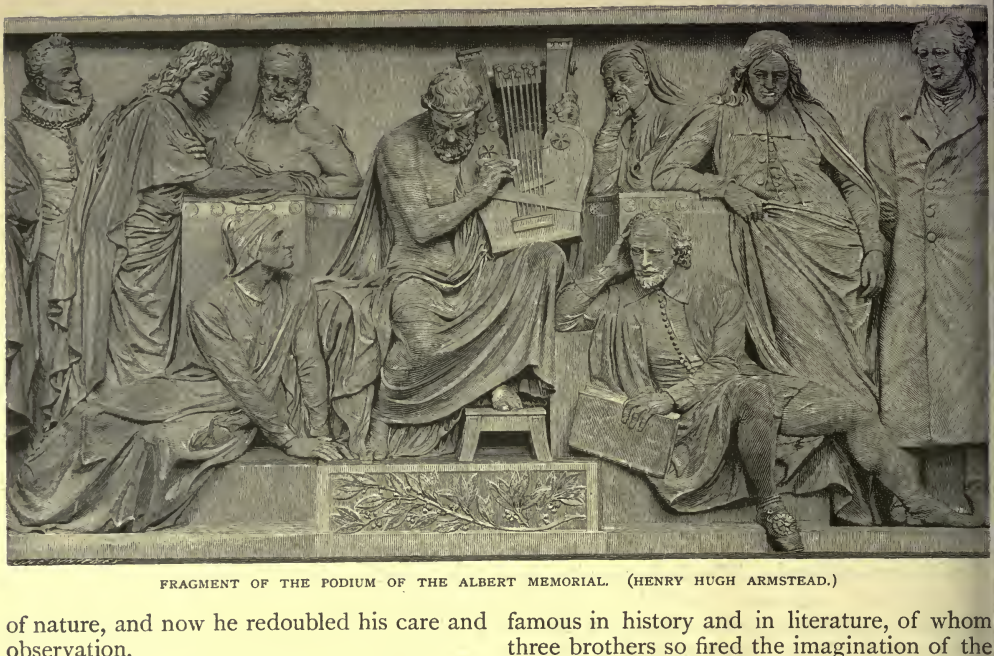
of the imagination, there is no more favorable example to be found than his large and beautiful relief of "Virgilia," of which we give an engraving. The wife of Coriolanus sees in vision her husband routing the Volsces. In the same strenuous manner Mr. Woolner modeled, as his diploma work, on his admission to the full honors of the Royal Academy, a relief of "Pallas and Achilles Shouting in the Trenches." His "Mercury Teaching a Shepherd-Boy to Sing," in 1874, was another of these poetical and refined reliefs. It is a circular composition, in which the god, seated with a lyre in his hands, bends forward over the shy and wondering head of a boy, to whom he teaches the magic by which the learned contrive to make "music and sweet poesy agree."

A fine example of Mr. Woolner's monumental or funeral sculpture is an "In Memoriam" tablet, executed in 1870 for a family of four children who had been carried off at one time by an epidemic. The father waited on Mr. Woolner, and asked him if he thought it possible to erect to their memory a monument which should preserve their features without being extremely painful to the mother. The sculptor undertook to solve the difficulty, and he did so with true poetic tact. He has represented the four children in paradise, full of joy and life, in blithe unconsciousness waiting till those left below on earth shall join them and reunite the family. There is a shade of pensive memory, with no sadness, on the face of the eldest daughter; the second graciously responds to the rapturous ecstasy of her little brother; the third holds out her hand for two butterflies to perch on. This latter incident was criticised, and by no less exact an observer than Mr. Tennyson, as improbable, even in paradise, where the butterflies may, however, surely be conceived as being more confident and courteous than here below; but it appears that there is an earthly precedent for it, for that gentle and patient people, the Japanese, are found to possess the art of taming insects, and in particular of persuading butterflies to perch upon their fingers. It will be seen that the temper of Mr. Woolner's art is joyous and robust; he has not shared the love of melancholy and almost of disease that has been so strange an impulse with many of his most illustrious companions. His conception of sorrow is accidental and transient; his belief in happiness fixed and essential; at least, that is the impression that all which is most successful in his sculpture gives to an observer.

Mr. Woolner was elected an associate of the Royal Academy in 1871, taking rank between poor Frederick Walker and Sir John Gilbert; and in 1876, he succeeded Foley as a full R. A. He lectured as professor of sculpture for a short time at the Royal Academy, and then abandoned the chair, which still remains vacant.

III.

THERE is probably no living artist who more resembles in temper of mind the great Renaissance masters who just preceded Michelangelo than Mr. Armstead. Like Leopardi or Verrocchio, he is prepared by training and laborious accomplishment to be goldsmith, sculptor, or painter, and as a matter of fact he is all these, even the last. His fecundity of invention, his patience as a workman, his untiring intelligence and perfection of style, have all been expended on a great variety of labors, of which but few have received their due reward of public attention, and it is only of late years that the transcendent merits of this great sculptor have been appreciated. Henry Hugh Armstead was born in London, on the 18th of June, 1828. His father, John Armstead, was the most prominent herald chaser of his time, and indeed raised this branch of art into such a perfection as it has not enjoyed before or since. The son was originally to have been trained to continue his father's calling, but he finally started in life as a silversmith. To prepare himself for this delicate work he became a student at the Royal Academy, and passed through all the accredited art training of the day. What special schooling he did not gain from his father came from Baily, the sculptor, whose heavy thumb, however, usually rather marred than mended the minute traceries that the boy already preferred to the "large treatment" then fashionable in sculpture. As a worker in silver, Mr. Armstead performed, in an unobtrusive way for many years, such lovely work as had never before been modeled for this purpose by an English hand, and developed his talent with such rapidity that soon he could not endure to have fine modeling spoiled by the chasers, and learned to do the repoussé work with his own hand. Countless racing cups and vases carry on their lids the results of his fecund imagination and faultless chasing,—work much of which would not be unworthy of a modern Cellini, but which brought its author the minimum of public recognition. While he was still quite young, the preraphaelite movement began to stir beside him; and though he took no active part in it, he was acquainted with its leaders, and felt a reflex warmth fall upon him from their ardor. From the first he had modeled nothing, however trivial, without exact study



FRAGMENT OF THE PODIUM OF THE ALBERT MEMORIAL. (HENRY HUGH ARMSTEAD.)

of nature, and now he redoubled his care and observation.

The climax of his work as a silversmith came in 1860, when he gave months of assiduous labor to the last and greatest of his feats in silver, the "Outram Shield." This masterpiece of delicate and original modeling in very low relief illustrates, in a series of panels which form the exterior of the shield, the romantic events of Sir James Outram's life. They deserve, and, indeed, from the art student demand very close and long attention. So much learning and skill, so much grace in contrivance, so much delicacy in workmanship, so much, in a word, of all that is delightful in modern art, has probably never been expended in vain by any English artist. The result was a masterpiece which nobody looked at with intelligent eyes except half-a-dozen artists and critics; and his wonderful work, not less astounding in its rich completeness than any silver-work of the Italian Renaissance, did not bring its creator the shadow of a single client. Mr. Armstead had performed the work to which all the training of a life-time had been tending, and the result was so crushing that from that time forward he threw up silver-work altogether, and permitted the profession of which he had made an art to degenerate at once into a trade. At the age of thirty-four, he began to be a professional sculptor. The first work that he was engaged upon, after some little skirmishing with book illustration, was a series of mural decorations in stone carving for Eatington Hall, in Warwickshire. In these the sculptor illustrated the adventures of those Shirleys, famous in history and in literature, of whom three brothers so fired the imagination of the age of Elizabeth by their long and romantic captivity among the Persians, their object having been to persuade the Sophi to join in a crusade against the Turks. On this marvelous story the dramatist John Day, in 1607, while all the Shirleys were yet alive, founded his exciting drama of "The Travels of Three English Brothers," and now, after two hundred and fifty years, it has received elaborate illustration from the pencil of the most poetical of sculptors. Mr. Armstead retains the designs for these carvings, and would certainly gratify a great number of his admirers if he could be persuaded to publish them. They display his powers of invention and of composition in their quintessence.

The sculptor then opened the large studios he now occupies at the back of Victoria Station, roofing over a carpenter's shop to add to his rough temple of art, and was soon busy with a number of important commissions. Comparatively little of his monumental and decorative sculpture has been exhibited in public galleries; its dimensions have usually been too considerable. But the visitor to the notable buildings of London may find Mr. Armstead's genius constantly accompanying him. At Westminster, the eighteen friezes in relief, carved in wood around the walls of the Queen's robing-room, represent the sculptor's conception of Arthurian myth, and mainly that branch of it which deals with the visions and the prowess of Sir Galahad. It is to be remarked that, in an age extremely prone to repeat Tennyson's render-

OPHELIA. (WILLIAM CALDER MARSHALL.)

ing of these legends, Mr. Armstead has been actively unaffected by it, and gives a version of his own which has a singular charm of grotesque romance. The reredos of Westminster Abbey is an elaborate contribution by Mr. Armstead to this venerable museum of English sculpture; but we have no space here to dwell upon its marble figures. The elaborate ornamentation of the whole front and side of the Colonial Office in Whitehall belongs to this public class of Mr. Armstead's work, and may properly be described before we approach his masterpiece, although posterior to it in date. These sculptures form the most noticeable external decoration of public buildings in London, and include large reliefs of Europe, Asia, Africa, America, and Australasia, and two allegorical reliefs of Government and Education, while in the niches above these panels are placed statues of a great number of English statesmen. Among the latter, which unfortunately are lifted so high, in accordance with the scheme of ornamentation, that they cannot well be seen in detail, that of Earl Grey is particularly happy.

The work, however, by which Mr. Armstead is most widely known, and by which his name will most prominently be handed down to posterity, is his share of the Albert Memorial, on which he was occupied uninterruptedly for eight years. Of this great monument —a mosaic of many styles and varied talent— his portion is by far the most attractive, and gains in charm as time brings out the demer-

EAGLE-SLAYER. (JOHN BELL.)

its of some of its neighbors. Four large bronze statues on the eastern side of the memorial, representing Chemistry, Astronomy, Rhetoric, and Medicine, and the whole of the elaborate frieze filling the southern and eastern surfaces of the podium, were intrusted to him; and these eighty-four life-size figures testify from their station in Kensington Gardens to the vitality, versatility, and tireless originality of the great artist who carved them in Sicilian marble. It can hardly be contested that these friezes contain the finest, that is, the most fully sustained work dedicated to public uses by an English sculptor.

Since the unveiling of the Albert Memorial, Mr. Armstead has been employed, with the exception of the decoration of the Colonial Office, mainly on private work of an imaginative or monumental kind. In 1873, he exhibited the study for an exquisite public fountain, adorned with figures taken from Milton's "Comus." We believe that we outrage no confidence, and divulge a very open secret, when we say that the Government expressed itself willing to commission the sculptor to execute this fountain in marble for a London site, if he would exchange for the pensive nymph of twilight, which now surmounts it, a figure of "Rule Britannia," and that Mr. Armstead's patriotism broke down under so stringent a test. In 1877, the exhibition of the Royal Academy was adorned by a very delicate and characteristic work of Mr. Armstead's, which we have the pleasure of en-

graving here for the first time,—the medallion placed in Cookham Church to the memory of Frederick Walker. This great and unfortunate painter, in some respects the most original that England has produced since Turner, had died in June, 1875, in the thirty-fifth year of his age, having been prevented for some years, by the fatal disease against which he vainly struggled, from exercising his magnificent powers to their full extent. Mr. Armstead carved this monument entirely as a labor of love, and set it up, in the church where Walker was buried, solely as the personal tribute of a stranger to the marvelous genius of the dead, in the same mood that drew from Dryden those immortal lines of elegy, beginning

"Farewell, too little and too lately known!"

Those who knew personally the Marcellus of English painting pronounced the likeness to be singularly true, and yet Mr. Armstead had, I believe, spoken to Walker but once.

Among Mr. Armstead's latest works must be mentioned two octagonal marble panels in extremely low and broad relief, curiously Ninivite in character, executed for the Guards' Chapel. His diploma work for the Royal Academy, of which he was made an associate in 1875 and a full member in 1879, is a relief of Aphrodite, drawn by dolphins. In 1882, he completed a very finely finished and originally conceived statue of Ariel.

Our business here is mainly with the men who have responded to the spirit of revival. Of the many sculptors who still survive and continue in advanced age what we may call the conservative tradition, there are but two whose names demand attention, Mr. William Calder Marshall and Mr. John Bell.

Mr. Marshall is at present the Nestor of official English sculpture. With the exception of Mr. Herbert and Mr. Cope, he is the oldest member of the Royal Academy, and in sculpture he is the only one who retains the tradition of the age of Chantrey. He was born in Edinburgh in 1813, and began to work in art at a very early age. He was still only a boy when he came up to London, and got permission to walk in and out of Chantrey's studio and pick up any information he could without exactly becoming the pupil of the popular sculptor. He found the style of Chantrey dry, conventional, and prosaic, and as his own bias was all in favor of poetry and Greece, he made his bow to Chantrey as soon as he politely could. Mr. Marshall then turned to Baily, in whom he found a very different master. Flaxman had only been dead five or six years, and in the penetralia of Baily's studio the worship of Flaxman was cultivated with ardor and piety, if hardly according to knowledge. These were the curves—it was explained to novices—which Mr. Flaxman projected in bass-relief before the body of a floating female figure; these were the folds employed by Mr. Flaxman to indicate drapery passing rapidly through air. All such formulæ seem to us not less foreign to the healthy genius of that great artist than to the dictates of nature herself, but they seemed both fascinating and authoritative to the little school of whom Baily, not yet disenchanted by misfortune, was the high-priest, and it may be that Mr. Calder Marshall has never become entirely free from this bondage to tradition. He still thinks that sculpture only moves with safety when it walks closely and demurely in the traces of Greek art, and of Greek art not as by analogy we may judge it to have been, but as by existing relics we know it to be; and he looks with some horror and dismay on those signs of widening observation and realistic freedom of treatment which some of us are apt to look upon as the only possible salvation of modern sculpture. From his youth to the present time he has scarcely ever failed to exhibit every year at the Royal Academy, and he has usually been represented by three or four works. As his task lies almost entirely in imagination, or, as it is called, "ideal" work, and as the public responds very coldly to this sort of sculpture, it follows that, notwithstanding his success, Mr. Marshall's groups have very frequently proceeded no further than plaster. In his magnificent studios in Ebury street, he has arranged a very interesting selection of his work, covering a period of nearly half a century; but in spite of this, to the inquiry of a visitor after some statue admired in the forties or the fifties, Mr. Marshall will grimly reply, "Oh! it was broken up long ago, and buried in the garden." Of the statues of that early time, one of the most notable, and one which, so far from being broken up, has been exquisitely executed in marble, is an "Ophelia," life size, with a trailing garland of the blossoms of the brook depending from her hands.

Mr. John Bell is a sculptor whose work has been favorably before the public for just fifty years, and who yet has reached old age without reaping any of the honors of his profession. There are few living artists, however, who have shown more dignity of conception, or more pure feeling for design, than he. His groups are broadly sculpturesque, they give an impression of solidity and calm, they secure

ARTEMIS.

(HAMO THORNYCROFT.)

TEUCER.

(HAMO THORNYCROFT.)

largeness of plane instead of sacrificing all to ingenuity of detail. One of these days, probably, it will be recognized that Mr. Bell has been an artist whom England would have done well to hold in honor. He was born in Norfolk, in 1811; and as he exhibited in the Royal Academy as far back as 1832, he forms a living link with the art of the beginning of the present century. In the garden of the South Kensington Museum, and passed by every one who enters that interesting institution, stands at present the most successful of Mr. Bell's early works, his "Eagle Slayer," modeled and exhibited in 1837. In 1841, he made a great success with a marble statue, half nude, of a girl washing her feet, called "Dorothea," and illustrated by a charming passage from "Don Quixote." In the International Exhibition, he attracted attention by an "Eve," half-sized, the peculiarity of which was that it was cast in white wax. Mr. Bell has interested himself in art education of all kinds, is the author of several volumes of a theoretical nature, has not disdained to impress the designs of porcelain inkstands and carved wooden bread-platters, and, which is perhaps more important, he made the beautiful iron gates to Kensington Gardens in 1851. He has done a good deal of monumental work for the Government.

By far the most successful, however, of Mr. Bell's works is the group of "America," in the base of the Albert Memorial. In this place he competes with sculptors so accomplished as Foley and MacDowell without losing anything by comparison; indeed, in the judgment of the present writer, his group surpasses even the "Asia" of the first mentioned in all the great qualities necessary for monumental sculpture.

IV.

THE exhibition of the Royal Academy for 1881 was remarkable, and perhaps unique, for containing one statue that was as much discussed and admired as any of the pictures. When we consider how little sculpture has done in England to keep itself on a level with its versatile and flourishing sister art, it is not surprising that visitors to the Academy too often enter the sculpture galleries only to give their eyes a little repose after being so long dazzled with color. But, from the very opening day, it was obvious that Mr. Thornycroft's "Teucer," which stood in the place of honor in the middle of the lecture-room, was going to be an exception. There has rarely been such unanimity of applause as greeted this statue, and we may be inclined to turn upon the sculptors who declare that the critics overlook their work, with the answer that when they produce such work as this there is no inclination to do them an injustice. Whether the "Teucer" is or is not, as has rather rashly been asserted, "the best imaginative statue ever exhibited at the Royal Academy," can hardly be decided without careful consideration of what Bacon and Flaxman may have exhibited before the memory of living generations; but it is very easy to admit that recent times have shown us nothing in England fit to compare with it. The young sculptor has leaped to the foremost rank at once, and has done so much at the outset, that he will have to preserve a very strenuous attitude in face of his art to support a reputation so suddenly assumed.

But though Mr. Thornycroft's name was thus abruptly brought before the general public, his own profession has for some years past been aware of his promise. At an unusually early age he was elected an associate of the Royal Academy, and though his success has been very rapid, he has risen on a gradual plane, and not by a perilous leap. Mr. Hamo Thornycroft was born in 1850. He belongs to a Cheshire family, and from both parents inherits a tendency to sculpture. His mother, Mrs. Mary Thornycroft, is the daughter of John Francis, and herself for many years the most successful female sculptor in the profession. Mr. Hamo Thornycroft went through the schools of the Royal Academy with great success, working meanwhile as the pupil of his father. The competition for the gold medal of the Royal Academy has been very frequently the occasion which has first brought out in a marked degree the individuality of English sculptors. It was so in 1875, when the theme given was a "Warrior Bearing a Wounded Youth from the Field of Battle." Mr. Thornycroft won the prize by a composition of great power and beauty, which showed him for the first time as a master, and which must always remain one of his important works. In this group, which was exhibited in 1876, and which became, in bronze, one of the standing prizes of the Art Union of London, the warrior is represented as a Greek of about thirty years of age, in full battle armor, with a voluminous crested helmet; he is bearded, and carries tenderly, with an expression of great sympathy and distress, a beautiful lad of about eighteen, entirely nude, whose head and limbs droop in the exhaustion of extreme suffering. The theme could hardly have been treated with more dignity or with a finer sentiment; and several points in the composition, though not at all obtruded, are soon

HAMO THORNYCROFT IN HIS STUDIO. (FROM A DRAWING BY T. BLAKE WIRGMAN.)

detected, and show great study and a happy intuition. For instance, the somewhat rigid forms of the warrior, who stiffens himself in his heavy panoply to carry the tall youth, contrast very cunningly with the soft curves of the swooning, unclothed body that he holds in his hands.

The six years which have succeeded this first public success have been years of sustained effort and continuous ascent. Mr. Thornycroft went to Florence and Rome, and made himself personally acquainted with the great sculptors of the Italian Renaissance, following with close attention, as only a practiced and professional eye can follow, the method of those marvelous workmen. His own work has shown manifest good result from the combined study of the Elgin Marbles and of Michelangelo, the two schools of art in which he has most deeply graduated. In 1877, he did not exhibit at the Royal Academy; he was preparing the statue of heroic size with which he adorned the exhibition of 1878,—a "Lot's Wife" in marble, exquisitely finished, at least in the upper part, and showing great advance on his preceding work. The woman was represented in the act of being changed into a pillar of salt, the transformation having already taken place in the lower part of her body, where the long lines of the drapery had already taken columnar forms, but not in her head, which was violently turned over her shoulder, or in her massive arms, which hung beside her. The

CALLICLES. (GEORGE A. LAWSON.)

modeling of the throat and shoulder were specially admirable, rendered, perhaps, with a certain exaggeration of type, excusable and natural in a young sculptor conscious of his powers and just fresh from the study of the Tomb of the Medici, and due, perhaps, to a conscious revolt against the smooth prettiness of the conventional female statue. Where there may be discovered, perhaps, a failure in the conception of this statue, is in the insistence on the rather trivial fantasy of the figure's turning to an actual pillar of salt, which has made the lower half of the statue monotonous and barely intelligible.

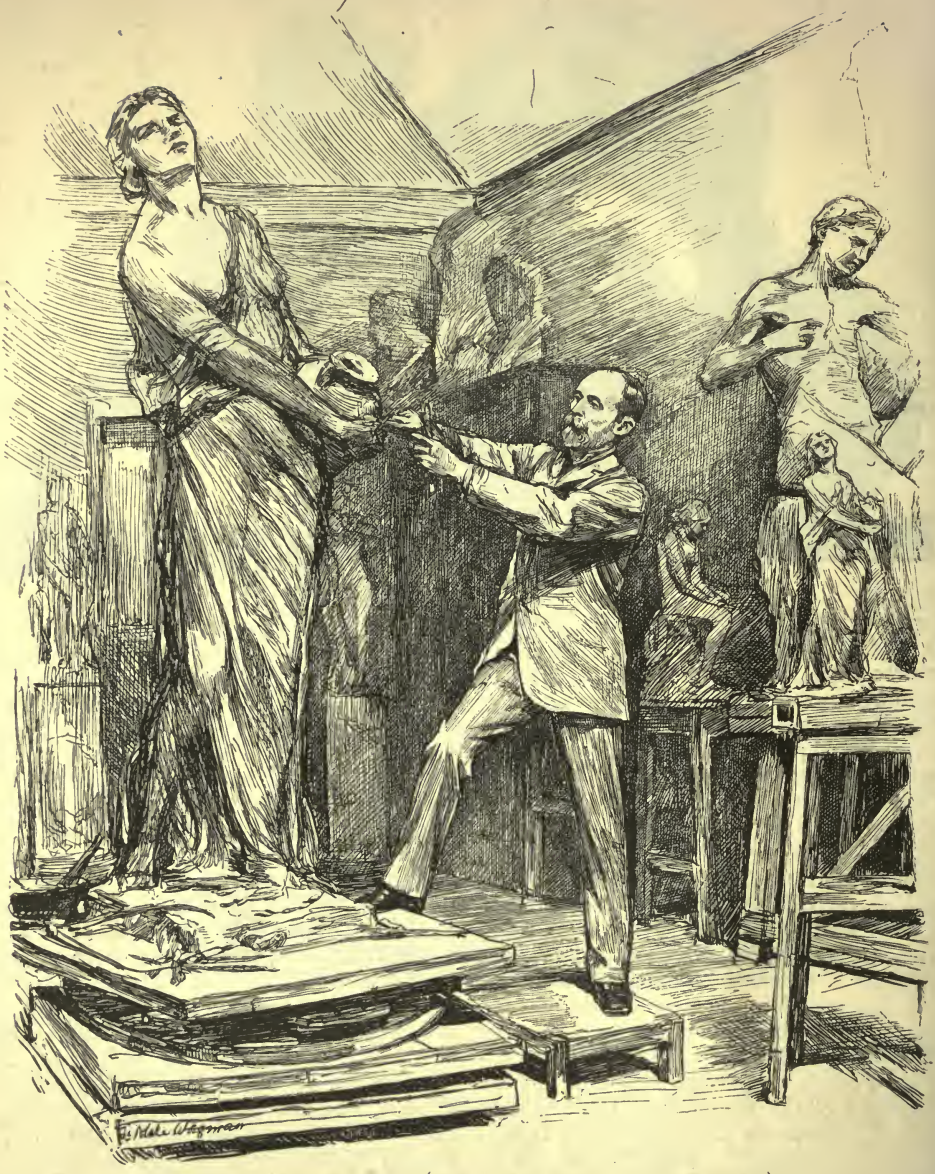
In 1880, Mr. Thornycroft made another great stride forward with his "Artemis," a statue of heroic size, which has since been placed in marble in Eaton Hall, the seat of the Duke of Westminster. We give an engraving of this figure seen from the front. The goddess advances through the forest and suddenly arrests her steps as she sees the quarry in front of her; with a dignified action she lays her hand over her right shoulder and takes an arrow from the quiver, which rests on her left. The other hand, with her bow in it, passes behind her back and is drawn against her right hip by her hound, which has strayed on the wrong side. This dog has been much admired, and a little anecdote concerning it, which has not been recorded, may be worth telling. The sculptor had arrived at the point when he wanted a hound as a model, and he could find none that suited him. On the very day when a dog was to have been finally fixed upon, there came to the studio door a very beautiful deer-hound, without any collar or mark of ownership, which seemed to have suffered much privation, and which absolutely refused

IN THE ARENA. (GEORGE A. LAWSON.)

to go away. The model was exactly what Mr. Thornycroft wanted, and while every effort was made to find the dog's master the charming creature sat for her portrait. Nobody claimed her, and she became the pet of the household; but the effects of her long exposure brought on a decline, and in spite of all the care that was taken of her, she died on the night of the day when the model was finished. A Greek would have said, with the utmost confidence, that the goddess had sent her, and when her work was done had taken her away again.

In January, 1881, Mr. Thornycroft was elected an associate of the Royal Academy, —an honor which has very seldom, if ever, fallen to the lot of so young a sculptor. His principal contribution to the ensuing exhibition showed, as we have already said, that he was worthy of the distinction. His statue of "Teucer" represents that warrior, the typical bowman of Homeric warfare, in the act of supporting the army of Greece, which otherwise mainly consisted of spearmen, against the ranks of Troy. Secure behind the shield of his brother Ajax, Teucer aimed constantly at Hector, but in vain. Homer could not, however, permit his mighty archer to be stigmatized as a bad shot, and he therefore states that each shaft was directed by the gods to another Trojan heart, since Hector was not to be slain. Mr. Thornycroft has given to the face of his archer an expression of intense malice and of eager expectation. He has aimed once more at Hector, and his fingers scarcely relax as he bends slightly forward, retaining the tense curve of his figure, while he watches the flight of the arrow. The whole statue is tingling with vitality; strength, passion, intelligence are all there in arrested action; and the warrior, unused to being thwarted in his purpose, can scarcely breathe until he sees that his vengeance is accomplished. Mr. Thornycroft's "Teucer," which is now in the public collection at South Kensington Museum, is a figure that has done more to restore the prestige of sculpture in England, and to give us hopes of a general revival of the art, than any which has been produced within the present generation.

Mr. George A. Lawson was born at Edinburgh in 1832, and his instinct for style, which is certainly very great, was starved and thwarted at first by the exhausted atmosphere of the age into which he was born. He received his earliest training from Alexander Ritchie, a Scotch sculptor of some repute in his own day, and after passing through the schools of the Royal Scottish Academy, he proceeded to Rome, where he mingled, but without any overweening sense of devotion, among the worshipers of Gibson. During his early life, Mr. Lawson made what he now considers the mistake of living in Liverpool, thus dividing himself from the larger art life of the metropolis, whither he finally came in 1867, to find himself, at the age of thirty-four, still completely unknown in London. He had, however, already attained a considerable reputation in the north by imaginative groups and figures in terra-cotta, in which he had thus early begun to display that intellectual effort and disapproval of the commonplace which may be said to be the principal char-



GEORGE A. LAWSON AT WORK. (FROM A DRAWING BY T. BLAKE WIRGMAN.)

acteristic of his works. These terra-cottas, however, had nothing else in common with the severe sculpture by which Mr. Lawson has made himself famous within the last few years. They were essentially romantic and picturesque—thoroughly Scotch, it may be said—in their appeal to a straightforward lyrical emotion or to a broad vein of humor. The year 1868 saw, at the Royal Academy, a work which enjoyed a very wide popularity and first made the artist's name generally accepted. This was his statuette of "Dominie Sampson." Everybody remembers the scene in "Guy Mannering," when the box of books arrives from London, and the dear old pedant is beside himself with excitement at the prospect of so much fine, confused reading. Mr. Lawson has represented him on his knees before the books, with a quarto open on one side and a folio on the other, vainly striving, in his exaltation of spirit, to read in all the volumes at once. In this delightful work humor runs riot,—it is impossible to contemplate the figure without laughing,—yet nothing is unduly exaggerated, and what is most important, the canons of sculpturesque effect are nowhere sacrificed, as, in the comic emanations of modern Italian sculpture, we find them

everywhere sacrificed to mere emphasis and eccentricity. "Dominie Sampson" is one of the most successful works in genre sculpture that has been produced in our time.

In Mr. Lawson's recent manner he has abandoned his early romantic and picturesque style in favor of what is more Greek, and yet, at the same time, more modern. Since that time Mr. Lawson has produced many charming and poetical studies of adolescence. We engrave the "Callicles" of 1879, one of these, a figure of a boy of thirteen or fourteen, in which Mr. Lawson has paid a masterly tribute to the genius of Mr. Matthew Arnold. The young slave of Empedocles has followed his master's mules up the ravine of Etna; and now he sits by the torrent side, under the pines, and having his laurel round his head, and his harp at his side, he tries that rare touch on the strings that the great man loves, and which soon arrests him, for a moment, as he hangs over the edge of the crater. We all know what words he is singing, and can hear on the lips of Mr. Lawson's boyish figure the faultless cadences beginning:

> "When from yon Parnassus' side,
> Young Apollo, all the pride
> Of the Phrygian flutes to tame,
> From the Phrygian highlands came."

In 1880, Mr. Lawson exhibited yet another study of adolescence, a boy a little older than "Callicles," and this, though not perhaps so interesting as others of his works, seems to me to be the most carefully and learnedly modeled of them all. This was "Daphnis," and represented the beautiful young shepherd of Mitylene as he stood when Chloe saw him first, in the shadow of the chestnut-trees, lost in a reverie before plunging into the fountain of the Nymphs. Mr. Lawson's most ambitious works have been "In the Arena," 1878, and "Cleopatra," 1881. The first of these, of which we give an engraving, represents a fight between an athlete and a panther. The "Cleopatra," a dignified draped figure in middle life, of massive forms, shows the "serpent of old Nile" at her last extremity; her head falls back on her throne, the asp is on her bosom, and in another moment her features will be contracted in death. Mr. Lawson exhibited last year a large figure of one of the Danaides, listlessly carrying her urn to the fountain, full of weariness and dejection, dragging along her miserable footsteps in despair. The general composition of this figure is indicated in the portrait we give of Mr. Lawson, who was working at it in the clay when he stood to Mr. Wirgman for his drawing.

If we may say that vivacity and delicacy of sentiment form the ruling characteristics of Mr. Lawson's style, in that of Mr. MacLean we are no less struck by the eminent technical skill and sound professional training. Mr. MacLean is the only English sculptor of consequence who has gone through the French schools, and enjoyed the privilege of art education in the one nation where sculpture is thoroughly alive. Thomas Nelson MacLean was born at Deptford, in Kent, in 1845, and spent his early years, until he was ten or eleven, at Birmingham, where his father was foreman to a firm of pin manufacturers. His father, though without knowledge of or care for art, recognized the boy's talent, and consented to send him to Paris, where he entered the studio of the famous sculptor-goldsmith, Carrier-Belleuse, as his *élève*. The *élève* of a Parisian sculptor is not exactly an apprentice or a pupil. He pays no premium, and he receives no wages. In exchange for lessons and advice received from the master, he has to clean up the studio, wait on the master, and assist the man he employs to execute his works by mixing clay or plaster for them. In Paris, Mr. MacLean enjoyed the companionship of some of the greatest artists of the day, such as Falguière and Dubois, and worked side by side with men who were then unknown, but who now stand in the foremost rank,—the sculptor Mercié, the painter Bastien-Lepage, the etcher Rajon. While thus working as a French sculptor, he did not entirely forget his fatherland, and in 1870 sent to the Royal Academy a statue of "Clio" and a terra-cotta group of a Greek mother teaching her son to read, called "La Reprimande." The accomplished style of these works at once attracted attention, but the war broke out, and any benefit which the artist might have enjoyed was entirely lost. During the siege of Paris, the sculptor was not merely almost starved, but was within an inch of being shot as a spy. On the 15th of November, 1870, he finally slipped through the French and Prussian lines, and contrived to reach London. But he was totally unknown, confounded in the general flight from Paris which glutted the art market, and before he received any employment he had very nearly suffered starvation a second time. At last, after four months of severe privation, he was able to make his way. In 1875, Mr. MacLean produced a certain sensation by his exhibition at the Royal Academy of three important and original works,—a group in marble of "The Finding of Moses"; "La Fleur des Champs," a charming marble statue; and "Ione," a female figure seated, which has been hitherto the most popular of all this sculptor's works. The "Sea-Nymph," a beautiful statuette in

SEA-NYMPH. (THOMAS NELSON MACLEAN.)

terra-cotta, of which we give an engraving, was exhibited at the Grosvenor Gallery in 1879, and a graceful statue destined for the decoration of a fountain, and called "La Source," in 1880.

Mr. MacLean has undergone many vicissitudes in the course of his career, and has pursued his art under unusual privations and disturbances. His severe French training has left him a little cold and mannered in the midst of his fine modern grace, a little reserved in invention, a little afraid of what is bright and novel, but equipped with a science and a technical experience which should insure him brilliant success in the future.

One of the healthiest signs of the revival of sculpture in England is the general spread of executive skill among the youngest generation of sculptors. It would be premature to assert a supreme position for any one of three or four rising men whose names are beginning to be familiar to artists, and who only need to model a "Teucer" or an "Ione" to become familiar to the public. Among those who

stand thus at the very threshold of distinction, Mr. E. Roscoe Mullins and Mr. Percival Ball have yet to do full justice to their remarkable powers. Mr. T. Stirling Lee, whose "Cain" was one of the best statues of 1881, has apparently enjoyed still sounder training, and should appropriate to himself the highest honors. But of all these inheritors of renown, I confess that to myself none has seemed more full of promise, more interpenetrated with the instinct for plastic beauty, than Mr. Alfred Gilbert, of whom I know nothing save that last year he sent from Rome a "Perseus" and a "Kiss of Victory," which were worthy of the highest praise. In the death of a young student named Wade, whose work was seen this winter at the Royal Academy schools, it is probable that we have lost a very considerable sculptor.

We have but traversed half the field of living English sculpture. We have touched the poetry of the art; we may return another day to its prose. An article, at least, would be required to do justice to the most popular sculptor of our day, Mr. Boehm, R. A.; to the school of Foley, with Mr. Thomas Brock, A. R. A., at its head; to the picturesque religious terra-cottas of Mr. Tinworth; and to the monumental art of such rising sculptors as Mr. Onslow Ford and Miss Henrietta Montalba. Names crowd up before us, but we must refrain from further testimony to the wide revival of English sculpture.

Edmund W. Gosse.

AT TEAGUE POTEET'S.

A SKETCH OF THE HOG MOUNTAIN RANGE.

BY JOEL CHANDLER HARRIS,

Author of "Uncle Remus, His Songs and Sayings," etc.

IN TWO PARTS: PART II.

WOODWARD was aroused during the night by the loud barking of dogs, the tramp of horses, and the confused murmur of suppressed conversation. Looking from the window, he judged by the position of the stars that it was three or four o'clock in the morning. He sat upon the side of the bed and sought, by listening intently, to penetrate the mystery of this untimely commotion. He thought he recognized the voice of Tip Watson, and he was sure he heard Sid Parmalee's peculiar cough and chuckle. The conversation soon lifted itself out of the apparent confusion, and became comparatively distinct. The voices were those of Teague and Sis.

"Come, now, pap, you must promise."

"Why, Sis, how *kin* I?"

"You shall, you shall, you *shall!*"

"Why, Sis, hon, he mought be a spy. Sid Parmalee he 'lows that the whole dad-blamed business is a put-up job. He wants to bet right now that we'll all be in jail in Atlanty 'fore the moon changes. I lay they don't none of 'em fool Sid."

"You don't love me any more," said Sis, taking a new tack.

"Good Lord, Sis! Why, honey, what put that idee in your head?"

"I know you don't—I know it! It's always Dave Hightower this, and Sid Parmalee that, and old drunken Jake Norris the other. I just *know* you don't love me."

Teague also took a new tack, but there was a quiver in his voice born of deadly earnestness.

"I tell you, Sis, they er houndin' airter us; they er runnin' us down; they er closin' in on us; they er hemmin' us up. Airter they git your pore ole pappy an' slam 'im in jail, an' chain 'im down, who's a-gwineter promise to take keer er *him?* Haint ole man Joshway Blasingame bin sent away off to Al*benny?* Haint ole man Cajy Shannon a-sarvin' out his time, humpback an' cripple ez he is? Who took keer *them?* Who ast anybody to let up on 'em? But don't you fret, honey; ef they haint no trap sot, nobody aint a-gwineter pester *him.*"

"I wouldn't trust that Sid Parmalee out of my sight!" exclaimed Sis, beginning to cry. "I know him, and I know all of you."

"But ef they is a trap sot," continued Teague, ignoring Sis's tears, "*ef* they is, I tell you, honey, a thousan' folks like me can't hol' the boys down. The time's done come when they er tetotally wore out with thish 'ere sneakin' aroun' an' hidin'-out bizness."

This appeared to end the conversation, but it left Woodward considerably puzzled.

Shortly afterward he heard a rap at his door, and before he could respond to the summons by inquiry or invitation, Teague Poteet entered with a lighted candle in his hand.

"I 'lowed the stirrin' 'roun' mought 'a' sorter rousted you," said Teague, by way of apology, as he placed the light on a small table and seated himself on a wooden chest.

"Yes. What's up?" Woodward inquired.

"Oh, the boys—thes the boys," Teague replied, chuckling and rubbing his chin with an embarrassed air; "hit's thes the boys cuttin' up some er ther capers. They er mighty quare, the boys is," he continued, his embarrassment evidently increasing, "mighty quare. They uv up'd an' tuk a notion for to go on a little frolic, an' they uv come by airter me, an' nothin' wont do 'em but I mus' fetch you. S' I, 'Genter*men*, they haint no manners in astin' a man on a marchin' frolic this time er night,' s' I; but Sid Parmalee, he chipped in an' 'lowed that you wuz ez high up for fun ez the next man."

Woodward thought he understood the drift of things, but he was desperately uncertain. He reflected a moment, and then faced the situation squarely.

"If you were in my place, Mr. Poteet, what would you do?" he asked.

This seemed to relieve Teague. His embarrassment disappeared. His eyes, which had been wandering uneasily around the room, sought Woodward's face and rested there. He took off his wide-brimmed wool hat, placed it carefully upon the floor, and ran his fingers through his iron-gray hair.

"I don't mind sayin'," he remarked, grimly, "that I uv seed the time when I'd uv ast you to drap out'n that winder an' make for the bushes, knowin' that you'd tote a han'ful er bullets in thar wi' you. But on account er me an' Sis, I'm willin' to extracise my bes' judg*ment*. It mayn't be satisfactual, but me and Sis is mighty long-headed when we pulls tergether. Ef I was you, I'd thes slip on my duds, an' I'd go out thar whar the boys is, an' I'd be high up for the'r frolic, an' I'd jine in wi' 'em, an' I'd raise any chune they give out."

With this Poteet gravely bowed himself out, and in a very few minutes Woodward was dressed and ready for adventure. He was young and bold, but he felt strangely ill at ease. He realized that, with all his address, he had never been able to gain the confidence of these mountaineers, and he felt sure they connected him with the revenue raid that was about to be made, and of which they had received information. He appreciated to the fullest extent the fact that the situation called for the display of all the courage and coolness and nerve he could command; but, in the midst of it all, he longed for an opportunity to show Sis Poteet the difference between a real man and a feeble-minded, jocular rascal like Tip Watson.

His spirits rose as he stepped from the low piazza into the darkness and made his way to where he heard the rattle of stirrups and spurs. Some one hailed him:

"Hello, Cap!"

"Ah-yi!" he responded. "It's here we go, gals, to the wedding."

"I knowed we could count on 'im," said the voice of Tip Watson.

"Yes," said Sid Parmalee, "I knowed it so well that I fotch a extry hoss."

"Where are we going?" Woodward asked.

"Well," said Parmalee, "the boys laid off for to have some fun, an' it's done got so these times that when a feller wants fun he's got to git furder up the mounting."

If the words were evasive, the tone was far more so, but Woodward paid little attention to either. He had the air of a man accustomed to being called up in the early hours of the morning to go forth on mysterious expeditions.

A bright fire was blazing in Poteet's kitchen, and the light, streaming through the wide door-way, illuminated the tops of the trees on the edge of the clearing. Upon this background the shadows of the women, black and vast,—Titanic indeed,—were projected as they passed to and fro. From within there came a sound as of the escape of steam from some huge engine; but the men waiting on the outside knew that the frying-pan was doing its perfect work.

The meat sizzled and fried; the shadows in the tops of the trees kept up what seemed to be a perpetual promenade, and the men outside waited patiently and silently. This silence oppressed Woodward. He knew that but for his presence the mountaineers would be consulting together and cracking their dry jokes. In spite of the fact that he recognized in the curious impassiveness of these people the fundamental qualities of courage and endurance, he resented it as a barrier which he had never been able to break down. He would have preferred violence of some sort. He could meet rage with rage, and give blow for blow, but how was he to deal with the reserve by which he was surrounded? He was not physically helpless, by any means, but the fact that he had no remedy against the attitude of the men of Hog Mountain chafed him almost beyond endurance. He was emphatically a man of action—full of the enterprises usually set in motion by a bright mind, a quick temper, and ready cour-

age; but, measured by the impassiveness which these men had apparently borrowed from the vast, aggressive silences that give strength and grandeur to their mountains, how trivial, how contemptible all his activities seemed to be!

But the frying was over after awhile. The Titanic shadows went to roost in the tops of the trees, and Teague Poteet and his friends, including Ex-Deputy Woodward, took themselves and their fried meat off up the mountain, and the raid followed shortly after. It was a carefully planned raid, and deserved to be called a formidable one. Like many another similar enterprise it was a failure, so far as the purposes of the Government were concerned, but fate or circumstance made it famous in the political annals of that period. Fifteen men, armed with carbines, rode up the mountain. They were full of the spirit of adventure. They felt the strong arm of the law behind them. They knew they were depended upon to make some sort of demonstration, and this, together with a dram too much here and there, made them a trifle reckless and noisy. They had been taught to believe that they were in search of outlaws. They caught from the officers who organized them something of the irritation which was the natural result of so many fruitless attempts to bring Hog Mountain to terms. They betrayed a sad lack of discretion. They brandished their weapons in the frightened faces of women and children, and made many foolish mistakes which need not be detailed here.

They rode noisily over the mountain, making a circle of Pulliam's Summit, and found nothing. They peered over the precipitous verge of Prather's Mill Road, and saw nothing. They paused occasionally to listen, and heard nothing. They pounced upon a lonely peddler who was toiling across the mountain with his pack upon his back, and plied him with questions concerning the Moonshiners. This peddler appeared to be a very ignorant fellow indeed. He knew his name was Jake Cohen, and that was about all. He had never crossed Hog Mountain before, and, so help his gracious, he would never cross it again. The roads were all rough and the ladies were all queer. As for the latter—well, great Jingo! they would scarcely look at his most beautiful collection of shawls and ribbons and laces, let alone buy them. In Villa Ray (or, as Cohen called it, "Feel Hooray"), he had heard that Teague Poteet had been arrested and carried to Atlanta by a man named Woodward. No one had told him this, but he heard people talking about it wherever he went in Villa Ray, and there seemed to be a good deal of excitement in the settlement.

Cohen was a droll customer, the revenue officers thought, and the longer they chatted with him the droller he became. First and last they drew from him what they considered to be some very important information. But most important of all was the report of the arrest of Teague Poteet. The deputies congratulated themselves. They understood the situation thoroughly, and their course was perfectly plain. Poteet, in endeavoring to escape from them, had fallen into the clutches of Woodward, and their best plan was to overtake the latter before he reached Atlanta with his prize, and thus share in the honor of the capture. With this purpose in view they took a dram all round and turned their horses' heads down the mountain.

Cohen certainly was a droll fellow. He stood in the road until the revenue men had disappeared. Then he unbuckled the straps of his pack, dropped it upon the ground, and sat down upon a bowlder. With his head between his hands, he appeared to be lost in thought, but he was only listening. He remained listening until after the sounds of the horses' feet had died away.

Then he carried his precious pack a little distance from the roadside, covered it with leaves, listened a moment to be sure that the deputies were not returning, and then proceeded to a little ravine in the side of the mountain where the Moonshiners lay. He had been waiting nearly two days where the revenue men found him, and his story of the capture of Teague Poteet was concocted for the purpose of sending the posse back down the mountain the way they came. If they had gone on a mile farther they would have discovered signs of the Moonshiners, and this discovery would have led to a bloody encounter, if not to the capture of the leaders.

The deputies rode down the mountain in the best of spirits. They had accomplished more than any other posse; they had frightened the Moonshiners of Hog Mountain to their hiding-places, and not a deputy had been killed or even wounded. The clatter they made as they journeyed along attracted the attention of Ab Bonner, a boy about fifteen, who happened to be squirrel-hunting, and he stepped into the road to get a good view of them. He was well-grown for his age, and his single-barreled shotgun looked like a rifle. The revenue men halted at once. They suspected an ambuscade. Experience had taught them that the Moonshiners would fight when the necessity arose, and they held a council of war. The great gawky boy, with the curiosity of youth and ignorance combined, stood in the road and watched them. When they proceeded toward him in a compact body, he

passed on across the road. Hearing a command to halt, he broke into a run, and endeavored to make his way across a small clearing that bordered the road. Several of the deputies fired their guns in the air, but one, more reckless than the rest, aimed directly at the fugitive, and Ab Bonner fell, shot through and through.

Viewed in its relations to all the unfortunate events that have marked the efforts of the Government officials to deal with the violators of the revenue laws from a political point of view, the shooting of this ignorant boy was insignificant enough. But it was important to Hog Mountain. For a moment the deputy-marshals were stunned and horrified at the result of their thoughtlessness. Then they dismounted and bore the boy to the roadside again and placed him under the shade of a tree. His blood shone upon the leaves, and his sallow, shrunken face told a pitiful tale of terror, pain, and death.

The deputy-marshals mounted their horses and rode steadily and swiftly down the mountain, and by nightfall they were far away. But there was no need of any special haste. The winds that stirred the trees could carry no messages. The crows flying over, though they made a great outcry, could tell no tales. Once the boy raised his hand and cried "Mammy!" but there was no one to hear him. And though ten thousand ears should listen, the keenest could hear him no more. He became a part of the silence—the awful, mysterious silence— that sits upon the hills and shrouds the mountains.

This incident in the tumultuous experience of Hog Mountain—the killing of Ab Bonner was merely an incident—had a decisive effect upon the movements of Ex-Deputy Woodward. When Jake Cohen succeeded in turning the revenue officials back, the mountaineers made themselves easy for the day and night, and next morning prepared to go to their homes. Some of them lived on one side of Hog Mountain, and some on the other. They called themselves neighbors, and yet they lived miles apart, and it so happened that, with few exceptions, each went in a different direction. Teague Poteet gave the signal:

"Come, Cap," he said to Woodward, "yess be a-traipsin'. Puss'll be a-puttin' on biskits for supper before we git thar if we don't push on. Be good to yourse'f, boys, an' don't raise no fracas."

Poteet and Woodward rode off together. That afternoon, half a mile from Poteet's, they met a woman running in the road, crying and wringing her hands wildly. She moved like one distracted. She rushed past them, crying:

"They uv killed little Ab! They uv killed him. Oh, Lordy! they uv killed little Ab!"

She ran up the road a little distance and then came running back; she had evidently recognized Poteet. As she paused in the road near them, her faded calico sun-bonnet hanging upon her shoulders, her gray hair falling about her face, her wrinkled arms, writhing in response to a grief too terrible to contemplate, she seemed related in some vague way to the prophets of old who were assailed by fierce sorrows. Here was something more real and more awful than death itself. Woodward felt in his soul that the figure, the attitude, the misery of this poor old woman were all biblical.

"Oh, Teague," she cried, "they uv killed him! They uv done killed my little Ab! Oh, Lordy! that mortal haint a-livin' that he ever done any harm. What did they kill him for?" Then she turned to Woodward: "Oh, Mister, Mister! *please* tell me what he done. *I'm* the one that made the liquor, *I'm* the one. Oh, Lordy! what did they kill little Ab for?"

Teague Poteet dismounted from his horse, took the woman firmly but gently by the arm and made her sit down by the side of the road. Then, when she was more composed, she told the story of finding her son's body. It was a terrible story to hear from the lips of the mother, but she grew quieter after telling it, and presently went on her way. The two men watched her out of sight.

"I'll tell you what, Cap," said Teague, as he flung himself into the saddle, "they er houndin' airter us. They er 'buzin' the wimmin an' killin' the childern; stidder carryin' out the law, they er gwine about a-shootin' an' a-murderin'. *So fur, so good.* Well, now, lemme tell you: the hawk's done lit once too much in the chicken-lot. This is a free country. I haint a-layin' no blame on you. Me an' Sis stood by you when the boys s'ore they wuz a-gwine to rattle you up. We made 'em behave the'rse'ves, an' I haint a-blamin' you, but they er houndin' airter us, an' ef I wuz you, I wouldn't stay on this hill nary 'nuther minit longer than it 'ud take me to git off'n it. When the boys git wind er this ongodly bizness, they ull be mighty hard to hol'. I reckon maybe you'll be a-gwine down about Atlanty. Well, you thes watch an' see what stan' the Govern*ment's* gwineter take 'bout Ab Bonner, an' ef hit don't take no stan', you thes drap in thar an' tell 'em how you seed er ole man name Teague Poteet, an' *he* 'lowed that the revenue fellers better not git too clost ter Hog Mountain, bekaze the hidin'-out bizness is done played. The law what's good enough fer pore little Ab

Bonner is good enough fer the men what shot 'im."

They rode on until they came to Poteet's house.

"We'll thes go in an' git a snack," said Teague, "an' airter that your best gait is a gallop."

But Woodward declined. He was dazed as well as humiliated, and he had no desire to face Sis Poteet. He pictured to himself the scorn and bitterness with which she would connect his presence on the Mountain with the murder of Ab Bonner, and he concluded to ride on to Gullettsville. He took Teague Poteet by the hand.

"Good-bye, old man," he said; "I shall remember you. Tell Miss Sis—well, tell Miss Sis good-bye." With that he wheeled his horse and rode rapidly toward Gullettsville.

It was a fortunate ride for him, perhaps. The wrath of Hog Mountain was mightily stirred when it heard of the killing of Ab Bonner, and Woodward would have fared badly at its hands. The wrath of others was stirred also. The unfortunate affair took the shape of a political issue, and thus the hands of justice were tied. But all this is a matter of history and need not be dwelt upon.

In the meantime, as the days passed, Teague Poteet became dimly and uncomfortably conscious that a great change had come over Sis. One day she would be as bright and as gay as the birds in the trees; the next, she would be quiet, taciturn, and apparently depressed. As Teague expressed, "One minnit hits Sis, an' the nex' hit's some un else." Gradually the fits of depression grew more and more frequent and lasted longer. She was abstracted and thoughtful, and her petulance disappeared altogether. The contrast resulting from this change was so marked that it would have attracted the attention of a person of far less intelligence than Teague Poteet. He endeavored to discuss the matter with his wife, but Puss Poteet was not the woman to commit herself. She was a Mountain Sphinx.

"I'm afeard Sis is ailin'," said Teague, upon one occasion.

"Well," replied Puss, "she aint complainin'."

"That's hit," Teague persisted; "she haint complainin'. That's what pesters me. She looks lonesome, an' she's got one er them kinder fur-away looks in her eyes that gives me the all-overs." The Sphinx rubbed its snuff and swung in its rocking-chair. "Some days she looks holp up, an' then ag'in she looks cas' down. I 'low'd maybe you mought know what ailed her."

"Men folks," said Puss, manipulating her snuff-swab slowly and deliberately, "wont never have no sense while the worl' stan's. Ef a 'oman aint gwine hether an' yan', rippity-clippity, day in an' day out, an' half the night, they er on the'r heads. Wimmen haint men."

"That's so," replied Teague, gravely, "they haint. Ef they wuz, the men 'ud be in a mighty nice fix."

"They'd have some sense," said Puss.

"Likely so. Yit 'oman er man kin shet one eye an' tell that Sis looks droopy, an' when Sis looks droopy I know in reason sump'n' nuther ails her."

"Well, goodness knows, I wish in my soul somebody 'd shet one eye an' look at me," exclaimed Puss, with a touch of jealousy in her tone. "I traipse 'roun' this hill ontell I'm that wore out I kin skacely drag one foot airter t'other, an' I don't never hear nobody up an' ast what ails *me*. It's Sis, Sis, Sis, all the time, an' eternally. Ef the calf's fat, the ole cow aint got much choice betwixt the quogmire an' the tan-vat."

"Lord, how you do run on," said the iron-gray giant, rubbing his knuckles together sheepishly. "You don't know Sis ef you go on that away. Many's the time that chile 'ud foller me up an' say, 'Pap, ef you see my shawl a-hangin' out on the fence, Puss'll be asleep, an' don't you come a-lumberin' in an' wake her up, nuther.' An' many's the time she'd come out an' meet me, an' up an' say, 'Pap, Puss has takin' an' bin a-mopin' all day long; yess you an' me go in an' fetch her up.' An' bless your life," Teague continued, addressing some imaginary person on the other side of the fire-place, "when me an' Sis sets our heads for to fetch anybody up, they er thes natchully erbleeged ter come."

Puss rubbed her snuff and swayed to and fro in her rocking-chair, disdaining to make any reply to this array of facts and arguments; and Teague was as ignorant as ever of the cause of the queer change in his daughter. Perhaps, as becomes a dutiful husband, he should have retorted upon his complaining wife with complaints of his own; but his interests and his isolation had made him thoughtful and forbearing. He had the trait of gentleness which frequently sweetens and equalizes large natures. He remembered that behind whatever complaints—reasonable or unreasonable—Puss might make, there existed a stronghold of affection and tenderness; he remembered that her whole life had been made up of a series of small sacrifices; he knew that she was ready, whenever occasion made it necessary, to cast aside her snuff-swab and her complaints, and go to the rack without a murmur.

But Teague was by no means satisfied with the condition of affairs, so far as Sis was con-

cerned. He said no more to his wife, but he kept his eyes open. The situation was baffling to the point of irritation, but Teague betrayed neither uneasiness nor restlessness. He hung about the house more, and he would frequently walk in quietly when the women thought he was miles away.

There were times when Sis ignored his presence altogether, but as a general thing she appeared to relish his companionship. Sometimes at night, after her mother had gone to bed, she would bring her chair close to Teague's, and rest her head upon his shoulder, while he smoked his pipe and gazed in the fire. Teague enjoyed these occasions to the utmost, and humored his daughter's slightest wish, responding to her every mood and fancy. If she talked, he talked; if she was silent, he said nothing. Once she dropped asleep with her head on his arm, and Teague sat holding her thus half the night. When she did awake she upbraided herself so earnestly for imposing on her old pappy (as she called him) that Teague yawned, and stretched himself, and rubbed his eyes, and pretended that he, too, had been asleep.

"Lordy, honey! I wuz that gone tell I didn't know whe'er I 'uz rolled up in a haystack er stretched out in a feather-bed. I reckon ef you'd 'a' listened right clos't you'd 'a' heern me sno'. I thes laid back an' howled at the rafters, an' once-t er twice-t I wuz afeard I mout waken up Puss."

Sis's response to this transparent fib was an infectious peal of laughter, and a kiss which amply repaid Teague for any discomfort to which he may have been subjected.

Once, after Sis had nestled up against Teague, she asked somewhat irrelevantly:

"Pap, do you reckon Mr. Woodward was a revenue spy after all?"

"Well, not to'rds the last. He drapped that business airter he once seed its whichaways. What makes you ast?"

"Because I hate and despise revenue spies."

"Well, they haint been a-botherin' roun' lately, an' we haint got no call to hate 'em tell they gits in sight. Hatin' is a mighty ha'sh disease. When Puss's preacher comes along, he talks ag'in it over the Bible, an' when you call 'im in to dinner, he talks ag'in it over the chicken-bones. I reckon hit's mighty bad—mighty bad."

"Did you like him?"

"Who? Puss's preacher?"

"Now, you know I don't mean *him*, pap."

"*Oh!* Cap'n Woodward. Well, I tell you what, he had mighty takin' ways. Look in his eye, an' you wouldn't see no muddy water; an' he had grit. They haint no two ways about that. When I ast 'im out with us that night, he went like a man that had a stool to a quiltin'-bee; an' when Duke Dawson an' Sid Parmalee flung out some er the'r slurs, he thes snapt his fingers in the'r face, an' ups an' says, says he, 'Gents, ef youer up for a frolic, I'm your man, an' ef youer in for a fight, thes count me in,' says he. The boys wuz a little drinky," said Teague, apologetically.

Sis squeezed up a little closer against her father's shoulder.

"Did they fight, pap?"

"Lord bless you, no. I thes taken an' flung my han' in Duke's collar an' fetched 'im a shake er two, an' put 'im in a good humor thereckly; an' then airterwerds Tip Watson sot 'em all right when he read out the letter you foun' on the floor."

"Oh, pap!" Sis exclaimed in a horrified tone, "I *slapped* that letter out of Mr. Woodward's *hand!*"

Teague laughed exultantly.

"What'd he say?"

"He didn't say *anything*. He looked like he expected the floor to open and swallow him. I never was so ashamed in my life. I've cried about it a thousand times."

"Why, honey, I wouldn't take an' *cry* 'bout it ef I wuz you."

"Yes, you would, pap, if—if—you were me. I don't know what came over me; I don't know how I could be so hateful. No *lady* would ever do such a thing as that."

Sis gave her opinion with great emphasis. Teague took his pipe out of his mouth.

"Well, I tell you what, honey, they mought er done wuss. I let you know, when folks is got to be a-runnin' here an' a-hidin' yander, hit's thes about time for the gals for to lose the'r manners. Nobody wouldn't a-blamed you much ef you'd a-fetched the Cap'n a clip stidder the letter; leastways, *I* wouldn't."

The girl shivered and caught her breath.

"If I had hit *him*," she exclaimed vehemently, "I should have gone off and killed myself."

"*Shoo!*" said Teague in a tone intended to be at once contemptuous and re-assuring, but it was neither the one nor the other.

This conversation gave Teague fresh cause for anxiety. From his point of view, Sis's newly-developed humility was absolutely alarming, and it added to his uneasiness. He recognized in her tone a certain shyness which seemed to appeal to him for protection, and he was profoundly stirred by it without at all understanding it. With a tact that might be traced to either instinct or accident, he refrained from questioning her as to her troubles. He was confused, but

watchful. He kept his own counsel, and had no more conferences with Puss. Perhaps Puss was also something of a mystery; if so, she was old enough to take care of her own affairs.

Teague had other talks with Sis,—some general, some half-confidential—and he finally became aware of the fact that every subject led to Woodward. He humored this, awkwardly but earnestly, and thought he had a clue, but it was a clue that pestered him more than ever.

He turned it round in his mind and brooded over it. Woodward was a man of fine appearance and winning manners, and Sis, with all the advantages—comparative advantages, merely—that the Gullettsville Academy had given her, was only a country girl after all. What if———? Teague turned away from the suspicion in terror. It was a horrible one; but as often as he put it aside, so often he returned to it. It haunted him. Turn where he might, go where he would, it pursued him night and day.

One mild afternoon in the early spring, Mr. Philip Woodward, ex-deputy marshal, leaned against the railing of Broad street bridge in the city of Atlanta, and looked northward to where Kennesaw Mountain rises like a huge blue billow out of the horizon and lends picturesqueness to the view. Mr. Woodward was in excellent humor. He had just made up his mind in regard to a matter that had given him no little trouble. A wandering prospector, the agent of a company of Boston capitalists, had told him a few hours before that he would be offered twenty thousand dollars for his land-lot on Hog Mountain. This was very important, but it was not of the highest importance. He nodded familiarly to Kennesaw, and thought: "I'll slip by you to-morrow and make another raid on Hog Mountain, and compel that high-tempered girl to tell me what she means by troubling me so."

A train of cars ran puffing and roaring under the bridge, and as Woodward turned to follow it with his eye he saw standing upon the other side a tall, gaunt, powerful-looking man, whom he instantly recognized as Teague Poteet. Teague wore the air of awkward, recklessly-helpless independence which so often deceives those who strike the mountain men for a trade. Swiftly crossing the bridge, Woodward seized Teague and greeted him with a cordiality that amounted to enthusiasm.

"Well, of all the world, old man, you are the one I most wanted to see." Teague's thoughts ran with grim directness to a reward that had been offered for a certain gray old Moonshiner who had made his head-quarters on Hog Mountain. "How are all at home?" Woodward went on, "and what is the news?"

"The folks is porely and puny," Teague replied, "an' the news wont skacely b'ar relatin'. I haint a-denyin'," he continued, rubbing his chin and looking keenly at the other, "I haint a-denyin' but what I'm a-huntin' airter you, an' the business I come on haint got much howdyin' in it. Ef you uv got some place er nuther wher' ever'body haint a cockin' up the'r years at us, I'd like to pass some words wi' you."

"Why, of course," exclaimed Woodward, hooking his arm in Teague's. "We'll go to my room. Come! And after we get through, if you don't say that my business with you is more important than your business with me, then I'll agree to carry you to Hog Mountain on my back. Now that's a fair and reasonable proposition. What do you say?"

Woodward spoke with unusual warmth, and there was a glow of boyish frankness in his tone and manners that Teague found it hard to resist.

"Well, they's thes this much about it," he said. "My business is mighty troublesome, an' yit, hit's got to be settled up."

He had put a revolver in his pocket on account of this troublesome business.

"So is mine troublesome," responded Woodward, laughing, and then growing serious. "It has nearly worried me to death."

Presently they reached Woodward's room, which was up a flight of stairs near the corner of Broad and Alabama streets. It was a very plain apartment, but comfortably furnished and kept with scrupulous neatness.

"Now, then," said Woodward, when Teague had seated himself, "I'll settle my business, and then you can settle yours." He had seated himself in a chair, but he got up, shook himself, and walked around the room nervously. The lithograph of a popular burlesque actress stared brazenly at him from the mantel-piece. He took this remarkable work of art, folded it across the middle, and threw it into the grate. "I've had more trouble than enough," he went on, "and if I hadn't met you to-day I intended to hunt you up to-morrow."

"In Atlanty?"

"No; on Hog Mountain. Oh, I know the risk," Woodward exclaimed, misinterpreting Teague's look of surprise. "I know all about that, but I was going just the same. Has Miss Sis ever married?" he asked, stopping before Teague and blushing like a girl.

"Not less'n it happened sence last We'n's-day, an' that haint noways likely," replied

the other, with more interest than he had yet shown. Woodward's embarrassment was more impressive than his words.

"I hardly know how to say it," he continued, "but what I wanted to ask you was this: Suppose I should go up to Hog Mountain some fine morning, and call on you and say, as the fellow did in the song, 'Old man, old man, give me your daughter,' and you should reply, 'Go upstairs and take her if you want to,' what do you suppose the daughter would say?"

Woodward tried in vain to give an air of banter to his words. Teague leaned forward with his hands upon his knees.

"Do you mean would Sis marry you?" he asked.

"That is just exactly what I mean," Woodward replied.

The old mountaineer rose and stretched himself, and drew a deep sigh of relief. His horrible suspicion had no foundation. He need not fly to the mountains with Woodward's blood upon his hands.

"Lemme tell you the honest truth, Cap," he said, placing his hand kindly on the young man's shoulder. "I might 'low she would, an' I might 'low she wouldn't; but I'm erbleege to tell you that I dunno nothin' 'bout that chil' no more'n ef I hadn't a-never seed 'er. Wimmin is mighty kuse."

"Yes," said Woodward, "they are curious."

"Some days they er gwine rippitin' aroun' like the woods wuz a-fire, an' then ag'in they er mopin' an' a-moonin' like ever' minnit wuz a-gwine to be the nex'. I bin a-studyin' Sis sence she wan't no bigger'n a skinned rabbit, an' yit I haint got to A, B, C, let alone *a-b* ab, *u-b* ub. When a man lays off for to keep up wi' the wimmin folks, he kin thes make up his min' that he'll have to git in a dark corner an' scratch his head many a time when he oughter be a-diggin' for his livin'. They'll addle 'im thereckly."

"Well," said Woodward, with an air of determination, "I'm going back with you and hear what Miss Sis has to say. Sit down. Didn't you say you wanted to see me on business?"

"I did start out wi' that idee," said Teague, slipping into a chair and smiling curiously, "but I disremember mostly what 'twuz about. Ever'thing is been a-pesterin' me lately, an' a man that's hard-headed an' long-legged picks up all sorts er foolish notions. I wish you'd take keer this pickle-bottle, Cap," he continued, drawing a revolver from his coat-tail pocket and placing it on the table. "I uv bin afeared ever sence I started out that the blamed thing 'ud go off an' t'ar my jacket wrong-sud-outerds. Gimme a gun, an' you'll gener'lly fin' me somewheres aroun'; but them ar clickety-cluckers is got mos' too many holes in 'em for to suit my eyesight."

Usually, it is a far cry from Atlanta to Hog Mountain, but Teague Poteet and Woodward lacked the disposition of loiterers. They shortened the distance considerably by striking through the country, the old mountaineer remarking that if the big road would take care of itself he would try and take care of himself.

They reached Poteet's one afternoon, creating a great stir among the dogs and geese that were sunning themselves outside the yard. Sis had evidently seen them coming, and was in a measure prepared; but she blushed painfully when Woodward took her hand, and she ran into her father's arms with a little hysterical sob.

"Sis didn't know a blessed word 'bout my gwine off to Atlanty," said Teague, awkwardly but gleefully. "Did you, honey?"

Sis looked from one to the other for an explanation. Woodward was smiling the broad, unembarrassed smile of the typical American lover, and Teague was laughing. Suddenly it occurred to her that her father, divining her secret—her sweet, her bitter, her well-guarded secret—had sought Woodward out and begged him to return. The thought filled her with such shame and indignation as only a woman can experience. She seized Teague by the arm:

"Pap, have you been to Atlanta?"

"Yes, honey, an' I made 'as'e to come back."

"Oh, how could you! How *dare* you do such a thing!" she exclaimed, passionately. "I will never forgive you as long as I live—never!"

"Why, honey——"

But she was gone, and neither Teague nor her mother could get a word of explanation from her. Teague coaxed, and wheedled, and threatened, and Puss cried and quarreled; but Sis was obdurate. She shut herself in her room and remained there. Woodward was thoroughly miserable. He felt that he was an interloper in some measure, and yet he was convinced that he was the victim of a combination of circumstances for which he was in nowise responsible. He had never made any special study of the female mind, because, like most young men of sanguine temperament, he was convinced that he thoroughly understood it; but he had not the remotest conception of the tragic element which, in spite of social training or the lack of it, controls and gives strength and potency to feminine emotions. Knowing nothing of this, Woodward knew nothing of women.

The next morning he was stirring early, but he saw nothing of Sis. He saw nothing of her during the morning, and at last, in the bitterness of his disappointment, he saddled his horse, and made preparations to go down the mountain.

"I reckon it haint no use to ast you to make out your visit," said Teague gloomily. "That's what I says to Puss. I'm a free nigger ef Sis don't beat my time. You'll be erbleege to stop in Gullettsville to-night, an' in case er accidents you thes better tie this on your coat."

The old mountaineer produced a small piece of red-woolen string and looped it in Woodward's button-hole.

"Ef any er the boys run up wi' you an' begin to git limber-jawed," Teague continued, "thes hang your thum' in that kinder keerless like, an' they'll sw'ar by you thereckly. Ef any of 'em asts the news, thes say they's a leak in Sugar Creek. Well, well, well!" he exclaimed, after a little pause; "hit's thes like I tell you. Wimmin folks is mighty kuse."

When Woodward bade Puss good-bye, she looked at him sympathetically and said:

"Sometime when youer passin' by, I'd be mighty thankful ef you 'ud fetch me some maccaboy snuff."

The young man, unhappy as he was, was almost ready to accuse Mrs. Poteet of humor, and he rode off with a sort of grim desire to laugh at himself and the rest of the world. The repose of the mountain fretted him; the vague blue mists that seemed to lift the valleys into prominence and carry the hills farther away, tantalized him; and the spirit of spring, just touching the great woods with a faint suggestion of green, was a mockery. There was a purpose—a decisiveness—in the stride of his horse that he envied, and yet he was inclined to resent the swift amiability with which the animal moved away.

But it was a wise steed, for when it came upon Sis Poteet standing by the side of the road, it threw up its head and stopped. Woodward lifted his hat, and held it in his hand. She gave him one little glance, and then her eyes drooped.

"I wanted to ask you something," she said, pulling a dead leaf to pieces. Her air of humility was charming. She hesitated a moment, but Woodward was too much astonished to make any reply. "Are you very mad?" she asked with bewitching inconsequence.

"Why should *I* be mad, Miss Sis? I am glad you have given me the opportunity to ask your pardon for coming up here to worry you."

"I wanted to ask you if pap—I mean, if father went to Atlanta to see you," she said, her eyes still bent upon the ground.

"He said he wanted to see me on business," Woodward replied.

"Did he say anything about me?"

"Not that I remember. He never said anything about his business, even," Woodward went on. "I told him about some of my little troubles, and when he found I was coming back here, he seemed to forget all about his own business. I suppose he saw that I wouldn't be much interested in anybody else's business but my own just then."

Sis lifted her head and looked steadily at Woodward. A little flush appeared in her cheeks, and mounted to her forehead, and then died away.

"Pap doesn't understand—I mean he doesn't understand everything, and I was afraid he had—— Why do you look at me so?" she exclaimed, stopping short, and blushing furiously.

"I ask your pardon," said the young man; "I was trying to catch your meaning. You say you were afraid your father——"

"Oh, I am not afraid now. Don't you think the weather is nice?"

Woodward was a little puzzled, but he was not embarrassed. He swung himself off his horse and stood beside her.

"I told your father," he said, drawing very near to the puzzling creature that had so willfully eluded him—"I told your father that I was coming up here to ask his daughter to marry me. What does the daughter say?"

She looked up in his face. The earnestness she saw there dazzled and conquered her. Her head drooped lower, and she clasped her hands together. He changed his tactics.

"Is it really true, then, that you hate me?"

"Oh! if you only *knew!*" she cried, and with that, Woodward caught her in his arms.

An old woman, gray-haired, haggard and sallow, who had been drawn from the neighborhood of Hog Mountain by the managers of the Atlanta Cotton Exposition to aid in illustrating the startling contrasts that the energy and progress of man have produced, had but one vivid remembrance of that remarkable display. She had but one story to tell, and, after the Exposition was over, she rode forty miles on horseback, in the mud and rain, to tell it at Teague Poteet's.

"I wish I may die," she exclaimed, flinging the corners of her shawl back over her shoulders, and dipping her clay pipe in the glowing embers—"I wish I may die ef I ever see sech gangs, an' gangs, an' *gangs* of

folks, an' ef I git the racket out'n my head by next Chris'mas, I'll be *mighty* lucky. They sot me over ag'in the biggest fuss they could pick out, an' gimme a pa'r of cotton kyards. Here's what kin kyard when she gits her han' in, an' I b'leeve'n my soul I kyarded 'nuff bats to thicken all the quilts betwix' this an' Californy. The folks, they 'ud come an' stan', and star', an' then they 'ud go some'rs else; an' then new folks 'ud come, an' stan', an' star', an' go some'rs else. They wuz jewlarkers thar frum ever'wheres, an' they lookt like they wuz too brazen to live skacely. Not that *I* keerd. No, bless you! Not when folks is a-plumpin' down the cash money. Not me. No, siree. I wuz a-settin' thar one day, a-kyardin' away, a-kyardin' away, when all of a sudden some un retched down an' grabbed me 'roun' the neck, an' bussed me right here on the jaw. Now, I haint a-tellin' you no lie, I like to 'a' fainted. I lookt up, an' who do you reckon it wuz?"

"I bet a hoss," said Teague dryly, "that Sis wa'n't fur from thar when that bussin' wuz a-gwine on."

"Who should it be *but* Sis!" exclaimed the old woman. "Who else but Sis wuz a-gwine to grab me an' gimme a buss right here on the jaw frontin' of all them jewlarkers? When I lookt up an' seen it twuz Sis, I thought in my soul she'uz the purtiest creatur I ever led eyes on. 'Well, the Lord love you, Sis!' s' I, 'Whar on the face of the yeth did you drap frum?' s' I. I ketched 'er by the arm and helt 'er off, and s' I, 'Ef I don't have a tale to tell when I git home, no 'oman never had none,' s' I. She took an' buss'd me right frontin' of all them jewlarkers, an' airter she 'uz gone, I sot down an' had a good cry.'

And then, the old woman fell to crying softly at the remembrance of it, and those who sat around the wide hearth cried with her. And narrow as their lives are, the memory of the girl seemed to sweeten and inspire all who sat around the hearth that night at Teague Poteet's.

ON THE TRAINING OF CHILDREN'S VOICES.

To the Editor of The Century.

Dear Sir: It gives me much pleasure to comply with your request to write an introduction to my friend Mr. W. L. Tomlins' article on the training of children's voices.

In a brief and necessarily hasty paper on "Musical Possibilities in America," which, at the request of its editor, I prepared for this magazine in March, 1881, I took occasion to express my emphatic disapproval of the system of musical instruction which prevails in the public schools. My remarks upon this subject excited wide and animated discussion, and letters from music teachers and students poured in upon me from all directions. They were mainly in sympathy with the views I had expressed, and afforded gratifying evidence of a general desire for progress toward better things. I am glad to take this opportunity to acknowledge them, and to express my regret that the pressure of constant and exacting duties made individual replies to them impossible. Many of them came from superintendents and other school officers, expressing an earnest wish to carry out the reform suggested, and asking for specific directions and personal suggestions. To give these, required time which I could not command. It was with the greatest reluctance that I consented to write at all, and I only did so with the hope that, by mentioning abuses which had come within my observation, I could awaken discussion and prompt others whose talents more especially fit them for the work to point out the methods best adapted to secure the needed reforms.

On one important point, the treatment of the voice, this hope has been completely realized. In the paper alluded to, after speaking of the harm done to children by allowing them to scream instead of sing, I said: "I was once asked by a gentleman what he ought to do to make his children musical. I told him to form for them a singing-class under the care of a good teacher." By a "good teacher," I mean a man who is competent to give instruction not only in reading music but also in the proper use of the vocal organs. It rarely happens that these qualities are combined in one teacher. Instruction in the use of the voice ought only to be given by a teacher who has made the development of the voice a special study. Teachers ought to be trained to combine both branches of instruction. At present this is not the case. The children are taught to read music, without being taught how to form a good tone. If it be objected that the classes are too large in our schools to make such teaching in singing practicable, the reply is, that the experiment has already been successfully made. Mr. Tomlins began last fall a pioneer work of this kind. He formed a class of children, numbering between two hundred

and three hundred, and began work with them by methods which are best described by himself in a letter received by me a few months ago, just before a visit to Chicago, where I was present at a first exhibition of his class. In that letter, written for my private information, and with no idea that it would be published, he said:

"Your time in Chicago is so short that I advise you in advance in regard to the children's class, telling you what I have endeavored to do, and my plan of working. I found the voices loud and hard, as children's voices are. Directly I reduced the improper muscular action the voices became weak, husky, and very flat, and soon became tired. The proper muscles were unused to action, and the sprained condition of the throats also contributed to this state of things. I therefore rested them (from all but the slightest work) for weeks, and devoted most time to the strengthening of the chest muscles. Cultivating the ability to throw a steady but very light stream of breath through the throat. At last I reduced this stream of air to a softness equal to the faint ability of the throat to chop it into vibration. And from this point we began to build. With many goings back for the sake of the weaker ones and on account of overdoing and on account of climate changes which so readily affect voices in such a condition.

"I began first with 'm' (humming), then 'e' and 'o,' alternating these vowels on a single note; then changing two or three notes on a single vowel; then changing vowels and notes. From this point we worked the many vowel and consonant forms and combinations up to words and sentences. I found, however, that after mechanical correctness was acquired, the most rapid advancement was made by appealing to their emotional natures; in this respect they made greater progress than any adult class I ever taught.

"The stiff, stolid singing of a chorus is its greatest curse. A solo vocalist naturally smiles, relaxing the muscles of the neck and head. A chorus-singer gets dignified, and in public, especially, hardens the muscles of the throat, obstructing the breath, and injuring the tone. Now I have noticed that the children, in reciting lessons or singing, indulge in this bad habit and produce the bad tone; but in the play-room they relax, and under the influence of emotions, playing various characters as they do, the tone becomes lighter and better. And so we have all sorts of things played in class. In a cradle-song we have played that Dolly was sick and had to be soothed to sleep, as mamma has soothed us when we were sick. We have played 'ladies and gentlemen' (polite people), smiling and singing softly to each other.

"And to get an active action of the face and throat (by active I mean that action which is used to influence others, earnest, fervent speech or song). We have played circus-clowns paid to sing to the people to make them laugh.

"During the past two weeks we have taken a soldier's song, playing soldiers who were marching to surprise an enemy, singing with precision and sharp jaw-action for the march, but with *softness* for the surprise. This tends to break down the common habit of singing sluggishly when one sings softly.

"Of course, all this is in miniature; ounces instead of pounds of voice. But the ounce must contain the germ of all that is good in singing — the smile and the sigh are the first steps in emotional tone, and thus far have we gone.

"I have wasted no time in the work of ordinary singing-schools; in the first place, because this is the experimental part, and, to my mind, the important work. Music notation, reading music, singing together, watching the leader, singing in parts, etc., are all necessary, but not *so* necessary. All of these, we can take for granted, will come in time."

The singing of the children, as I heard it on that occasion, demonstrated the soundness of Mr. Tomlins' theories, and his rare abilities as a teacher. They showed ease, spontaneity, warmth, expression, accuracy of pitch, precision;—in fact, came so near to perfection, that I assured them I had never before heard such beautiful singing. From that time I have naturally been deeply interested in Mr. Tomlins' work, and I cordially recommend all persons whose attention has been drawn to this important field of instruction to read, in the first place, his exposition of his theories as unfolded in the subjoined article; and, in the second place, to improve the first opportunity which presents itself of witnessing the results of his work among the children of Chicago.

Theodore Thomas.

WHEN the study of singing was first introduced into the public schools of Boston, the most utopian anticipations were indulged in with regard to the degree and value of the musical culture that would then become the acquisition of every child. Two advantages, in particular, were counted upon: That fluent singing by note would become common, and that a foundation would be laid for a genuine appreciation of good music. To some extent, these expectations have been realized. A certain very moderate knowledge of musical notation has become general among the younger people — not only of that city but of almost all other cities throughout the country, for into nearly all of them music has been introduced. Even this moderate facility in reading music has served as a means of enlarging the pupil's practical acquaintance with musical literature, and to that extent the school instruction has done something to advance musical taste.

But, on the other hand, it is very far from the truth, that the ability has become general to sing accurately by note any but the simplest music, even among the more musical of the students in these schools. It is equally doubtful whether the wider dissemination of musical taste is to any considerable extent related to the public school instruction in music.

There is, however, a more serious question which deserves to be considered. It is, whether the exercise of singing as commonly conducted in the public schools is not positively harmful to the voice and destructive to future ability to sing artistically.

Briefly mentioned, the faults of current instruction are these: Everything is sacrificed

to a knowledge of musical notation. The voice is developed only in respect to power, and this, unfortunately, in a way which must be entirely undone whenever the study of artistic singing is begun. Instead of soft, pleasant, expressive voices, one hears in school almost universally a hard, shouty tone, unsympathetic and inexpressive. This tone is produced by an improper action of the throat which absolutely prevents the production of an emotional tone. In this way is formed a bad habit which must be entirely undone before expression can be acquired. Singing thus conducted is not even a healthful exercise, for it engenders vocal habits which react unfavorably upon the throat.

Nor do the musical text-books exhibit a real progressiveness toward higher and nobler ideas. How far this is the case will appear as soon as we compare the singing-books with the ordinary school readers. In the latter the child begins with easy words and very simple thoughts. From this he is led to longer words, more involved sentences, and more mature ideas. The progress does not stop short of Shakspere and Milton. Instead of such a progressive course in music, the pupil is held to the lower grade. Even where the difficulties of music-reading are gradually increased, the musical ideas are not correspondingly raised.

All of these short-comings finally reduce themselves to two, namely: Ignorance of or indifference to the physiological relation between singing and the vocal organs; and second, apathy with regard to all kinds of musical relations beyond the simplest and most obvious.

This state of things, which prevails for the most part throughout the country, is to be accounted for, or at least, has been influenced by two or three circumstances. The music teachers are chosen mainly for their knowledge of notation and the sight-reading of music. They are generally earnest, practical teachers, with perhaps a turn for music, but with no systematized training in the physiology of the vocal organs, and without practical acquaintance with the technic of vocal culture. They are precentor-like singers, with loud, unsympathetic voices, and with a low grade of musical ideas.

Another cause of trouble has been the text-books, which have catered to this musical ignorance. The Sunday-school singing-books and the Moody and Sankey hymns are for the most part written down to the market demands. That they sell as readily as dime novels is good for trade; that they are as readily discarded for newer books is also good for trade. But educational work, musical or otherwise, should be above such mercenary motives.

The advantages proper to be sought by instruction in singing in the public schools would seem to be these and in this order:

First. The cultivation of a musical voice. This embraces not only the proper utterance of thought in speech and song, but its appropriate coloring by an emotional character of voice. The presence of this quality determines that the mechanism of the voice is in right action, for any impropriety in tone-production will immediately reveal itself in the form of a hard or unmusical and inexpressive tone.

Second. The "How to observe good music," or the ability to perceive and feel musical relations. This includes a familiarity with the primary principles of music, the habits of chords, an analysis of forms, simple exercises in musical construction, primary rhythms,—in fact, an appreciation of the thing, Music, apart from its sign, musical notation. All this may be delightfully taught in connection with singing and listening to good music.

Third. Knowledge of musical notation and the ready reading of new music.

Fourth. Acquaintance with musical literature.

To these may be added the practice of singing as a recreation and healthful exercise.

In regard to the relative importance of these proposed ends of musical instruction in schools, there appears to be no room for reasonable difference of opinion.

A pleasant voice is eminently desirable both for ease in using it (for ease and pleasing quality go together) and for the sake of clearness in expressing refined shades of meaning, as well as the agreeable impression it makes upon others. All our life long we are addressing ourselves to others, frequently in cases where it makes a considerable difference to ourselves whether we commend our cause or not. Hence a pleasant voice is greatly to be desired, and can be acquired by almost every one if right methods of speaking and singing are formed in childhood.

The disposition of the technical means necessary for attaining these advantages would amount almost to a complete reversal of the methods now prevailing.

Proper methods of singing demand that the flow of the air-column which passes the throat of a singer shall be (1) controlled and regulated entirely by the action of the lungs, (2) transformed into the higher power of vibration by the action of the throat, and (3) shaped into vowel and consonant combinations in its further progress through the chambers of the upper throat and head. The breath is both the substance and the motive power of vocalization, as a current of air in forcing itself through a revolving ventilator will compel it to action and be thereby transformed into vibration.

The machinery of a child's voice must run with the minimum of effort. The slightest excess will provoke a rigidity of the throat and head, and thereby prevent the sympathetic response of those resonant cavities of the head and chest which reflect the vibrations of the throat, and in voices, as in the violin, impart sonority and musical quality to the tone.

Singing, therefore, should never be accompanied by physical exertion, nor should the vocal exercises of the school immediately follow the exertions of the play-ground. The panting of the breath directs the blood to the throat and lungs, and involves an action of the extrinsic muscles of the throat, which directly antagonizes the proper act of singing. Nor is the effect confined to the short period of being out of breath. It is a fact well known to voice-trainers, that any physical effort which induces labored breathing thickens the voice for at least an hour. For this reason energetic dancers never have good voices.

It would be impossible, within present limits, to enumerate the many forms of wrong-doing in which children are indulged, or to explain the exercises which are necessary to correct them. An analysis of these bad habits would prove them to be for the most part but the natural outgrowth of an underlying principle of wrong, namely, the attempt to control and regulate the air-column by an improper contraction of the throat.

A second point is that children's voices should be very soft. The vocal chords in a child's throat are not able to withstand any overpressure of the breath. How often one may observe among singers and preachers that a voice which is agreeable and winning when used in moderation becomes repelling and unsympathetic directly too much emphasis or power is employed.

Another point of complaint is that children's voices are commonly used at a low pitch, a custom sanctioned by authorities, but nevertheless a faulty one. The natural voice of a child is soft and high: neither shrill nor harsh, but of low power and high pitch. This is reasonable, for at the age of five or six years, the child's larynx is retarded in its growth, and does not materially increase in size until about the age of fourteen, when by a year or two of rapid growth it is enlarged to adult size. Prior to this period of "change of voice," a child's larynx is in proportion to a woman's as 3 to 5, and to a man's as 3 to 7. Children's voices, therefore, are naturally higher than those of women, as women's are higher than men's. It is true that the children as at present taught are unable to reach the high notes. As well might a violinist expect to obtain the upper tones of his instrument by tightening instead of shortening the string. Listen to the soft laugh of a child when a smile has relaxed the muscular contraction of the throat, and the true childish ring will be heard, charming as it is.

It is an unfortunate phase of this subject that wrong habits have been formed that will not be corrected by those practices which in the beginning would have prevented them. The experience of many who have studied with good teachers testifies to years of tedious study and undoing.

In this connection a lesson can be learned by contrasting the voices of the boys in a play-ground of one of the cathedral schools in Europe, schools consisting only of children of a surpliced choir, with those of a company of street *gamins* whose habits incline them to vehement assertion. The former are gentle, distinguished, genteel in quality; the latter, hard, strident, and coarse.

In fact, the vocal trouble complained of is largely induced in the play-ground, where loud talking is accompanied by excessive physical exercise. While it is impossible to control fully the evil in the play-ground, it is quite possible to modify it at home and in school by proper habits of speaking and singing. The personal experience of the writer has afforded him unusual facilities for the examination of young people's voices, and testifies to the terrible effects of improper singing in day-schools and Sunday-schools: voices wrenched by over-effort out of all semblance to proper vocalism, and sprained throats with their baneful results to health. Children whose gifts of voice or musical ability have fitted them for leadership have suffered in greater proportion and to a greater degree.

While it is an open question as to the amount of musical instruction which should be included in the system of school teaching, there can be no doubt that, whether the exercise of singing be undertaken as a study or a recreation, some reform should be adopted which will save the children's voices from injury by day-school teachers, whose musical ability lies solely in their knowledge of musical notation, and from Sunday-school leaders who ruin young and delicate voices by bad examples and injudicious precepts.

In the nature of the case, such a reform can take no other shape than the general observance of the fundamental principles of good vocalization, as indicated above; and this, in turn, must be accomplished through a general dissemination of proper knowledge among teachers, which might perhaps be done through the normal schools and teachers' institutes.

SONGS.

ONE.

One day is gladdest of the year,
One loveliest when shadows near;
One cloud floats softest, lone and high,
One star is brightest of the sky.

One tint lies fairest on the hill,
One glance flies brightest from the rill;
One whitest lily, reddest rose,—
None other such the summer knows.

Once come and gone the one dear face,
Forever empty is its place;
Only one voice the lover hears,
Sounding across the waste of years.

Only one spirit rules the breast,
Be it in waking or in rest;
Only one lays, at will, the spell
Subduing as when first it fell.

Of all the myriad things that prove
The human heart was framed to love,
Wise nature never suffers two
To mate the soul as one shall do.

SUMMER NOON.

A summer noon is this,
The trees are breathless, every one;
Underneath the shadow is,
And overhead the sun.

No mowers in the mead,
No children on the green at play;
Listless drops the thistle seed
Beside the traveled way.

Alone, the butterfly
Floats dreamily in lower air;
And the circling hawk on high
Is all that's moving there.

The brook runs ever by,
But seems to pause the while it flows;
'Tis more like a line of sky,
So placidly it goes.

THE OLD TREE.

Yon stricken monarch—lifeless form!—
No longer braves the winter storm;
Tempest, at last, and length of days
Have mastered: lo! the king decays.

Once its proud head, now lopped and seared,
Was greenest in the forest reared;
And from its royal boughs were heard
The sweetest songs of summer-bird.

Time was when, cool beneath its shade,
At noon the lordlier cattle laid;
When to its arms the squirrel ran,
And eyed, secure, designing man.

Years since, I climbed that highest bough;
Only the hawk dare trust it now.
Alas! I, too, was younger then—
We go together, oaks and men!

How like our own last reach of pray'r,
Those empty hands uplitt in air;
Our own stern close with destiny
The struggle of the aged tree!

EVENING.

Behind the hill-top drops the sun,
The curled heat falters on the sand;
While evening's ushers, one by one,
Lead in the guests of twilight-land.

The bird is silent overhead,
Below the beast has lain him down;
Alone the marbles watch the dead,
Alone the steeple guards the town.

The south wind feels its amorous course
To cloistered sweets in thickets found;
The leaves obey its tender force,
And stir 'twixt silence and a sound.

John Vance Cheney.

FATHER JUNIPERO AND HIS WORK.

A SKETCH OF THE FOUNDATION, PROSPERITY, AND RUIN OF THE FRANCISCAN MISSIONS IN CALIFORNIA. II.

If the little grief-stricken band of monks who stood weeping around Junipero Serra's grave in 1784 could have foreseen the events of the next thirty years, their weeping would have been turned into exultant joy. But not the most daring enthusiast among them could have dreamed of the harvest of power destined to be raised from the seed thus sown in weakness.

Almost with his dying breath Father Junipero had promised to use "all his influence with God" in behalf of the missions. In the course of the next four months after his death more converts were baptized than in the whole three years previous; and it became at once the common belief that his soul had passed directly into heaven, and that this great wave of conversions was the result of his prayers. Prosperity continued steadily to increase. Mission after mission was successfully founded, until, in 1804, the occupation of the sea-coast line from San Francisco to San Diego was complete, there being nineteen mission establishments only an easy day's journey apart from each other.

The ten new missions were founded in the following order: Santa Barbara, December 4, 1786; La Purissima, December 8, 1787; Santa Cruz, September 25, 1791; Soledad, October 9, 1791; San José, June 11, 1797; San Juan Bautista, June 24, 1797; San Miguel, July 25, 1797; San Fernando Rey, September, 8, 1797; San Luis Rey de Francia, June 18, 1798; Santa Inez, September 7, 1804.

Beginnings had also been made on a projected second line, to be from thirty to fifty miles back from the sea, and this inland chain of settlements and development promised to be in no way inferior to the first. The wealth of the mission establishments had grown to an almost incredible degree. In several of them massive stone churches had been built, of an architecture at once so simple and harmonious that, even in ruins, it is to-day the grandest in America; and it will remain, so long as arch, pillar, or dome of it shall stand, a noble and touching monument of the patient Indian workers who built, and of the devoted friars who designed, its majestic and graceful proportions.

In all of the missions were buildings on a large scale, providing for hundreds of occupants, for all the necessary trades and manufactures, and many of the ornamental arts of civilized life. Enormous tracts of land were under high cultivation; the grains, and cool fruits of the temperate zone, flourishing, in the marvelous California air, side by side with the palm, olive, grape, fig, orange, and pomegranate. From the two hundred head of cattle sent by the wise Galvez had grown herds past numbering; and to these had been added vast flocks of sheep, and herds of horses. In these nineteen missions were gathered over twenty thousand Indians, leading regular and industrious lives, and conforming to the usages of the Catholic religion.

A description of the San Luis Rey mission, written by De Mofras, an attaché of the French Legation in Mexico in 1842, gives a clear idea of the form, and some of the methods of the mission establishments.

> "The building is a quadrilateral, four hundred and fifty feet square; the church occupies one of its wings; the façade is ornamented with a gallery. The building is two stories in height. The interior is formed by a court ornamented with fountains, and decorated with trees. Upon the gallery which runs around it open the dormitories of the monks, of the major-domos, and of travelers, small work-shops, school-rooms and store-rooms. The hospitals are situated in the most quiet parts of the mission, where also the schools are kept. The young Indian girls dwell in halls called monasteries, and are called nuns. Placed under the care of Indian matrons, who are worthy of confidence, they learn to make cloth of wool, cotton, and flax, and do not leave the monastery until they are old enough to be married. The Indian children mingle in schools with those of the white colonists. A certain number chosen among the pupils who display the most intelligence learn music, chanting, the violin, flute, horn, violoncello, or other instruments. Those who distinguish themselves in the carpenters' shops, at the forge, or in agricultural labors, are appointed alcaldes or overseers, and charged with the directions of the laborers."

Surrounding these buildings, or arranged in regular streets upon one side of them, were the homes of the Indian families. These were built of adobe, or of reeds, after the native fashion. The daily routine of the Indians' life was simple and uniform. They were divided into squads of laborers. At sunrise, the Angelus bell called them to mass. After the mass they breakfasted, and then dispersed to their various labors. At eleven, they were

again summoned together for dinner, after which they rested until two, when they went again to work, and worked until the evening Angelus just before sunset. After prayers and supper, they were in the habit of dancing and playing games until bedtime. Their food was good. They had meat at noon accompanied by *posale*, a sort of succotash made of corn, beans, and wheat, boiled together. Their breakfast and supper were usually of porridge made from different grains, called *atole* and *pinole*.

The men wore linen shirts, pantaloons, and blankets. The overseers and best workmen had suits of cloth like the Spaniards. The women received every year two chemises, one gown, and a blanket. De Mofras says:

"When the hides, tallow, grain, wine, and oil were sold at good prices to ships from abroad, the monks distributed handkerchiefs, wearing apparel, tobacco, and trinkets among the Indians, and devoted the surplus to the embellishment of the churches, the purchase of musical instruments, pictures, church ornaments, etc.; still they were careful to keep a part of the harvest in the granaries to provide for years of scarcity."

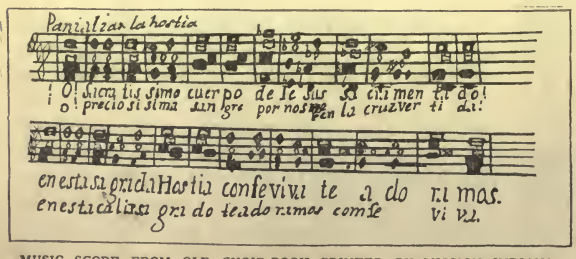
The rule of the friars was in the main a kindly one. The vice of drunkenness was severely punished by flogging. Quarreling between husbands and wives was also dealt with summarily, the offending parties being chained together by the leg till they were glad to promise to keep peace. New converts and recruits were secured in many ways; sometimes by sending out parties of those already attached to the new mode of life, and letting them set forth to the savages the advantages and comforts of the Christian way; sometimes by luring strangers in with gifts; sometimes, it is said, by capturing them by main force; but of this there is only scanty evidence, and it is not probable that it was often practiced. It has also been said that cruel and severe methods were used to compel the Indians to work; that they were driven under the lash by their overseers, and goaded with lances by the soldiers. No doubt there were individual instances of cruelty; seeds of it being indigenous in human nature, such absolute control of hundreds of human beings could not exist without some abuses of the power. But that the Indians were, on the whole, well treated and cared for, the fact that so many thousands of them chose to remain in the missions is proof. With open wilderness on all sides, and with thousands of savage friends and relatives close at hand, nothing but their own free will could have kept such numbers of them loyal and contented. Forbes, in his history of California, written in 1832, says:

"The best and most unequivocal proof of the good conduct of the fathers is to be found in the unbounded affection and devotion invariably shown toward them by their Indian subjects. They venerate them not merely as friends and fathers, but with a degree of devotion approaching to adoration."

The picture of life in one of these missions during their period of prosperity is unique and attractive. The whole place was a hive of industry: trades plying indoors and outdoors; tillers, herders, vintagers by hundreds, going to and fro; children in schools; women spinning; bands of young men practicing on musical instruments; music, the scores of which, in many instances, they had themselves written out; at evening, all sorts of games of running, leaping, dancing, and ball-throwing, and the picturesque ceremonies of a religion which has always been wise in availing itself of beautiful agencies in color, form, and harmony.

At every mission were walled gardens with waving palms, sparkling fountains, groves of olive trees, broad vineyards, and orchards of all manner of fruits; over all, the sunny, delicious, winterless California sky.

More than mortal, indeed, must the Franciscans have been, to have been able, under these conditions, to preserve intact the fervor and spirit of self-abnegation and deprivation inculcated by the rules of their order. There is a half-comic pathos in the records of occasional efforts made by one and another of the presidents to check the growing disposition toward ease on the part of the friars. At one time, several of them were found to be carrying silver watches. The watches were taken away, and sent to Guadalajara to be sold, the money to be paid into the Church treasury. At another time, an order was issued, forbidding the wearing of shoes and stockings in place of sandals, and the occupying of too large and comfortable rooms. And one zealous president, finding that the friars occasionally rode in the carts belonging to their missions, had all the carts burned, to compel the fathers to go about on foot.



Panialzar la hostia
O! Sacratissimo cuerpo de Jesus Sacramentado!
O! precio si sima sangre por nosotros en la cruz ver ti do!
en esta sagrada Hostia confesamos te a do ramos.
en esta divina grado teado ramos comfe vi vi.

MUSIC SCORE FROM OLD CHOIR-BOOK PRINTED BY MISSION INDIANS.

BELL-POST AND CORRIDOR AT SAN MIGUEL MISSION.

The friars were forced, by the very facts of their situation, into the exercise of a constant and abounding hospitality, and this of itself inevitably brought about large departures from the ascetic *régime* of living originally preached and practiced. Most royally did they discharge the obligations of this hospitality. Travelers' rooms were kept always ready in every mission; and there were even set apart fruit orchards called "travelers' orchards." A man might ride from San Diego to Monterey by easy day's journeys, spending each night as guest in a mission establishment. As soon as he rode up, an Indian page would appear to take his horse; another to show him to one of the travelers' rooms. He was served with the best of food and wine, as long as he liked to stay, and when he left, he might, if he wished, take from the mission herd a fresh horse to carry him on his journey. All the California voyagers and travelers of the time speak in glowing terms of this generous and cordial entertaining by the friars. It was, undoubtedly, part of their policy as representatives of the State, but it was no less a part of their duty as Franciscans.

Some of the highest tributes which have been paid to them, both as men and as administrators of affairs, have come from strangers who, thus sojourning under their roofs, had the best opportunity of knowing their lives. Says Forbes:

"Their conduct has been marked by a degree of benevolence, humanity, and moderation probably unexampled in any other situation."

"I have never heard that they have not acted with the most perfect fidelity, or that they ever betrayed a trust, or acted with inhumanity."—Forbes's "California."

This testimony is of the more weight that it comes from a man not in sympathy with either the religious or the secular system on which the friars' labors were based.

The tales still told by old people of festal occasions at the missions sound like tales of the Old World rather than of the New. There was a strange difference, fifty years ago, between the atmosphere of life on the east and west sides of the American continent: On the Atlantic shore, the descendants of the Puritans, weighed down by serious purpose, half grudging the time for their one staid yearly Thanksgiving, and driving the Indians farther and farther into the wilderness every year, fighting and killing them; on the sunny Pacific shore, the merry people of Mexican and Spanish blood, troubling themselves about nothing, dancing away whole days and nights like children, while their priests were gathering the Indians by thousands into communities, and feeding and teaching them.

The most beautiful woman known in California a half-century ago, still lives in Santa Barbara, white-haired, bright-eyed, eloquent-tongued to-day. At the time of her marriage, her husband being a brother of the superior of the Santa Barbara mission, her wedding banquet was spread on tables running the whole length of the outer corridor of the mission. For three days and three nights the feasting and dancing were kept up, and the whole town was bid. On the day after her wedding came the christening or blessing of the right tower of the church. She and her husband, having been chosen godfather and godmother to the tower, walked in solemn

procession around it, carrying lighted candles in their hands, preceded by the friar, who sprinkled it with holy water and burned incense. In the four long streets of Indians' houses, then running eastward from the mis-

A CAPACIOUS FIRE-PLACE—SAN LUIS REY.

sion, booths of green boughs, decorated with flowers, were set up in front of all the doors. Companies of Indians from other missions came as guests, dancing and singing as they approached. Their Indian hosts went out to meet them, also singing, and pouring out seeds on the ground for them to walk on. These were descendants of the Indians who, when Viscayno anchored off Santa Barbara in 1602, came out in canoes, bringing their king, and rowed three times around Viscayno's ship, chanting a chorus of welcome. Then the king going on board the ship, walked three times around the deck, chanting the same song. He then gave to the Spaniards gifts of all the simple foods he had, and implored them to land, promising that if they would come and be their brothers, he would give to each man ten wives.

With the increase of success, wealth, and power on the part of the missions came increasing complexities in their relation to the military settlements in the country. The original Spanish plan of colonization was threefold—religious, military, and civil. Its first two steps were a mission and a presidio, or garrison; the presidio to be the guard of the mission; later was to come the pueblo * or town. From indefiniteness in the understanding of property rights, and rights of authority, as vested under these three heads, there very soon arose confusion, which led to collisions—collisions which have not yet ceased, and never will, so long as there remains a land-title in California to be quarreled over. The law records of the State are brimful of briefs, counter-briefs, opinions, and counter-opinions regarding property issues, all turning on definitions which nobody has now clear right to make, of old pueblo and presidio titles and bounds.

In the beginning there were no grants of land; everything was done by royal decree. In the form of taking possession of the new lands, the Church, by right of sacred honor, came first, the religious ceremony always preceding the military. Not till the cross was set up, and the ground consecrated and taken possession of, in the name of God, for the Church's purposes, did any military commander ever think of planting the royal standard, symbolizing the king's possession. In the early days, the relation between the military and the ecclesiastical representatives of the king were comparatively simple; the soldiers were sent avowedly and specifically to protect the friars; moreover, in those earlier days, soldiers and friars were alike devout, and, no doubt, had the mission interests more equally at heart than they did later. But each year's increase of numbers in the garrisons, and of numbers and power in the missions, increased the possibilities of clashing, until finally the relations between the two underwent a singular reversal; and the friars, if disposed to be satirical, might well have said that, however bad a rule might be which would not work both ways, a rule which did was not of necessity a good one, it being now the duty of the missions to support the presidios; the military governors being authorized to draw upon the friars not only for supplies, but for contributions of money, and for levies of laborers.†

On the other hand, no lands could be set off or assigned for colonists without consent

* The term pueblo answers to that of the English word town, in all its vagueness and all its precision. As the word town in English generally embraces every kind of population from the village to the city, and also, used specifically, signifies a town corporate and politic, so the word pueblo in Spanish ranges from the hamlet to the city, but, used emphatically, signifies a town corporate and politic.—"Dwinelle's Colonial History of San Francisco."

† In the decade between 1801 and 1810 the missions furnished to the presidios about eighteen thousand dollars' worth of supplies each year.

of the friars, and there were many other curious and entangling cross-purpose powers distributed between friars and military governors quite sufficient to make it next to impossible for things to go smoothly.

The mission affairs, so far as their own internal interests were concerned, were administered with admirable simplicity and system. The friars in charge of the missions were responsible directly to the president or prefect of the missions. He, in turn, was responsible to the president or guardian of the Franciscan College in San Fernando, in Mexico. One responsible officer, called procurador, was kept in the city of Mexico to buy supplies for the missions from stipends due, and from the drafts given to the friars by the presidio commanders for goods furnished to the presidios. There was also a syndic or general agent at San Blas, who attended to the shipping and forwarding of supplies. It was a happy combination of the minimum of functionaries with the maximum of responsibility.

The income supporting the missions was derived from two sources, the first of which was a fund, called the "Pious Fund," originally belonging to the Jesuit Order, but on the suppression of that order, in 1868, taken possession of by the Spanish Government in trust for the Church. This fund, begun early in the eighteenth century, was made up of estates, mines, manufactories, and flocks — all gifts of rich Catholics to the Society of Jesus. It yielded an income of fifty thousand dollars a year, the whole of which belonged to the Church, and was to be used in paying stipends to the friars (to the Dominicans in Lower as well as to the Franciscans in Upper California), and in the purchasing of articles needed in the missions. The missions' second source of income was from the sales of their own products; first to the presidios — these sales, paid for by drafts on the Spanish or Mexican Government; second, to trading ships, coming more and more each year to the California coast.

As soon as revolutionary troubles began to agitate Spain and Mexico, the income of the missions from abroad began to fall off. The Pious Fund was too big a sum to be honestly administered by any government hard pressed for money. Spain began to filch from it early, to pay the bills of her wars with Portugal and England; and Mexico, as soon as she had the chance, followed Spain's example vigorously, — selling whole estates, and pocketing their price; farming the fund out for the benefit of the State treasury; and, finally, in Santa Anna's time, selling the whole outright to two banking-houses. During these troublous times, the friars not only failed frequently to receive their regular stipends allotted from the interest of this Pious Fund, but their agent was unable to collect the money due them for the supplies furnished to the presidios. The sums of which they were thus robbed by two governments — that, being ostensibly of the Catholic faith, should surely have held the Church's property sacred — mounted up in a few years to such enormous figures, that restitution would have been practically impossible, and, except for their own internal sources of revenue, the missions must have come to bankruptcy and ruin.

However, the elements which were to bring about this ruin were already at work — were, indeed, inherent in the very system on which they had been founded. The Spanish Government was impatient to see carried out, and to reap the benefit of, the pueblo feature of its colonization plan. With a singular lack of realization of the time needed to make citizens out of savages, it had set ten years as the period at the expiration of which the Indian communities attached to the missions were to be formed into pueblos, — the missions to be secularized, that is, turned into curacies, the pueblo being the parish. This was no doubt the wise and proper ultimate scheme, the only one, in fact, which provided either for the entire civilization of the Indian or the successful colonization of the country. But five times ten years would have been little enough to allow for getting such a scheme fairly under way, and another five times ten years for the finishing and rounding of the work. It is strange how sure civilized peoples are, when planning and legislating for savages, to forget that it has always taken centuries to graft on or evolve out of savagery anything like civilization.

Aiming toward this completing of their colonization plan, the Spanish Government had very early founded the pueblos of Los Angeles and San José. A second class of pueblos, called, in the legal phrase of California's later days, "Presidial Pueblos," had originated in the settlement of the presidios, and gradually grown up around them. There were four of these — San Diego, Monterey, Santa Barbara, and San Francisco.

It is easy to see how, as these settlements increased, of persons more or less unconnected with the missions, there must have grown up discontent at the Church's occupation and control of so large a proportion of the country. Ready for alliance with this discontent was the constant jealousy on the part of the military authorities, whose measures were often — and, no doubt, often rightly — opposed by the friars. These fomenting causes of disquiet reacted on the impatience and greed in

CHURCH AND FOUNTAIN, SANTA BARBARA.

Spain; all together slowly, steadily working against the missions, until, in 1813, the Spanish Cortes passed an act decreeing their secularization. This was set forth in sounding phrase as an act purely for the benefit of the Indians, that they might become citizens of towns. But it was, to say the least of it, as much for Spain as for the Indians; since, by its provisions, one-half of the mission lands were to be sold for the payment of Spain's national debt. This act, so manifestly premature, remained a dead letter; but it alarmed the friars, and with reason. It was the tocsin of their doom, of the downfall of their establishments, and the ruin of their work.

Affairs grew more and more unsettled. Spanish viceroys and Mexican insurgents took turns at ruling in Mexico, and the representatives of each took turns at ruling in California. The waves of every Mexican revolution broke on the California shore. The College of San Fernando, in Mexico, also shared in the general confusion, and many of its members returned to Spain.

From 1817 to 1820 great requisitions were made by the Government upon the missions. They responded generously. They gave not only food, but money. They submitted to a tax, per capita, on all their thousands of Indians, to pay the expenses of a deputy to sit in the Mexican Congress. They allowed troops to be quartered in the mission buildings. At the end of the year 1820 the outstanding drafts on the Government, in favor of the missions, amounted to four hundred thousand dollars.

It is impossible, in studying the records of this time, not to feel that the friars were, in the main, disposed to work in good faith for the best interests of the State. That they opposed the secularization project is true; but it is unjust to assume that their motives in so doing were purely selfish. Most certainly, the results of the carrying out of that project

IN THE MISSION GARDEN, SAN JUAN BAUTISTA.

were such as to prove all that they claimed of its untimeliness. It is easy saying, as their enemies do, that they would never have advocated it, and were not training the Indians with a view to it; but the first assertion is an assumption, and nothing more; and the refutation of the second lies in the fact that, even in that short time, they had made the savages into "masons, carpenters, plasterers, soap-makers, tanners, shoe-makers, blacksmiths, millers, bakers, cooks, brick-makers, carters and cart-makers, weavers and spinners, saddlers, ship hands, agriculturists, herdsmen, vintagers; — in a word, they filled all the laborious occupations known to civilized society."* Moreover, in many of the missions, plots of land had already been given to individual neophytes who seemed to have intelligence and energy enough to begin an independent life for themselves. But it is idle speculating now as to what would or would not have been done under conditions which never existed.

So long as Spain refused to recognize Mexico's independence, the majority of the friars, as was natural, remained loyal to the Spanish Government, and yielded with reluctance and under protest, in every instance, to Mexico's control. For some years President Sarria was under arrest for refusing to take the oath of allegiance to the Mexican republic. Nevertheless, it not being convenient to remove him and fill his place, he performed all his functions as president of the missions through that time. Many other friars refused to take the oath, and left the country in consequence. During three years the secularization project was continually agitated, and at intervals measures initiatory to it were decreed and sometimes acted upon.

The shifting governors of unfortunate California legislated for or against the mission interests according to the exigencies of their needs or the warmness or lukewarmness of their religious faith.

* Special Report of the Hon. B. D. Wilson, of Los Angeles, Cal., to the Interior Dept. in 1852.

An act of one year, declaring the Indians liberated, and ordering the friars to turn over the mission properties to administrators, would be followed a few years later by an act restoring the power of the friars, and giving back to them all that remained to be rescued of the mission properties and converts. All was anarchy and confusion. During the fifty-five years that California was under Spanish rule she had but nine governors. During the twenty-four that she was under Mexican misrule she had thirteen. It would be interesting to know what the Indian populations thought, as they watched these quarrelings and intrigues among the Christians who were held up to them as patterns for imitation.

In a curious pamphlet left by one of the old friars, Father Boscana, is told a droll story of the logical inferences some of them drew from the political situations among their supposed betters. It was a band of San Diego Indians. When they heard that the Spanish viceroy in the city of Mexico had been killed, and a Mexican made emperor in his place, they forthwith made a great feast, burned up their chief, and elected a new one in his stead. To the stringent reproofs of the horrified friars they made answer: "Have you not done the same in Mexico? You say your king was not good, and you killed him. Well, our captain was not good, and we burned him. If the new one turns out bad, we will burn him, too,"—a memorable instance of the superiority of example to precept.

At last, in 1834, the final blow fell on the missions. The Governor of California, in compliance with instructions received from Mexico, issued an authoritative edict for their secularization. It was a long document, and had many significant provisions in it. It said that the Indians were now to be "emancipated." But the 16th article said that they "should be obliged to join in such labors of community as are indispensable, in the opinion of the political chief, in the cultivation of the vineyards, gardens, and fields, which for the present remain unapportioned." This was a curious sort of emancipation, and it is not surprising to read, in the political records of the time, such paragraphs as this: "Out of one hundred and sixty Indian families at San Diego, to whom emancipation was offered by Governor Figueroa, only ten could be induced to accept it." The friars were to hand over all records and inventories to stewards or administrators appointed. Boards of magistrates were also appointed for each village. One-half of the movable property was to be divided among the "emancipated persons," and to each head of a family was to be given four hundred square yards of land. Everything else—lands, movable properties, property of all classes—was to be put into the hands of the administrator, to be held subject to the Federal Government. Out of these properties the administrators were to provide properly for the support of the father or fathers left in charge of the church, the church properties, and the souls of the "emancipated persons." A more complete and ingenious subversion of the previously existing state of things could not have been devised, and it is hard to conceive how any student of the history of the period can see, in its shaping and sudden enforcing, anything except bold and unprincipled greed hiding itself under specious cloaks of right.

"Beneath these specious pretexts," says Dwinelle, in his "Colonial History," "was undoubtedly a perfect understanding between the Government of Mexico and the leading men in California, that in such a condition of things the Supreme Government might absorb the Pious Fund, under the pretense that it was no longer necessary for missionary purposes, and thus had reverted to the State as a quasi escheat, while the co-actors in California should appropriate the local wealth of the missions, by the rapid and sure process of administering their temporalities."

Of the manner in which the project was executed, Dwinelle goes on to say: "These laws, whose ostensible purpose was to convert the missionary establishments into Indian pueblos, their churches into parish churches, and to elevate the Christianized Indians to the rank of citizens, were after all executed in such a manner that the so-called secularization of the missions resulted in their plunder and complete ruin, and in the demoralization and dispersion of the Christianized Indians."

It is only just to remember, however, that these laws and measures were set in force in a time of revolution, when even the best measures and laws could have small chance of being fairly executed, and that a government which is driven, as Mexico was, to recruiting its colonial forces by batches of selected prison convicts, is entitled to pity, if not charity in our estimates of its conduct. Of course, the position of administrator of a mission became at once a political reward and a chance for big gains, and simply, therefore, a source and center of bribery and corruption.

Between the governors—who now regarded the mission establishments as state property, taking their cattle or grain as freely as they would any other revenue, and sending orders to a mission for tallow, as they would draw

checks on the treasury—and the administrators, who equally regarded them as easy places for the filling of pockets, the wealth of the missions disappeared as dew melts in the sun. Through all this the Indians were the victims. They were, under the administrators, compelled to work far harder than before: they were ill-fed, and ill-treated; they were hired out in gangs to work in towns or on farms, under masters who regarded them simply as beasts of burden; their rights to the plots of land which had been set off for them were, almost without exception, ignored. A more pitiable sight has not often been seen on earth than the spectacle of this great body of helpless, dependent creatures, suddenly deprived of their teachers and protectors, thrown on their own resources, and at the mercy of rapacious and unscrupulous communities, in time of revolution. The best comment on their sufferings is to be found in the statistics of the mission establishments after a few years of the administrators' reign.

In 1834 there were, according to the lowest estimates, from fifteen to twenty thousand Indians in the missions. De Mofras's statistics give the number as 30,620. In 1840 there were left, all told, but six thousand. In many of the missions there were less than one hundred. According to De Mofras, the cattle, sheep, horses, and mules, in 1834, numbered 808,000; in 1842, but 6320. Other estimates put the figures for 1834 considerably lower. It is not easy to determine which are true; but the most moderate estimates of all tell the story with sufficient emphasis. There is also verbal testimony on these points still to be heard in California, if one has patience and interest enough in the subject to listen to it. There are still living, wandering about, half-blind, half-starved, in the neighborhood of the mission sites, old Indians who recollect the mission times in the height of their glory. Their faces kindle with a sad flicker of recollected happiness, as they tell of the days when they had all they wanted to eat, and the padres were so good and kind: "*Bueno tiempo! Bueno tiempo,*" they say, with a hopeless sigh and shake of the head.

Under the new régime the friars suffered hardly less than the Indians. Some fled the country, unable to bear the humiliations and hardships of their position under the control of the administrators or major-domos, and dependent on their caprice for shelter and even for food. Among this number was Father Antonio Peyri, who had been for over thirty years in charge of the splendid mission of San Luis Rey. In 1800, two years after its founding, this mission had three hundred and sixty-nine Indians. In 1827 it had two thousand six hundred and eighty-six; it owned over twenty thousand head of cattle, and nearly twenty thousand sheep. It controlled over two hundred thousand acres of land, and there were raised in its fields in one year three thousand bushels of wheat, six thousand of barley, and ten thousand of corn. No other mission had so fine a church. It was one hundred and sixty feet long, fifty wide, and sixty high, with walls four feet thick. A tower at one side held a belfry for eight bells. The corridor on the opposite side had two hundred and fifty-six arches. Its gold and silver ornaments are said to have been superb.

When Father Peyri made up his mind to leave the country, he slipped off by night to San Diego, hoping to escape without the Indians' knowledge. But, missing him in the morning, and knowing only too well what it meant, five hundred of them mounted their ponies in hot haste, and galloped all the way to San Diego, forty-five miles, to bring him back by force. They arrived just as the ship, with Father Peyri on board, was weighing anchor. Standing on the deck, with outstretched arms, he blessed them amid their tears and loud cries. Some flung themselves into the water and swam after the ship. Four reached it, and, clinging to its sides, so implored to be taken that the father consented, and carried them with him to Rome, where one of them became a priest.

There were other touching instances in which the fathers refused to be separated from their Indian converts, and remained till the last by their side, sharing all their miseries and deprivations. De Mofras, in his visit to the country in 1842, found, at the mission of San Luis Obispo, Father Azagonais, a very old man, living in a hut, like the Indians, sleeping on a rawhide on the bare ground, with no drinking-vessel but an ox-horn, and no food but some dried meat hanging in the sun. The little he had he shared with the few Indians who still lingered there. Benevolent persons had offered him asylum, but he refused, saying that he would die at his post. At the San Antonio mission, De Mofras found another aged friar, Father Gutierrez, living in great misery. The administrator of this mission was a man who had been formerly a menial servant in the establishment; he had refused to provide Father Gutierrez with the commonest necessaries, and had put him on an allowance of food barely sufficient to keep him alive.

At Soledad was a still more pitiful case. Father Sarria, who had labored there for thirty years, refused to leave the spot, even

INTERIOR OF LA PURISSIMA MISSION.

after the mission was so ruined that it was not worth any administrator's while to keep it. He and the handful of Indians who remained loyal to their faith and to him lived on there, growing poorer and poorer each day; he sharing his every morsel of food with them, and starving himself, till one Sunday morning, saying mass at the crumbling altar, he fainted, fell forward, and died in their arms, of starvation. This was in 1838. Only eight years before, this Soledad Mission had owned thirty-six thousand cattle, seventy thousand sheep, three hundred yoke of working oxen, more horses than any other mission, and had an aqueduct, fifteen miles long, supplying water enough to irrrigate twenty thousand acres of land.

For ten years after the passage of the Secularization Act affairs went steadily on from bad to worse with the missions. Each governor had his own plans and devices for making the most out of them, renting them, dividing them into parcels, for the use of colonists, establishing pueblos on them, making them subject to laws of bankruptcy, and finally selling them. The departmental assemblies sometimes indorsed and sometimes annulled the acts of the governors. In 1842, Governor Micheltorena proclaimed that the twelve southern missions should be restored to the Church, and that the Government would not make another grant of land without the consent of the friars. This led to a revolution or rather an ebullition, and Micheltorena was sent out of the country. To him succeeded Pio Pico, who remained in power till the occupation of California by the United States forces in 1846. During the reign of Pio Pico, the ruin of the mission establishments was completed. They were at first sold or rented in batches to the highest bidders. There was first a preliminary farce of proclamation to the Indians to return and take possession of the missions if they did not want them sold. These proclamations were posted up in the pueblos for months before the sales. In 1844, the Indians of Dolores, Soledad, San Miguel, La Purissima, and San Rafael* were thus summoned to come back to their missions—a curious bit of half conscience-stricken, half politic recognition of the Indians' ownership of the lands, the act of the Departmental Assembly saying that if they (the Indians) did not return before such a date, the Government would declare said missions to be "without owners," and dispose of them accordingly. There must have been much bitter speech in those days when news of these proclamations reached the wilds where the mission Indians had taken refuge.

At last, in March, 1846, an act of the Departmental Assembly made the missions liable to the laws of bankruptcy, and authorized the governor to sell them to private persons. As by this time all the missions that had any pretense of existence left had been run hopelessly into debt, proceedings in regard to them were much simplified by this act. In the same year, the President of Mexico issued an order to Governor Pico to use all means within his power to raise money to defend the country against the United States; and under color of this double authorization the governor forthwith proceeded to sell missions right and left. He sold them at illegal private sales; he sold them for insignificant sums, and for sums not paid at all; whether he was, to use the words of a well-known legal

* The missions of San Rafael and San Francisco de Solano were the last founded; the first in 1819, and the latter in 1823—too late to attain any great success or importance.

CHURCH AND GRAVE-YARD OF SAN LUIS REY.

brief in one of the celebrated California land cases, "willfully ignorant or grossly corrupt" there is no knowing, and it made no difference in the result.

One of the last acts of the Departmental Assembly, before the surrender of the country, was to declare all Governor Pico's sales of mission property null and void. And one of Governor Pico's last acts was, as soon as he had made up his mind to run away out of the country, to write to some of his special friends and ask them if there were anything else they would like to have him give them before his departure.

On the 7th of July, 1846, the American flag was raised in Monterey, and formal possession of California was taken by the United States. The proclamation of Admiral Sloat, on this memorable occasion, included these words: "All persons holding title to real estate, or in quiet possession of lands under color of right, shall have those titles and rights guaranteed to them." "Color of right" is a legal phrase, embodying a moral idea, an obligation of equity. If the United States Government had kept this guarantee, there would be living in comfortable homesteads in California to-day many hundreds of people that are now homeless and beggared — Mexicans as well as Indians.

The army officers in charge of different posts in California, in these first days of the United States' occupation of the country, were perplexed and embarrassed by nothing so much as by the confusion existing in regard to the mission properties and lands. Everywhere men turned up with bills of sale from Governor Pico. At the San Diego Mission, the

A GLIMPSE OF THE BULL RING, SAN JUAN.

ostensible owner, one Estudillo by name, confessed frankly that he "did not think it right to dispose of the Indians' property in that way, but, as everybody was buying missions, he thought he might as well have one."

In many of the missions, squatters, without show or semblance of title, were found; these the officers turned out. Finally, General Kearney, to save the trouble of cutting any more Gordian knots, declared that all titles of missions and mission lands must be held in abeyance till the United States Government should pronounce on them.

For several years the question remained unsettled, and the mission properties were held by those who had them in possession at the time of the surrender. But in 1856 the United States Land Commission gave, in reply to a claim and petition from the Catholic Bishop of California, a decision, which, considered with reference to the situation of the mission properties at the time of the United States possession, was perhaps as near to being equitable as the circumstances would admit. But, considered with reference to the status of the mission establishments under the Spanish rule, to their original extent, the scope of the work, and the magnificent success of their experiment up to the time of the revolutions, it seems a sadly inadequate return of property once rightfully held; still, it was not the province of the United States to repair the injustices or make good the thefts of Spain and Mexico; and any attempt to clear up the tangle of confiscations, debts, frauds, and robberies in California, for the last quarter of a century before the surrender, would have been bootless work.

KITCHEN CHIMNEY, SAN JUAN.

The Land Commissioner's decision was based on the old Spanish law which divided church property into two classes, sacred and ecclesiastical, and held it to be inalienable,

OLD DOOR AND CORRIDOR ARCHES, SAN JUAN.

except in case of necessity, and then only according to provisions of canon law; in the legal term, it was said to be "out of commerce." The sacred property was that which had been in a formal manner consecrated to God—church buildings, sacred vessels, vestments, etc. Ecclesiastical property was land held by the Church, and appropriated to the maintenance of divine worship, or the support of the ministry; buildings occupied by the priests, or necessary for their convenience; gardens, etc. Following a similar division, the property of the mission establishments was held by the Land Commission to be of two sorts—mission property, and church property: the mission property, embracing the great tracts of land formerly cultivated for the community's purpose, it was decided, must be considered as government property; the church property, including with the church buildings, houses of priests, etc., such smaller portions of land as were devoted to the im-

mediate needs of the ministry, it was decided must still rightfully go to the Church. How many acres of the old gardens, orchards, vineyards, of the missions, could properly be claimed by the Church under this head, was of course a question; and it seems to have been decided on very different bases in different missions, as some received much more than others. But all the church buildings, priests' houses, and some acres of land, more or less, with each, were pronounced by this decision to have been "before the treaty of Guadalupe Hidalgo solemnly dedicated to the use of the Church, and therefore withdrawn from commerce"; "such an interest is protected by the provisions of the treaty, and must be held inviolate under our laws." Thus were returned at last, into the inalienable possession of the Catholic Church, all that were left of the old mission churches, and some fragments of the mission lands. Many of them are still in operation as curacies; others are in ruins; of some, not a trace is left—not even a stone.

At San Diego, the walls of the old church are still standing, unroofed, and crumbling daily. It was used as a cavalry barracks during the war of 1846; and has been a sheepfold since. Opposite it is an olive orchard, of superb hoary trees still in bearing: a cactus wall twenty feet high, and a cluster of date palms, are all that remain of the friars' garden.

At San Juan Capistrano, the next mission to the north, some parts of the buildings are still habitable. Service is held regularly in one of the small chapels. The priest lives there, and ekes out his little income by renting some of the moldering rooms. The church is a splendid ruin. It was of stone, a hundred and fifty feet long by a hundred in width, with walls five feet thick, a dome eighty feet high, and a fine belfry of arches in which four bells rang. It was thrown down by an earthquake in 1812, on the day

OLD PADRE'S CHAIR AT SAN JUAN.

INDIAN WORK AT SAN JUAN.

of the Feast of the Immaculate Conception. Morning mass was going on, and the church was thronged; thirty persons were killed and many more injured.

The little hamlet of San Juan Capistrano lies in harbor, as it were, looking out on its glimpse of sea, between two low spurs of broken and rolling hills, which in June are covered with shining yellow and blue, and green, iridescent as a peacock's neck. It is worth going across the continent to come into the village at sunset, of a June day. The peace, silence, and beauty of the spot are brooded over and dominated by the grand gray ruin, lifting the whole scene into an ineffable harmony. Wandering in room after room, court after court, through corridors with red-tiled roofs and hundreds of broad Roman arches, over fallen pillars, and through carved door-ways, whose untrodden thresholds have sunk out of sight in summer grasses, one asks himself if he be indeed in America. On the interior walls are still to be seen spaces of brilliant fresco-work, in Byzantine patterns of superb red, pale green, gray and blue; and the corridors are paved with tiles, large and square. It was

SAN JUAN BAUTISTA.

our good fortune to have with us, in San Juan Capistrano, a white-haired Mexican, who in his boyhood had spent a year in the mission. He remembered as if it were yesterday its bustling life of fifty years ago, when the arched corridor ran unbroken around the great court-yard, three hundred feet square, and was often filled with Indians, friars, officers, and gay Mexican ladies looking on at a bull-fight in the center. He remembered the splendid library, filled from ceiling to floor with books, extending one whole side of the square: in a corner, where had been the room in which he used to see sixty Indian women weaving at looms, we stood ankle-deep in furzy weeds and grass. He showed us the door-way, now closed up, which led into the friars' parlor. To this door, every Sunday, after mass, came the Indians, in long processions, to get their weekly gifts. Each one received something, a handkerchief, dress, trinket, or money. While their gifts were being distributed, a band of ten or twelve performers, all Indians, played lively airs on brass and stringed instruments. In a little baptistry, dusky with cobweb and mold, we found huddled a group of wooden statues of saints, which once stood in niches in the church: on their heads were faded and brittle wreaths, left from the last occasion on which they had done duty. One had lost an eye; another a hand. The gilding and covering of their robes were dimmed and defaced. But they had a dignity which nothing could destroy. The contours were singularly expressive and fine, and the rendering of the drapery was indeed wonderful — flowing robes, and gathered and lifted mantles, all carved in solid wood.

There are statues of this sort to be seen in several of the old mission churches. They were all carved by the Indians, many of whom showed great talent in that direction. There is also in the office of the justice or alcalde, as he is still called, of San Juan Capistrano, a carved chair of noticeably bold and graceful design made by Indian workmen. A few tatters of heavy crimson brocade hang on it still, relics of the time when it formed part of a gorgeous paraphernalia and service.

Even finer than the ruins of San Juan Capistrano are those of the church at San Luis Rey. It has a perfectly proportioned dome over the chancel, and beautiful groined arches on either hand and over the altar. Four broad pilasters on each side of the church are frescoed in a curious mixing of blues, light and dark, with reds and black, which have faded

AT SANTA BARBARA MISSION.

and blended into a delicious tone. A Byzantine pulpit hanging high on the wall, and three old wooden statues in niches, are the only decorations left. Piles of dirt and rubbish fill the space in front of the altar, and grass and weeds are growing in the corners; great flocks of wild doves live in the roof, and have made the whole place unclean and foul-aired. An old Mexican, eighty years old, a former servant of the mission, has the ruin in charge, and keeps the doors locked still, as if there were treasure to guard. The old man is called "alcalde" by the village people, and seems pleased to be so addressed. His face is like wrinkled parchment, and he walks bent into a parenthesis, but his eyes are bright and young. As he totters along, literally holding his rags together, discoursing warmly of the splendors he recollects, he seems indeed a ghost from the old times.

The most desolate ruin of all is that of the La Purisima mission. It is in the Lompoc valley, two days' easy journey north of Santa Barbara. Nothing is left there but one long, low adobe building, with a few arches of the corridor; the doors stand open, the roof is falling in: it has been so often used as a stable and sheep-fold, that even the grasses are killed around it. The painted pulpit hangs half falling on the wall, its stairs are gone, and its sounding-board is slanting awry. Inside the broken altar-rail is a pile of stones, earth, and rubbish, thrown up by seekers after buried treasures; in the farther corner another pile and hole, the home of a badger; mud-swallows' nests are thick on the cornice, and cobwebbed rags of the old canvas ceiling hang fluttering overhead. The only trace of the ancient cultivation is a pear-orchard a few rods off, which must have been a splendid sight in its day; it is at least two hundred yards square, with a double row of trees all around, so placed as to leave between them a walk fifty or sixty feet wide. Bits of broken aqueduct here and there, and a large, round stone tank overgrown by grass, showed where the life of the orchard used to flow in; it has been many years slowly dying of thirst. Many of the trees are gone, and those that remain stretch out gaunt and shriveled boughs, which, though still bearing fruit, look like arms tossing in vain reproach and entreaty; a few pinched little blossoms seemed to heighten rather than lessen their melancholy look.

At San Juan Bautista there lingers more of the atmosphere of the olden time than is to be found in any other place in California. The mission church is well preserved; its grounds are inclosed and cared for; in its garden are still blooming roses and vines, in the shelter of palms, and with the old stone sun-dial to tell time. In the sacristy are oak chests, full of gorgeous vestments of brocades, with silver and gold laces. On one of these robes is an interesting relic. A lost or worn-out silken tassel had been replaced by the patient Indian workers with one of fine-shredded rawhide; the shreds wound with silver wire, and twisted into tiny rosettes and loops, closely imitating

THE OLD ALCALDE, SAN LUIS REY.

the silver device. The church fronts south, on a little green-locust walled plaza — the sleepiest, sunniest, dreamiest place in the world. To the east the land falls off abruptly, so that the paling on that side of the plaza is outlined against the sky, and its little locked gate looks as if it would open into the heavens. The mission buildings used to surround this plaza; after the friars' day came rich men living there; and a charming inn is kept now in one of their old adobe houses. On the east side of the church is a succession of three terraces leading down to a valley. On the upper one is the old grave-yard, in which it is said there are sleeping four thousand Indians.

In 1825 there were spoken at this mission thirteen different Indian dialects.

Just behind the church is an orphan girls' school, kept by the Sisters of the Sacred Heart. At six o'clock every morning the bells of the church ring for mass as they used to ring when over a thousand Indians flocked at the summons. To-day, at the sound, there comes a procession of little girls and young maidens, the black-robed sisters walking before them with crossed hands and placid faces. One or two Mexican women, with shawls over their heads, steal across the faint paths of the plaza, and enter the church.

I shall always recollect the morning when I went, too. The silence of the plaza was in itself a memorial service, with locust blossoms swinging incense. It was barely dawn in the church. As the shrill yet sweet childish voices lifted up the strains of the Kyrie Eleison, I seemed to see the face of Father Junipero in the dim lighted chancel, and the benediction was as solemn as if he himself had spoken it. Why the little town of San Juan Bautista continues to exist is a marvel. It is shut out and cut off from everything; only two or three hundred souls are left in it; its streets are grass-grown; half its houses are empty. But

it has a charm of sun, valley, hill, and seaward off-look unsurpassed in all California. Lingering out a peaceful century there are many old men and women, whose memories are like magic glasses, reproducing the pictures of the past. One such we found—a Mexican woman eighty-five years old, portly, jolly, keen-tongued, keen-eyed; the widow of one of the soldiers of the old mission guard. She had had twelve children; she had never been ill a week in her life; she is now the village nurse, and almost doctor. Sixty years back she remembered. "The Indians used to be in San Juan Bautista like sheep," she said, "by the thousand and thousand." They were always good, and the padres were always kind. Fifty oxen were killed for food every eight days, and everybody had all he wanted to eat. There was much more water then than now, plenty of rain, and the streams always full. "I don't know whether you or we were bad, that it has been taken away by God," she said, with a quick glance, half humorous, half antagonistic.

The Santa Barbara Mission is still in the charge of Franciscans, the only one remaining in their possession. It is now called a college for apostolic missionary work, and there are living within its walls eight members of the order. One of them is very old—a friar of the ancient régime; his benevolent face is well known throughout the country, and there are in many a town and remote hamlet men and women who wait always for his coming before they will make confession. He is like St. Francis's first followers: the obligations of poverty and charity still hold to him, the literal fullness of the original bond. He gives away garment after garment, leaving himself without protection against cold, and the brothers are forced to lock up and hide from him all provisions, or he would leave the house bare of food. He often kneels from midnight to dawn on the stone floor of the church, praying and chanting psalms, and when a terrible epidemic of small-pox broke out some years ago, he labored day and night, nursing the worst victims of it, shriving them, and burying them with his own hands. He is past eighty and has not much longer to stay. He has outlived many things beside his own prime: the day of the sort of faith and work to which his spirit is attuned has passed by forever.

The mission buildings stand on high ground, three miles from the beach, west of the town and above it, looking to the sea. In the morning the sun's first rays flash full on its front, and at evening they linger late on its western wall. It is an inalienable benediction to the place. The longer one stays there the more he is aware of the influence on his soul, as well as of the importance in the landscape of the benign and stately edifice.

On the corridor of the inner court hangs a bell which is rung for the hours of the daily offices and secular duties. It is also struck whenever a friar dies, to announce that all is over. It is the duty of the brother who has watched the last breath of the dying one to go immediately and strike this bell. Its sad note has echoed many times through the corridors.

One of the brothers said, last year:

"The first time I rang that bell to announce a death, there were fifteen of us left. Now there are only eight."

The sentence itself fell on my ear like the note of a passing bell. It seems a not unfitting last word to this slight and fragmentary sketch of the labors of the Franciscan Order in California.

Still more fitting, however, are the words of a historian, who, living in California and thoroughly knowing its history from first to last, has borne the following eloquent testimony to the friars and their work:

"The results of the mission scheme of Christianization and colonization were such as to justify the plans of the wise statesman who devised it and to gladden the hearts of the pious men who devoted their lives to its execution.

"At the end of sixty years, the missionaries of Upper California found themselves in the possession of twenty-one prosperous missions, planted on a line of about seven hundred miles, running from San Diego north to the latitude of Sonoma. More than thirty thousand Indian converts were lodged in the mission buildings, receiving religious culture, assisting at divine worship, and cheerfully performing their easy tasks. * * If we ask where are now the thirty thousand Christianized Indians who once enjoyed the beneficence and created the wealth of the twenty-one Catholic missions of California, and then contemplate the most wretched of all want of systems which has surrounded them under our own government, we shall not withhold our admiration from those good and devoted men who, with such wisdom, sagacity, and self-sacrifice, reared these wonderful institutions in the wilderness of California. They at least would have preserved these Indian races if they had been left to pursue unmolested their work of pious beneficence."—JOHN W. DWINELLE'S "Colonial History of San Francisco," pp. 44–87.

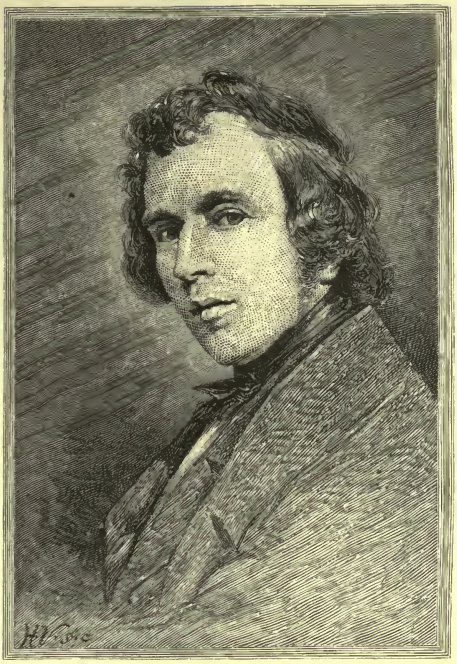
H. H.

JOHN KEATS IN HIS LAST ILLNESS.

FROM THE SKETCH BY JOSEPH SEVERN, JANUARY 28, 1821.*

God bless you, my dear
Brother & Sister. Your ever affectionate
Brother John Keats.

*Charles Cowden Clarke characterized this portrait as "a marvellously correct likeness."



Joseph Severn

ON SEVERN'S LAST SKETCH OF KEATS.

ANGEL of Sleep or Death! whom hast thou here,
With meek head droop'd, all haggard and outworn!
So looked Leander, to the startled morn,
Left by the tide on sands and rushes sere;
And so looked Hyacinth, to Phœbus dear,
As on the sward he lay, by envy shorn;
So looked Rome's martyr youth to burial borne
Within some delvéd cavern, chill and drear.

O fair death-sleeper! gazing on thee now,
Forgetting all thy years profound of rest
In peaceful barrow by the daisy drest,
We keep a vigil,—by thy pillow bow,
And listen, smiling through our tears when thou
Murm'rest of flowers that spring above thy breast.

Edith M. Thomas.

[Joseph Severn (whose sketch of the dying Keats is reproduced on the opposite page) died in the city of Rome, August 3, 1879, fifty-eight years after the death of his illustrious friend, and was buried by his side. The above portrait of Severn is from a drawing by himself, made in his youth, and both portraits are given here by the kind permission of Mr. Walter Severn, son of the artist. The Severn autograph was written in May, 1879.]

THE OLD LEVEE COTTON-PRESS.

THE GREAT SOUTH GATE.

BY GEORGE W. CABLE,

Author of "Old Creole Days," "The Grandissimes," etc.

I.

FAUBOURG STE. MARIE.

If one will stand to-day on the broad levee at New Orleans, with his back to the Mississippi, a short way out to the left and riverward from the spot where the long vanished little Fort St. Louis once made pretense of guarding the town's upper river corner, he will look down two streets at once. They are Canal and Common, which gently diverge from their starting-point at his feet and narrow away before his eye as they run down toward the low, unsettled lots and commons behind the city.

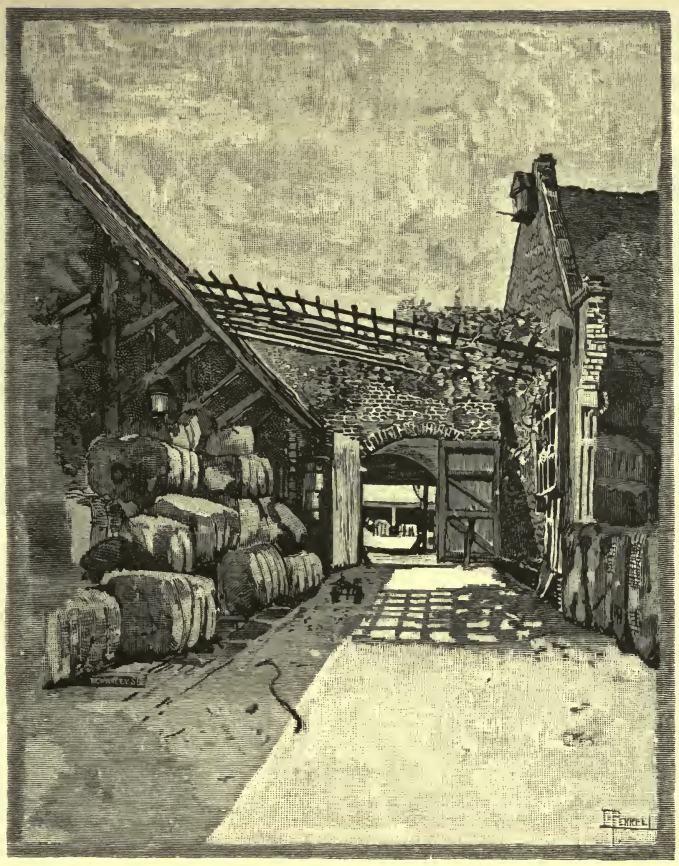
Canal street, the center and pride of New Orleans, takes its name from the slimy old moat that once festered under the palisade wall of the Spanish town, where it ran back from river to swamp and turned northward on the line now marked by the beautiful tree-planted Rampart street.

Common street marks the ancient boundary of the estates wrested from the exiled Jesuit fathers by confiscation. In the beginning of the present century, the long wedge-shaped tract between these two lines was a Government reservation, kept for the better efficiency of the fortifications that overlooked its lower border and for a public road to Noman's land. It was called the Terre Commune.

That part of the Jesuits' former plantations that lay next to the Terre Commune was mainly the property of a singular personage named Jean Gravier. Its farther side boundary was on a line now indicated by Delord street. When the fire of 1788 laid nearly the half of New Orleans in ashes, his father, Bertrand, and his mother, Marie, had laid off this tract into lots and streets, to the depth of three squares backward from the river, and called it Villa Gravier. On her death, the name was changed in her honor, and so became the Faubourg Ste. Marie.

Capitalists had smiled upon the adventure. Julian Poydras, Claude Girod, Julia, a free woman of color, and others had given names to its cross-streets by buying corner-lots on its river-front. Along this front, under the breezy levee, ran the sunny and dusty Tchoupitoulas road, entering the town's southern river-side gate, where a sentry-box and Spanish corporal's guard drowsed in the scant shadow of Fort St. Louis. Outside the levee the deep Mississippi glided, turbid, silent, often overbrimming, with many a swirl and upward heave of its boiling depths, and, turning, sent a long smooth eddy back along this "making bank," while its main current hurried onward, townward, *northward*, as if it would double on invisible pursuers before it swept to the east and south-east from the Place d'Armes and disappeared behind the low groves of Slaughterhouse Point.

In the opening years of the century only an occasional villa and an isolated roadside shop or two had arisen along the front of Faubourg Ste. Marie and in the first street behind. Calle del Almazen, the Spanish notary wrote this street's name, for its lower (northern) end looked across the Terre Commune upon the large Almazen or store-house of Kentucky tobacco which Don Estevan Mirò thought it



ENTRANCE TO A COTTON-YARD.

wise to keep filled with purchases from the perfidious Wilkinson. Rue du Magasin, the Creoles translated it, and the Americans made it Magazine street; but it was still only a straight road. Truck-gardens covered the fertile arpents between and beyond. Here and there was a grove of wide-spreading live-oaks, here and there a clump of persimmon trees, here and there an orchard of figs, here and there an avenue of bitter oranges or of towering pecans. The present site of the "St. Charles" was a cabbage-garden. Midway between Poydras and Girod streets, behind Magazine, lay a *campo de negroes*, a slave camp, probably of cargoes of Guinea slaves. The street that cut through it became Calle del Campo—Camp street.

Far back in the rear of these lands, on the old Poydras draining canal, long since filled up and built upon,—in a lonely, dreary waste of weeds and bushes dotted thick with cypress stumps and dwarf palmetto, full of rankling ponds choked with bulrushes, flags, and pickerel-weed, fringed by willows and reeds, and haunted by frogs, snakes, crawfish, rats, and mosquitoes, on the edge of the tangled swamp forest,—stood the dilapidated home of "Doctor" Gravier. It stood on high pillars. Its windows and doors were high and wide, its verandas were broad, its roof was steep, its chimneys were tall, and its occupant was a childless, wifeless, companionless old man, whose kindness and medical attention to negroes had won him his professional title. He claims mention as a type of that strange group of men which at this early period figured here as the shrewd acquirers of wide suburban tracts, leaders of lonely lives, and leavers of great fortunes.

John McDonough, who at this time was a young man, a thrifty trader in Guinea negroes, and a suitor for the hand of Don Andreas Almonaster's fair daughter, the late Baroness Pontalba, became in after days a like solitary type of the same class. Jean Gravier's house long survived him, a rendezvous for desperate characters, and, if rumor is correct, the scene of many a terrible murder.

In the favoring eddy under the river-bank in front of Faubourg Ste. Marie landed the flat-boat fleets from the Ohio, the Tennessee,

and the Cumberland. Buyers crowded here for cheap and fresh provisions. The huge, huddled arks became a floating market-place, with the kersey and woolsey and jeans clad bargemen there, and the Creole and his sometimes brightly clad and sometimes picturesquely ragged slave here, and the produce of the West changing hands between. But there was more than this. Warehouses began to appear on the edge of Tchoupitoulas road, and barrels of pork and flour and meal to run bickering down into their open doors from the levee's top. Any eye could see that, only let war cease, there would be a wonderful change in the half-drained, sun-baked marshes and kitchen-gardens of Faubourg St. Marie.

IN A COTTON YARD.

Presently the change came. It outran the official news of peace. "Our harbor," wrote Claiborne, the governor, in March, 1815, "is again whitening with canvas; the levee is crowded with cotton, tobacco, and other articles for exportation."

A full sunrise of prosperity shone upon New Orleans. The whole great valley above began to fill up with wonderful speed and to pour down into her lap the fruits of its agriculture. Thirty-three thousand people were astir in her homes and streets. They overran the old bounds. They pulled up the old palisade. They shoveled the earth-works into the moat and pushed their streets out into the fields and thickets. In the old narrow ways—and the wider new ones alike—halls, churches, schools, stores, warehouses, banks, hotels, and theaters sprang up by day and night.

Faubourg Ste. Marie outstripped all other quarters. The unconservative American was everywhere, but in Faubourg Ste. Marie he was supreme. The Western trade crowded down like a breaking up of ice. In 1817, 1500 flat-boats and 500 barges tied up to the willows of the levee before the new faubourg. Inflation set in. Exports ran up to thirteen million dollars' worth.

In 1819 came the collapse, but development overrode it. Large areas of the *batture* were reclaimed in front of the faubourg, and the Americans covered them with store buildings. In 1812, the first steam vessel had come down the Mississippi; in 1816, for the first time, one overcame and re-ascended its current; in 1821, 441 flat-boats and 174 barges came to port, and there were 287 arrivals of steam-boats.

The kitchen-gardens vanished. Gravier street, between Tchoupitoulas and Magazine, was paved with cobble-stones. The Creoles laughed outright. "A stone pavement in New Orleans soil? It would sink out of sight!" But it bore not only their ridicule, but an uproar and gorge of wagons and drays. There was an avalanche of trade. It crammed the whole harbor-front—old town and new—with river and ocean fleets. It choked

the streets. The cry was for room and facilities. The Creoles heeded it. Up came their wooden sidewalks and curbs, brick and stone went down in their place, and by 1822 gangs of street paviors were seen and heard here, there, and yonder, swinging the pick and ramming the roundstone. There were then 41,000 people in the town and its suburbs.

The old population held its breath. It clung bravely to the failing trades of the West Indies, France, and Spain. Coffee, indigo, sugar, rice, and foreign fruits and wines were still handled in the Rues Toulouse, Conti, St. Louis, Chartres, St. Peter, and Royale; but the lion's share — the cotton, the tobacco, pork, beef, corn, flour, and northern and British fabrics — poured into and out of Faubourg Ste. Marie through the hands of the swarming Americans.

"New Orleans is going to be a mighty city," said they in effect, "and we are going to be New Orleans." But the Creole was still powerful, and jealous of everything that hinted of American absorption. He had, in 1816, elected one of his own race, General Villeré, to succeed Claiborne in the governor's chair, and to guard the rights that headlong Americans might forget. "Indeed," this governor wrote in a special message on the "scandalous practices almost every instant taking place in New Orleans and its suburbs"—"Indeed, we should be cautious in receiving all foreigners." That caution was, however, of little avail.

II.

A HUNDRED THOUSAND PEOPLE.

WHAT a change! The same Governor Villeré could not but say, "The Louisianian who retraces the condition of his country under the government of kings can never cease to bless the day when the great American confederation received him into its bosom." It was easy for Louisianians to be Americans; but to let Americans be Louisianians! — there was the rub. Yet it had to be. In ten years, the simple export and import trade of the port had increased fourfold; and in the face of inundations and pestilences, discord of sentiment and tongues, and the saddest of public morals and disorder, the population had nearly doubled.

Nothing could stop the inflow of people and wealth. In the next ten years, 1820–30, trade increased to one-and-three-quarters its already astonishing volume. The inhabitants were nearly 50,000, and the strangers from all parts of America and the commercial world were a small army. Sometimes there would be five or six thousand up-river bargemen in town at once, wild, restless, and unemployed. On the levee especially this new tremendous life and energy heaved and palpitated. Between 1831 and 1835, the mere foreign exports and imports ran up from twenty-six to nearly fifty-four million dollars. There were no wharves built out into the harbor yet, and all the vast mass of produce and goods lay out under the open sky on the long, wide, unbroken level of the curving harbor-front, where Ohio bargemen, Germans, Mississippi raftsmen, Irishmen, French, English, Creoles, Yankees, and negro and mulatto slaves surged and jostled and filled the air with shouts and imprecations.

Vice put on the same activity that commerce showed. The Creole had never been a strong moral force. The American came in as to gold diggings or diamond fields, to grab and run. The transatlantic immigrant of those days was the offscouring of Europe. The West Indian was a leader in licentiousness, gambling, and dueling. The number of billiard-rooms, gaming-houses, and lottery-offices was immense. In the old town they seemed to be every second house. There was the French Evangelical Church Lottery, the Baton Rouge Church Lottery, the Natchitoches Catholic Church Lottery, and a host of others less piously inclined. The cafés of the central town were full of filibusters. In 1819, "General" Long sailed hence against Galveston. In 1822, a hundred and fifty men left New Orleans in the sloop-of-war *Eureka*, and assisted in the taking of Porto Cabello, Venezuela, etc., etc. The paving movement had been only a flurry or two, and even in the heart of the town, where carriages sometimes sank to their axles in mud, highway robbery and murder lay always in wait for the incautious night wayfarer who ventured out alone. The police was a mounted *gendarmerie*. If the Legislature committed a tenth of the wickedness it was charged with, it was sadly corrupt. The worst day of all the week was Sunday. The stores and shops were open, but toil slackened and license gained headway. Gambling-rooms and ball-rooms were full, weapons were often out, the masques of the Salle de Condé were thronged with men of high standing, and crowds of barge and raftsmen, as well as Creoles and St. Domingans, gathered at those open-air African dances, carousals, and debaucheries in the rear of the town that have left their monument in the name of "Congo" Square.

Yet still prosperity smiled and commerce roared along the streets of the town and her faubourgs — Ste. Marie on her right, Marigny on her left — with ever-rising volume and value, and in spite of fearful drawbacks. The climate was deadly to Americans, and more deadly to the squalid immigrant. Social life, unattractive at best, received the Creole and shut the door. The town was without beauty,

and the landscape almost without a dry foothold. Schools were scarce and poor, churches few and ill attended, and domestic service squalid, inefficient, and corrupt. Between 1810 and 1837 there were fifteen epidemics of yellow fever. Small-pox was frequent. In 1832, while yellow fever was still epidemic, cholera entered and carried off one person in every six; many of the dead were buried where they died, and many were thrown into the river. Moreover, to get to the town or to leave it was a journey famed for its dangers. On one steam-boat, three hundred lives were lost; on another, one hundred and thirty; on another, the same number; on another, one hundred and twenty. The cost of running a steamer was six times as great as on the northern lakes.

Without these drawbacks what would New Orleans have been? For, with them all, and with others which we pass by, her population between 1830 and 1840 once more doubled its numbers. She was the fourth city of the United States in the number of her people. Cincinnati, which in the previous decade had outgrown her, was surpassed and distanced. Only New York, Philadelphia, and Baltimore were larger. Boston was nearly as large; but besides these there was no other city in the Union of half her numbers. Faubourg Ste. Marie had swallowed up the suburbs above her until it comprised the whole expanse of the old Jesuits' plantations to the line of Felicity road. The old Marquis Marigny de Mandeville, whose plantation lay on the lower edge of the town just across the Esplanade, had turned it into lots and streets, and the town had run over upon it and covered it with small residences, and here and there a villa. The city boundaries had been extended to take in both these faubourgs; and the three "municipalities," as they were called, together numbered one hundred and two thousand inhabitants.

The ends of the harbor-front were losing sight of each other. In the seasons of high water the tall, broad, frail-looking steamers that crowded in together, "bow on," at the busy levee, hidden to their hurricane roofs in cargoes of cotton bales, looked down upon not merely a quiet little Spanish-American town of narrow streets, low, heavy, rugged roofs, and Latin richness and variety of color peeping out of a mass of overshadowing greenery. Fort St. Charles, the last fraction of the old fortifications, was gone, and the lofty chimney of a United States mint smoked in its place. The new Bourse, later known as St. Louis Hotel, and yet later as the famed State-house of Reconstruction days, just raised its low, black dome into view above the intervening piles of brick. A huge prison lifted its frowning walls and quaint Spanish twin belfries gloomily over Congo Square. At the white stuccoed Merchants' Exchange, just inside the old boundary on the Canal street side, a stream of men poured in and out, for there was the post-office. Down in the lower arm of the river's bend shone the Third Municipality, —that had been Faubourg Marigny. On its front, behind a net-work of shipping, stood the Levee Cotton Press, which had cost half a million dollars. Here on the south, sweeping far around and beyond the view almost to the "Bull's Head Coffee-house," was the Second Municipality, once Faubourg Ste. Marie, with its lines and lines of warehouses, its Orleans Press, that must needs cost a quarter million more than the other, and many a lesser one. The town was full of banks: the Commercial, the Atchafalaya, the Orleans, the Canal, the City, etc. Banks's Arcade was there, a glass-roofed mercantile court in the midst of a large hotel in Magazine street, now long known as the St. James. Hotels were numerous. In Camp and St. Charles streets stood two theaters where the world's stars deigned to present themselves, and the practical jokers of the upper galleries concocted sham fights and threw straw men over into the pit below, with cries of murder. Here and there a church—the First Presbyterian, the Carondelet Methodist —raised an admonitory finger. The site of old Jean Gravier's house was hidden behind Poydras Market; the uncanny iron frames of the Gas Works rose beyond. The reservoir of the water-works lay in here to the left near the river, whose muddy water it used. Back yonder in the street named for Julia, the f. w. c.,* a little bunch of schooner masts and pennons showed where the Canal Bank had dug a "New Basin" and brought the waters of Lake Pontchartrain up into this part of the city also.

It was the period when the American idea of architecture had passed from its untrained innocence to a sophomoric affectation of Greek forms. Banks, hotels, churches, theaters, mansions, cottages, all were Ionic or Corinthian, and the whole American quarter was a gleaming white. The commercial shadow of this quarter fell darkly upon the First Municipality, the old town. A quiet crept into the Rue Toulouse. The fashionable shops on the Rue Royale slipped away and spread out in Canal street. The vault of the St. Louis dome still echoed the voice of the double-tongued French-English auctioneer of town lots and slaves; but in the cabbage-garden of "old Mr. Percy," in the heart of Faubourg Ste. Marie, a resplendent rival, the palatial S.

* Free woman of color.

Charles, lifted its dazzling cupola high above all surroundings and overpeered old town and new, river, plain, and receding forest. Its rotunda was the unofficial guildhall of all the city's most active elements. Here met the capitalist, the real estate operator, the merchant, the soldier, the tourist, the politician, the filibuster, the convivialist, the steam-boat captain, the horse-fancier; and ever conspicuous among the throng—which had a trick of separating suddenly and dodging behind the pillars of the rotunda at the sound of high words—was a man, a type, an index of great wealth to New Orleans, who in this spot was never a stranger and was never quite at home.

III.

FLUSH TIMES.

THE brow and cheek of this man were darkened by outdoor exposure, but they were not weather-beaten. His shapely, bronzed hand was no harder or rougher than was due to the use of the bridle-rein and the gunstock. His eye was the eye of a steed; his neck—the same. His hair was a little luxuriant. His speech was positive, his manner was military, his sentiments were antique, his clothing was of broadcloth, his boots were neat, and his hat was soft, broad, and slouched a little to show its fineness. Such in his best aspect was the Mississippi River planter. When sugar was his crop and Creole French his native tongue, his polish would sometimes be finer still, with a finish got in Paris, and his hotel would be the St. Louis.

He was growing to be a great power. The enormous agricultural resources of Louisiana, Mississippi, Arkansas, and Tennessee were his. The money-lender gyrated around him with sweet smiles and open purse. He was mortgaged to the eyes, and still commanded a credit that courted and importuned him. He caused an immense increase of trade. His extravagant wants and the needs of his armies of slaves kept the city drained of its capital almost or quite the whole year round. Borrower and lender vied with each other in recklessness. Much the larger portion of all the varied products of the West received in New Orleans was reshipped, not to sea, but to the plantations of the interior, often returning along the same route half the distance they had originally come. Millions of capital that would have yielded slower but immensely better final results in other channels went into the planters' paper, based on the value of slaves and of lands whose value depended on slave labor,—a species of wealth unexchangeable in the great world of commerce, fictitious as paper money, and even more illusory. But, like the paper money that was then inundating the country, this system produced an immense volume of business; and this, in turn, called into the city to fill the streets and landings and the thousands of humble dwellings that sprang up throughout the old Faubourg Marigny and spread out on the right flank of Faubourg Ste. Marie, the Irish and German emigrant, by tens of thousands.

It was in the midst of these conditions that mad speculations in Western lands and the downfall of the United States Bank rolled the great financial crisis of 1837 across the continent. Where large results had intoxicated enterprise, banks without number and often without foundation strewed their notes among the infatuated people. But in New Orleans enterprise had forgotten everything but the factorage of the staple crops. The banks were not so many, but they followed the fashion in having make-believe capital and in their crumbling to ashes at a touch. Sixty millions capital, four of deposits, twelve hundred thousand specie, eighteen hundred thousand real estate, and seventy-two millions receivables, mostly protested,—such was their record when they suspended.

"A whirlwind of ruin," said one of the newspapers, "prostrated the greater portion of the city." Everybody's hands were full of "shin-plasters." There was no other currency. Banks and banking were execrated, and their true office so ill understood that a law passed preventing the establishment of any such institution in the State. A few old banks that weathered the long financial stress accepted, with silent modesty, the monopoly thus thrown into their hands, and in 1843, having abandoned the weaker concerns to shipwreck, resumed specie payment. The city's foreign commerce had dropped to thirty-four and three-quarters million dollars, a loss of nineteen millions; but, for the first time in her history, she sent to sea a million bales of cotton.

The crisis had set only a momentary check upon agriculture. The financiers of New Orleans came out of it more than ever infatuated with the plantation idea. It had become the ruling principle in the social organism of the South, the one tremendous drawback to the best development of country and city; and now the whole lower Mississippi valley threw all its energies and all its fortune into this seductive mistake.

And still the city grew; grew as the delta sands on which it stands had grown, by the compulsory tribute of the Mississippi. The great staples of the valley poured down ever more and more. In 1842, the value of these receipts was $45,700,000; in 1844, it was $60,000,000; in 1846, it was over $77,000,-

000; in 1847, it was $90,000,000; in 1850, it was close to $97,000,000. The city lengthened; it broadened; it lifted its head higher. The trowel rang everywhere on home-made brick and imported granite, and houses rose by hundreds. The Irish and Germans thronged down from the decks of emigrant ships at the rate of thirty thousand a year. They even partly crowded out slave service. In 1850, there were 5330 slaves less in the city than in 1840. The free mulatto also gave way. Unenterprising, despised, persecuted, this caste, once so scant in numbers, had grown, in 1840, to be nearly as numerous as the whites. The "abolition" question brought them double hatred and suspicion; and restrictive, unjust, and intolerant State legislation reduced their numbers—it must have been by exodus—from 19,000 to less than 10,000 souls. Allowing for natural increase, eleven or twelve thousand must have left the city. The proportion of whites rose from fifty-eight to seventy-eight per cent., and the whole population of New Orleans and its environs was 133,650.

Another city had sprung up on the city's upper boundary. In 1833, three suburbs, Lafayette, Livaudais, and Réligeuses, the last occupying an old plantation of the Ursuline nuns, combined into a town. About 1840, the wealthy Americans began to move up here into "large, commodious, one-story houses, full of windows on all sides, and surrounded by broad and shady gardens." Here, but nearer the river, Germans and Irish—especially the former—filed in continually, and by 1850 the town of Lafayette contained over fourteen thousand residents, nearly all white.

It was a red-letter year. The first street pavement of square granite blocks was laid. Wharf building set in strongly. The wires of the electro-magnetic telegraph drew the city into closer connection with civilization. The mind of the financier was aroused, and he turned his eye toward railroads. The "Tehuantepec route" received its first decided impulse. Mexican grants were bought; surveys were procured; much effort was made—and lost. The Mexican Government was too unstable and too fickle to be bargained with. But in 1851, meantime, two great improvements were actually set on foot; to wit, the two railways that now unite the city with the great central system of the Union in the Mississippi-Ohio valley, and with the vast Southwest, Mexico, and California. These two works moved slowly, but by 1855 and 1857 the railway trains were skimming out across the flowery *prairies tremblantes* eighty miles westward toward Texas, and the same distance northward toward the center of the continent. In 1852, Lafayette and the municipalities were consolidated into one city government. Sixteen years of subdivision under separate municipal councils, and similar expensive and obstructive nonsense, had taught Creole, American, and immigrant the value of unity and of the American principles of growth better than unity could have done it. Algiers, a suburb of machine shops and nautical repair yards, began to grow conspicuous on the farther side of the river.

The consolidation was a great step. The American quarter became the center and core of the whole city. Its new and excessively classic marble municipality hall became the city hall. Its public grounds became the chosen rendezvous of all popular assemblies. All the great trades sought domicile in its streets; and the St. Charles, at whose memorable burning in 1850 the people wept, being restored in 1852–53, made final eclipse of the old St. Louis.

A small steel-engraved picture of New Orleans, made just before this period, is obviously the inspiration of the commercial and self-important American. The ancient plaza, the cathedral, the old hall of the cabildo, the calaboza, the old Spanish barracks, the emptied convent of the Ursulines, the antiquated and decayed Rue Toulouse, the still quietly busy Chartres and Old Levee streets—all that was time honored and venerable are pushed out of view, and the lately humble Faubourg Ste. Marie fills the picture almost from side to side. Long ranks of huge, lofty-chimneyed Mississippi steamers smoke at the levee; and high above the deep and solid phalanxes of brick and stone rise the majestic dome of the first St. Charles and the stately tower of St. Patrick's Church, queen and bishop of the board.

But the ancient landmarks trembled to a worse fate than being left out of a picture. Renovation came in. In 1850, the cathedral was torn down to its foundations, and began to rise again with all of its Spanish picturesqueness lost and little or nothing gained in beauty. On its right and left absurd French roofs were clapped upon the cabildo and the court-house. The Baroness Pontalba replaced the quaint old tile-roofed store buildings that her father had built on either side of the square with large, new rows of red brick. The city laid out the Place d'Armes, once her grassy play-ground, in blinding white-shell walks, trimmed shrubbery, and dusty flower-beds, and later, in 1855, placed in its center the bronze equestrian figure of the deliverer of New Orleans, and called the classic spot Jackson Square. Yet, even so, it remains to the present the last lurking-place of the romance of primitive New Orleans.

It was not a time to look for very good taste All thoughts were led away by th golden charms of commerce. In 1851, the value of receipts from the interior was nearly $107,000,000. The mint coined $10,000,000, mostly the product of California's new-found treasure-fields. The year 1853 brought still greater increase. Of cotton alone, there came sixty-eight and a quarter million dollars' worth. The sugar crop was tens of thousands of hogsheads larger than ever before. Over a tenth of all the arrivals from sea were of steam-ships. There was another inflation. Leaving out the immense unascertained amounts of shipments *into* the interior, the city's business, in 1856, rose to two hundred and seventy-one and a quarter millions. In 1857 it was three hundred and two millions. In this year came a crash, which the whole country felt. New Orleans felt it rather less than other cities, and quickly recovered.

We pause at 1860. In that year New Orleans rose to the proudest commercial exaltation she has ever enjoyed, and at its close began that sudden and swift descent which is not the least pathetic episode of our unfortunate civil war. In that year, the city that one hundred and forty years before had consisted of one hundred bark and palmetto-thatched huts in a noisome swamp counted, as the fraction of its commerce comprised in its exports, imports, and domestic receipts, the value of three hundred and twenty-four million dollars.

IV.

WHY NOT BIGGER THAN LONDON.

THE great Creole city's geographical position has always dazzled every eye except the cold, coy scrutiny of capital. "The position of New Orleans," said President Jefferson in 1804, "certainly destines it to be the greatest city the world has ever seen." He excepted neither Rome nor Babylon. But man's most positive predictions are based upon contingencies; one unseen victory over nature bowls them down; the seeming certainties of to-morrow are changed to the opposite certainties of to-day; deserts become gardens, gardens cities, and older cities the haunts of bats and foxes.

When the early Kentuckian and Ohioan accepted nature's highway to market, and proposed the conquest of New Orleans in order to lay that highway open, they honestly believed there was no other possible outlet to the commercial world. When steam navigation came, they hailed it with joy and without question. To them it seemed an ultimate result. To the real-estate hoarding Creole, to the American merchant who was crowding and chafing him, to every superficial eye at least, it seemed a pledge of unlimited commercial empire bestowed by the laws of gravitation. Few saw in it the stepping-stone from the old system of commerce by natural highways to a new system by direct and artificial lines.

It is hard to understand, looking back from the present, how so extravagant a mistake could have been made by wise minds. From the first — or perhaps, we should say, from the peace of 1815 — the development of the West declined to wait on New Orleans, or even on steam. In 1825, the new principle of commercial transportation — that despises alike the aid and the interference of nature — opened, at Buffalo, the western end of the Erie Canal, the gate-way of a new freight route to northern Atlantic tide-waters, many hundreds of leagues more direct than the long journey down the Mississippi to New Orleans and around the dangerous capes of Florida. In the same year another canal was begun, and in 1832 it connected the Ohio with Lake Erie; so that, in 1835, the State of Ohio alone sent through Buffalo to Atlantic ports 86,000 barrels of flour, 98,000 bushels of wheat, and 2,500,000 staves.

Another outlet was found, better than all transits — manufactures. Steam, driving all manner of machinery, built towns and cities. Cincinnati had, in 1820, 32,000 inhabitants; in 1830, 52,000. Pittsburg became, "in the extent of its manufactures, the only rival of Cincinnati in the West." St. Louis, still in embryo, rose from 10,000 to 14,000. Buffalo, a town of 2100, quadrupled its numbers.

Meanwhile far down in New Orleans the Creole, grimly, and the American, more boastfully, rejoiced in a blaze of prosperity that blinded both. How should they, in a rain of wealth, take note that, to keep pace with the wonderful development in the great valley above, their increase should have been three times as great as it was, and that the sun of illimitable empire, which had promised to shine brightest upon them, was shedding brighter promises and kinder rays eastward, and even northward, *across* nature's highways and barriers. Even steam navigation began, on the great lakes, to demonstrate that the golden tolls of the Mississippi were not all to be collected at one or even two gates.

How might this have been stopped? By no means. The moment East and West saw that straighter courses toward commercial Europe could be taken than wild nature offered, the direct became the natural route, and the circuitous the unnatural. East-and-west trade lines meant, sooner or later, the commercial subordination of New Orleans, until such time as the growth of countries be-

hind her in the South-west should bring her also upon an east-and-west line. Meantime the new system could be delayed by improving the old, many of whose drawbacks were removable. That which could not be stopped could yet be postponed.

But there was one drawback which riveted all the rest. Through slave-holding, and the easy fortune-getting it afforded, an intellectual indolence spread everywhere, and the merchant of Faubourg Ste. Marie, American—often New Englander—as he was, sank under the seductions of a livelihood so simple, so purely executive, and so rich in perquisites, as the marketing of raw crops. From this mental inertia sprang an invincible provincialism; the Creole, whose society he was always courting, intensified it. Better civilizations were too far away to disturb it. A "peculiar institution" doubled that remoteness, and an enervating, luxurious climate folded it again upon itself. It colored his financial convictions and all his conduct of public affairs. He confronted obstacles with serene apathy; boasted of his city's natural advantages, forgetting that it was man, not nature, that he had to contend with; surrendered ground which he might have held for generations; and smilingly ignored the fact that, with all her increase of wealth and population, his town was slipping back along the comparative scale of American cities. "Was she not the greatest in exports after New York?"

The same influence that made the Creole always and only a sugar, tobacco, or cotton factor, waived away the classes which might have brought in manufactures with them. Its shadow fell as a blight upon intelligent, trained labor. Immigrants from the British isles and from Europe poured in; but these adepts in mechanical and productive arts that so rapidly augmented the commonwealth staid away; there was nothing in surrounding nature or society to evolve the operative from the hod-carrier and drayman, and the prospecting manufacturer and his capital turned aside to newer towns where labor was uncontemned, and skill and technical knowledge sprang forward at the call of enlightened enterprise.

Men never guessed the whole money value of time until the great inventions for the facilitation of commerce began to appear. "Adopt us," these seemed to say as they came forward in procession, "or you cannot become or even remain great." But, even so, only those cities lying somewhere on right lines between the great centers of supply and demand could seize and hold them. It was the fate, not the fault, of New Orleans not to be one such. St. Louis, Louisville, Cincinnati, Pittsburg, Boston, New York, Philadelphia, Baltimore, were more fortunate; while Cleveland, Buffalo, Chicago, were born of these new conditions. The locomotive engine smote the commercial domain of New Orleans in half, and divided the best part of her trade beyond the mouth of the Ohio among her rivals. In that decade of development—1830–40—when the plantation idea was enriching her with one hand and robbing her of double with the other, the West was filling with town life, and railroads and canals were starting eagerly eastward and westward, bearing immense burdens of freight and travel and changing the scale of miles to that of hours. Boston and New York had preëmpted the future with their daring outlays, and clasped hands tighter with the States along the Ohio by lines of direct transit. Pennsylvania joined Philadelphia with the same river, and spent more money in railroads and canals than any other State in the Union. Baltimore reached out her Chesapeake and Ohio canal and railway. Ohio and Indiana spent millions. But the census of 1840 proclaimed New Orleans the fourth city of the Union, and her merchants openly professed the belief that they were to become the metropolis of America without exertion.

Rapid transit only amused them, while raw crops and milled breadstuffs still sought the cheapest rates of freight. They looked at the tabulated figures; they were still shipping their share of the Valley's vastly increased field products. It was not true, they said, with sudden resentment, that they "sold the skin for a groat and bought the tail for a shilling." But they did not look far enough. Improved transportation, denser settlement, labor-saving machinery, had immensely increased the West's producing power. New Orleans should have received and exported an even greater proportion—not merely quantity—of those products of the field. Partly not heeding, and partly unable to help it, she abandoned this magnificent surplus to the growing cities of the West and East. Still more did she fail to notice that the manufactures of the Mississippi and Ohio States had risen from fifty to one hundred and sixty-four millions. She only began to notice these facts as another decade was closing with 1850, when her small import trade had shrunken to less than a third that of Boston and a tenth that of New York.

Her people then began to call out in alarm. Now admitting, now denying, they marked, with a loser's impatience, the progress of other cities at what seemed to be their expense. Boston had surpassed them in numbers; Brooklyn was four-fifths their size; St. Louis, seven-eighths; Cincinnati was but a twenty-fifth behind; Louisville, Chicago, Buf-

falo, Pittsburg, were coming on with populations of from forty to fifty thousand. Where were the days when New Orleans was the commercial empress of her great valley and heir-apparent to the sovereignty of the world's trade? New York, Philadelphia, Baltimore, Liverpool—could they ever be overtaken? American merchant and Creole property-holder cried to each other to throw off their lethargy and place New Orleans where Nature had destined her to sit.

The air was full of diagnoses: There had been too exclusive an attention to the moving of crops; there had been too much false pride against mercantile pursuits; sanitation had been neglected; there had not been even a quarantine since 1825; public improvements had been few and trivial; a social exclusiveness made the town unhomelike and repellant to the higher order of immigrant; the port charges were suicidal. One pen even brought out the underlying fact of slave labor, and contrasted its voiceless acceptation of antiquated methods of work with the reflecting, outspeaking, acting liberty of the Northern workman which filled the Northern communities with practical thinkers. The absurd municipality system of city government, which split the city into four towns, was rightly blamed for much non-progression.

Much, too, was the more unjust blame laid at the door of financiers and capitalists. Railways? But who could swing a railway from New Orleans, in any direction, that would not better stretch it from some point near the center of Western supply to some other center in the manufacturing and consuming East? Slave labor had handed over the rich prize of European and New England immigration to the unmonopolized West, and the purely fortune-hunting canal-boat and locomotive pushed aside the slave and his owner and followed the free immigrant. And, in truth, it was years later, when the outstretched iron arms of Northern enterprise began to grasp the products of the South-west itself, that New Orleans capitalists, with more misgiving than enthusiasm, thrust out their first railway worthy of the name through the great plantation State of Mississippi.

Some lamented a lack of banking capital. But bankers knew that New York's was comparatively smaller. Some cried against summer absenteeism; but absenteeism was equally bad in the cities that had thriven most. Some pointed to the large proportion of foreigners; but the first census that gave this proportion showed it but forty-four and a half per cent. of the whites in New Orleans, against forty-two in Cincinnati, forty-eight in New York, and fifty-two in St. Louis. The truth lay deeper hid. In those cities American thought prevailed, and the incoming foreigner accepted it. In New Orleans American thought was foreign, unwelcome, disparaged by the unaspiring, satirical Creole, and often apologized for by the American, who found himself a minority in a combination of social forces oftener in sympathy with European ideas than with the moral energies and the enthusiastic and venturesome enterprise of the New World. Moreover, twenty-eight thousand slaves and free blacks hampered progress by sheer dead weight.

Was it true that the import trade needed only to be cultivated? Who should support it besides the planter? And the planter, all powerful as he was, was numerically a small minority, and his favorite investments were land and negroes. The wants of his slaves were only the most primitive, and their stupid and slovenly eye-service made the introduction of labor-saving machinery a farce. Who or what should make an import trade? Not the Southern valley. Not the West, either; for her imports, she must have straight lines and prompt deliveries.

Could manufactures be developed? Not easily, at least. The same fatal shadow fell upon them. The unintelligent, uneconomical black slave was unavailable for its service; and to graft upon the slave-burdened South the high-spirited operatives of other countries was impossible.

What did all this sum up? Stripped of disguises, it stood a triumph of machinery over slavery that could not be retrieved, save possibly through a social revolution so great and apparently so ruinous that the mention of it kindled a white heat of public exasperation.

All this was emphasized by the Creole. He retained much power still, as well by his natural force as by his ownership of real estate and his easy coalition with foreigners of like ideas. He cared little to understand. It was his pride not to be understood. He divided and paralyzed public sentiment when he could no longer rule it, and often met the most imperative calls for innovation with the most unbending conservatism. For every movement was change, and every change carried him nearer and nearer toward the current of American ideas and to absorption into their flood, which bore too much the semblance of annihilation. Hold back as he might, the transformation was appallingly swift. And now a new influence had set in, which more than all others was destined to promote, ever more and more, the unity of all the diverse elements of New Orleans society, and their equipment for the

task of placing their town in a leading rank among the greatest cities of the world.

V.

THE SCHOOL-MASTER.

THE year 1841 dates the rise in New Orleans of the modern system of free public schools. It really began in the German-American suburb, Lafayette; but the next year a single school was opened in the Second Municipality "with some dozen scholars of both sexes."

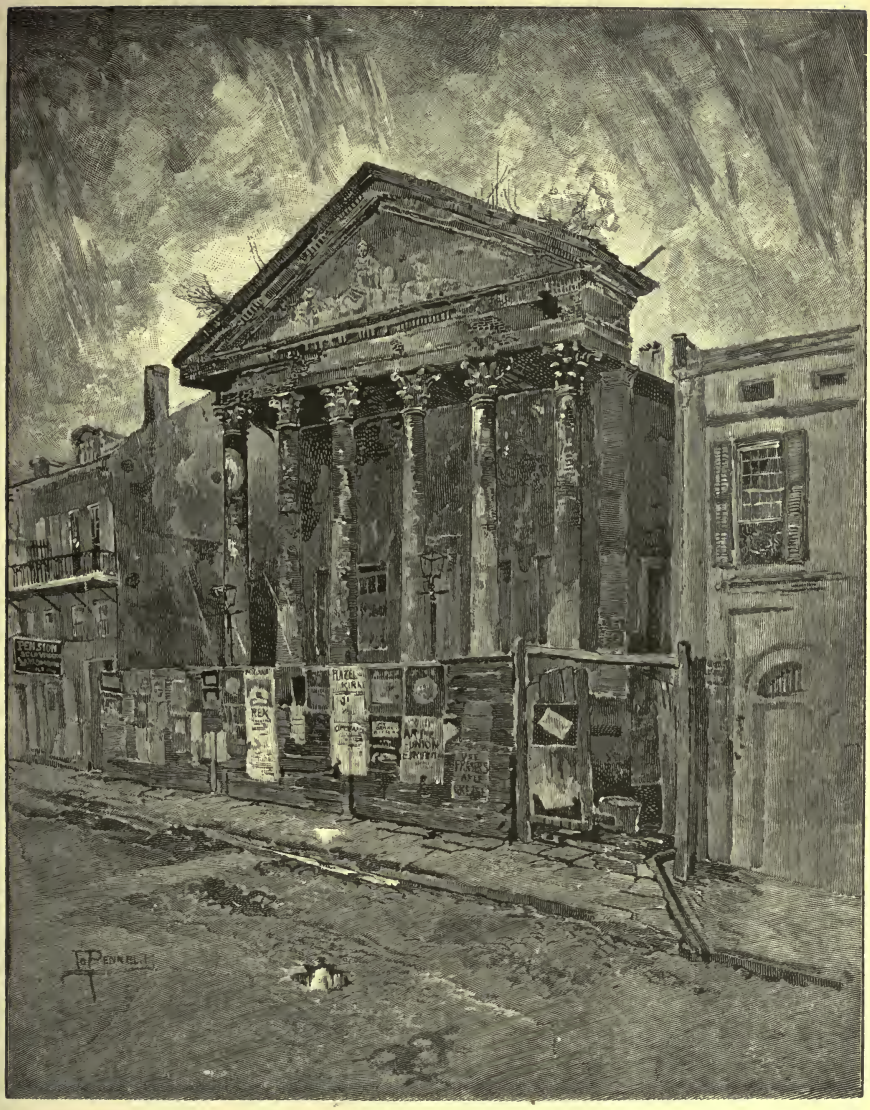
All the way back to the Cession, efforts, more or less feeble, had been made for public education; but all of them lacked that idea of popular and universal benefit which has made the American public school a welcome boon throughout America, not excepting Louisiana. In 1804, an act had passed "to establish a university in the territory of Orleans." The university was to comprise the "college of New Orleans." But seven years later nothing had been done. In 1812, however, there rose on the old Bayou road, a hundred yards or so beyond the former line of the town's rear ramparts, at the corner of St. Claude street, such a modest Orleans college as $15,000 would build and equip. But it was not free, except to fifty charity scholars. The idea was still that of condescending benevolence, not of a paying investment by society for its own protection and elevation. Ten years later this was the only school in the city of a public character. In 1826, there were three small schools where "all the branches of a polite education" were taught. Two of these were in the old Ursuline Convent. A fourth finds mention in 1838, but the college seems to have disappeared.

Still the mass of educable youth,—the children who played "oats, peas, beans," with French and German and Irish accents, about the countless sidewalk doorsteps of a city of one and two story cottages (it was almost such); the girls who carried their little brothers and sisters on one elbow and hip and stared in at weddings and funerals; the boys whose kite-flying and games were full of terms and outcries in mongrel French, and who abandoned everything at the wild clangor of bells and ran to fires where the volunteer firemen dropped the hose and wounded and killed each other in pitched battles; the ill-kept lads who risked their lives daily five months of the year swimming in the yellow whirlpools of the Mississippi among the wharves and flat-boats, who, naked and dripping, dodged the dignified police that stalked them among the cotton bales, who robbed mocking-birds' nests and orange and fig-trees, and trapped nonpareils and cardinals, orchard-orioles and indigo-birds, in the gardens of Lafayette and the suburban fields,—these had not been reached, had not been sought by the educator. The public recognition of a common vital interest in a common elevation was totally lacking.

At length this feeling was aroused. Men of public spirit spoke and acted; and such pioneers as Peters, Burke, Touro, Martin, De Bow, and the Creoles Dimitry, Forstall, Gayarre, and others are gratefully remembered by a later generation for their labors in the cause of education. In the beginning of 1842 there were in the American quarter 300 children in private schools and 2000 in none. At its close, the public schools of this quarter and Lafayette had over 1000 pupils. In the next year, there were over 1300; in 1844, there were 1800. In 1845, the University of Louisiana was really established. The medical department had already an existence; this branch and that of law were in full operation in 1847, and Creole and American sat side by side before their lecturers.

Meanwhile the impulse for popular enlightenment took another good direction. In 1842, Mr. B. F. French threw open a library to the public, which in four years numbered 7500 volumes. The State Library was formed, with 3000 volumes, for the use, mainly, of the Legislature. The City Library, also 3000 volumes, was formed. In 1848 it numbered 7500 volumes; but it was intended principally for the schools, and was not entirely free. An association threw open a collection of 2000 volumes. An historical society was revived. In 1846 and 1847 public lectures were given and heartily supported; but, in 1848, a third series was cut short by a terrible epidemic of cholera. About the same time, the "Fisk" Library of 6000 volumes, with "a building for their reception," was offered to the city. But enthusiasm had declined. The gift was neglected, and as late as 1854, the city was still without a single entirely free library.

In 1850 there was but one school, Sunday-school, or public library in Louisiana to each 73,966 persons, or 100 volumes to each 2310 persons. In Rhode Island, there were eleven and a half times as many books to each person. In Massachusetts, there were 100 volumes to every 188 persons. In the pioneer State of Michigan, without any large city, there was a volume to every fourth person. True, in Louisiana there were 100 volumes to every 1218 *free* persons, but this only throws us back upon the fact that 245,000 persons

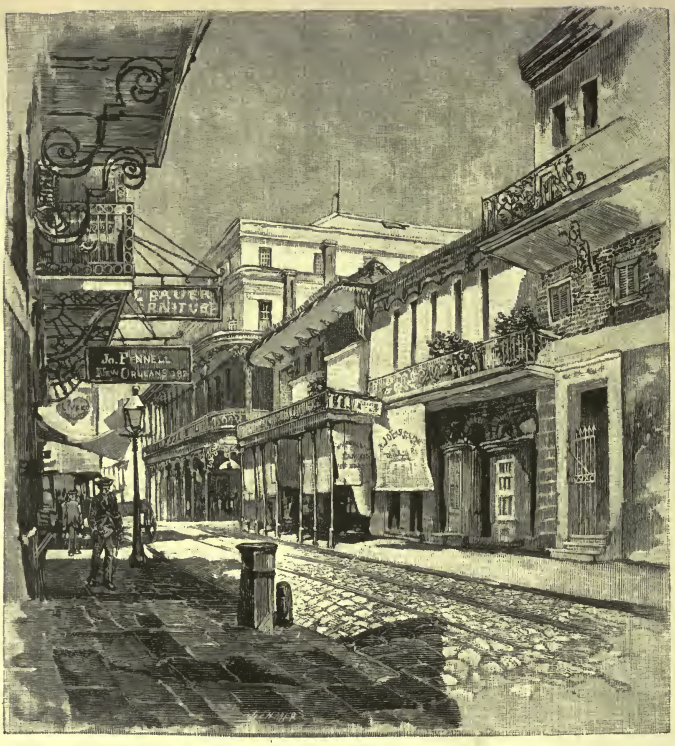


THE OLD BANK IN TOULOUSE STREET.

were totally without books and were forbidden by law to read.

It is pleasanter to know that the city's public schools grew rapidly in numbers and efficiency, and that, even when her library facilities were so meager, the proportion of youth in these schools was larger than in Baltimore or Cincinnati, only slightly inferior to St. Louis and New York, and decidedly surpassed only in Philadelphia and Boston. In the old French quarter, the approach of school-hour saw thousands of Creole children, satchel in hand, on their way to some old live-oak-shaded colonial villa, or to some old theater once the scene of nightly gambling and sword-cane fights, or to some ancient ball-room where the now faded quadroons had once shone in splendor and waltzed with the mercantile and official dignitaries of city and State, or to some bright, new school building, all windows and verandas. Thither they went for an English education. It was not first choice, but it was free, and — the father and mother admitted, with an amiable shrug — it was also best.

The old fierce enmity against the English tongue and American manners began to lose its practical weight and to be largely a matter of fireside sentiment. The rich Creole, both of plantation and town, still drew his inspira-



OLD ST. LOUIS HOTEL. (AFTERWARD THE STATE HOUSE.)

tions from French tradition,—not books,—and sought both culture and pastime in Paris. His polish heightened; his language improved; he dropped the West Indian softness that had crept into his pronunciation, and the Africanisms of his black nurse. His children still babbled them, but they were expected to cast them off about the time of their first communion. However, the suburban lands were sold, old town and down-town property was sinking in value, the trade with Latin countries languished, and the rich Creole was only one here and there among throngs of humbler brethren who were learning the hard lessons of pinched living. To these an English-American training was too valuable to be refused. They took kindly to the American's counting-room desk. They even began to emigrate across Canal street.

VI.

LATER DAYS.

Not schools only, but churches, multiplied rapidly. There was a great improvement in public order. Affrays were still common; the Know-nothing movement came on, and a few "thugs" terrorized the city with campaign broils, beating, stabbing, and shooting. Base political leaders and spoilsmen utilized these disorders, and they reached an unexpected climax and end one morning confronted by a vigilance committee, which had, under cover of night, seized the town arsenal behind the old Cabildo and barricaded the approaches to the Place d'Armes with uptorn paving-stones. But riots were no longer a feature of the city. It was no longer required that all the night-watch within a mile's circuit should rally at the sound of a rattle. Fire-engines were no longer needed to wet down huge mobs that threatened to demolish the Carondelet street broker's shops or the Cuban cigar stores. Drunken bargemen had ceased to swarm by many hundreds against the peace and dignity of the State, and the publicity and respectability of many other vicious practices disappeared.

Communication with the outside world was made much easier, prompter, and more frequent by the growth of railroads. Both the average Creole and the average American became more polished. The two types lost some of their points of difference. The American ceased to crave entrance into Creole society, having now separate circles of his own; and when they mingled it was on more equal terms, and the Creole was sometimes the proselyte. They were one on the great question that had made the Southern Ameri-

can the exasperated champion of ideas contrary to the ground principles of American social order. The New Orleans American was apt, moreover, by this time to be New-Orleans-born. He had learned some of the Creole lethargy, much of his love of pleasure and his childish delight in pageantry. St. Charles street — the center of the American quarter, the focus of American theaters and American indulgences in decanter and dice — seemed strangely un-American when Mardi-gras filled it with dense crowds, tinsel, rouge, grotesque rags, Circean masks, fool's-caps and harlequin colors, lewdness, mock music, and tipsy buffoonery. "We want," said one American of strange ambition, "to make our city the Naples of America."

By and by a cloud darkened the sky. Civil war came on. The Creole, in that struggle, was little different from the Southerner at large. A little more impetuous, it may be, a little more gayly reckless, a little more prone to reason from desire; gallant, brave, enduring, faithful; son, grandson, great-grandson, of good soldiers, and a better soldier every way and truer to himself than his courageous forefathers. But we will not follow him. Arming, marching, blockade, siege, surrender, military occupation, grass-grown streets, hungry women, darkened homes, broken hearts,—let us not write the chapter; at least, not now.

OLD "PASSAGE DE LA BOURSE" (EXCHANGE ALLEY AND STATE HOUSE.)

The war passed. The bitter days of Reconstruction followed. They, too, must rest unrecounted. The sky is brightening again. The love of the American Union has come back to the Creole and the American of New Orleans stronger, for its absence, than it ever was before; stronger, founded in a triple sense of right, necessity, and choice.

The great south gate of the Mississippi stands to-day a city of two hundred and sixteen thousand people. Only here and there a broad avenue, with double roadway and slender grassy groves of forest trees between, marks the old dividing lines of the faubourgs that have from time to time been gathered within her boundaries. Her streets measure five hundred and sixty-six miles of length. One hundred and forty miles of street railway traverse them. Her harbor, varying from 60 to 280 feet in depth, and from 1500 to 3000 feet in width, measures twelve miles in length on either shore, and more than half of this is in actual use.

One of the many developments in commerce, unforeseen by New Orleans in her days of over-confidence, was the increase in the size of sea-going vessels. It had been steady and rapid, but was only seen when the larger vessels had begun to shun the bars and mud-lumps of the river's mouths. In 1852 there were, for weeks, nearly forty ships aground there, suffering detentions of from two days to eight weeks. It is true, some slack-handed attention had been given to these bars from the earliest times. Even in 1721, M. de Pauger, a French engineer, had recommended a system for scouring them away, by confining the current, not materially different from that which proved so successful one hundred and fifty years later. The United States Government made surveys and reports in 1829, '37, '39, '47, and '51. But, while nature was now shoaling one "pass" and now deepening another, the effort to keep them open artificially was not efficiently or persistently made. Dredging, harrowing, jetty-ing, and side-canaling — all were proposed, and some were tried; but nothing of a permanent character was effected. In 1853 vessels were again grounding on the bars, where some of them remained for months.

At length, in 1874, Mr. James B. Eads came forward with a proposition to secure a permanent channel in one of the passes, twenty-eight feet deep, by a system of jetties. He met with strenuous opposition from pro-

EXCHANGE ALLEY, LOOKING TOWARD CANAL STREET.

fessional and unprofessional sources, but overcame both man and nature, and in July successfully completed the work which has made him world-famous and which promises to New Orleans once more a magnificent future. Through a "pass" where a few years ago vessels of ten feet draft went aground, a depth of thirty feet is assured. Capital has responded to this great change. Railroads have hurried and are hurrying down upon the city, and have joined her with Mexico and California; new energies, new ambitions, are felt by her people; and in every department of life and every branch of society there is earnest, intelligent effort to remove old drawbacks and prepare for the harvests of richer years.

A WOMAN'S REASON.*

BY W. D. HOWELLS,

Author of "Venetian Life," "A Chance Acquaintance," "A Modern Instance," etc.

X.

THE character of no man is fixed till it has been tried by that of the woman he loves. Till then he has only the materials of character, and they are all to be shaped and ordered as newly as if he had never had them before. The thousand and one mysteries of Helen's girlish uncertainty, her fantastic waverings, her æsthetic coquetries with the idea of being in love, were as unintelligible to Fenton as his headlong and outspoken passion was to her. But while she thought his bluntness charming, in a way, and constantly trembled nearer and nearer to him in her heart, Fenton was far too simple a fellow to feel anything but trouble at the misgivings and delays which she enjoyed. When at last he made what he felt must be his last offer, and she met it with all those freshly alarmed ideals and metaphysical scruples which a wiser and worse man would have trampled under foot,—tearing her from herself, as she unconsciously meant, and making her his in her own despite, as she reluctantly wished,—Fenton lost his head in a delirium of angry and wounded pride.

When he awoke from it, irretrievably committed to three years' exile, it was in a self-abhorrence and despair and a sort of stupefaction that he should have done what he had done. His repentance came before he had forgiven Helen, and long before he had begun to conceive that her letter might have another meaning than that which he had first taken from it. Of his own light, perhaps, he never saw more in it than it seemed to say. It was without reading it again, without having the heart to look at it, that he hated himself for what he had done, and loathed himself for his futile desire to make reparation. It was impossible to repair his fault, and if it were possible it would be despicable to attempt it.

He went haggardly about his duty—a machine that did its work, but with no more mind upon it than a machine. There came long spaces of time in which he afterward recognized that he had not known what he was doing; that he had been altogether absent without having been anywhere else. He awoke from these absences as from a profound, dreamless torpor and with a start of fear and amaze, to find that all had been going well in the meantime,—that he had been talking, eating, and drinking, and shrewdly attentive to whatever immediately concerned him. It would have been hard for him to say whether the time when he was on duty, and no one spoke to him, or the leisure in which he was intimately thrown with his brother officers, was the more terrible; his solitude was dense with piercing regrets that stung forever in the same place; his association with others was tormented by an unforgettable remorse, which, if it seemed to grant him a moment's oblivion, awoke him presently from somebody's joke or story to the consciousness that it had only been more deeply and inwardly gnawing his soul.

Some sort of action was indispensable, but action which did not relate to Helen was none. He began to write letters to her. He had no idea of sending them, but it had grown insufferable to be perpetually talking to her as he was in those airy dramas within himself; and since his words could not be made audible, he must let them take visible shape. This became his daily habit; and before the ship reached Rio de Janeiro he had accumulated a score of letters, which he bitterly amused himself by reading over and considering and putting by without destroying. He kept them, and found a sort of miserable relief in communing with them instead of his intangible thoughts. His industry did not escape the idle vigilance of the ship's comradery; but at sea every one must be suffered his whim, and after laughing at Fenton's they left him to it, in the feigned belief that it was a book he was writing—a marine novel, they decided. They each thought in the way of his rightful joke to say, "Don't put me into it, Fenton," till Fenton, who worked up slowly to his repartees, found presence of mind at last to answer: "No; I can't afford to make it dull, you know"; and then they left him quite alone, with a roar at the expense of the chance victim. Before the laugh was over Fenton had almost ceased to know what it was about, and had wholly ceased to

care. He was quite too miserable to be glad of the immunity he had won.

He went on with his letter-writing; but, on the eve of arrival at Rio de Janeiro, he destroyed all his work and set about writing one letter which should be his last. It was his purpose to post this without reference to consequences, as an act of final expiation. He was not without some trembling illusion that there might be a letter awaiting him: he did not dare to think from Helen, and he could not think from whom else. But his letter was to go before he knew what was in that, or even whether it existed. He had no reason to suppose it did exist; it was, in fact, as purely a figment of his distempered fancy as a starving man's visions of feasting; and when he had faithfully posted his letter before going to the consul to ask if there were anything for him, he could not make out that it was disappointment that sickened him to find there was nothing. But a mail was expected the following day, and he kept his wrecked hopes adrift upon its possibilities during the night.

The mail brought him no letter, but it brought the consul a copy of the "Boston Advertiser," which he politely offered to Lieutenant Fenton unopened, not having the leisure just then for the newspaper. Fenton unfolded it with indifference, and mechanically glanced at the marriages. The paper was of a date three or four days after he had sailed, and the name of Helen Harkness did not appear in the marriage list. He had not expected that it would, nevertheless he had looked at the marriages on her account; and he was about laying the paper aside when the record of a single death caught his eye. It was the death of Helen's father, with a dozen lines of mortuary praise. He dropped the paper.

"Nothing in the 'Advertiser'?" asked the consul, who was busy about some letters, without looking up.

"Too much!" said Fenton, pulling his cap over his eyes.

The consul thought this was a joke, and laughed in a companionable, uninterested way. Fenton looked at him and saw his innocence, and then he sat a long time in silence, with his arms folded and his head down. At last he asked the consul if he could give him a sheet of paper and an envelope, and briefly wrote the second of the two letters which had reached Helen together. In her desperation, she had found no resource but to open them according to the order of the dates in their postmarks, and she had seized first upon that of the 9th. It began simply, *Helen*, and it ran in this way:

"I hope you will have patience to read this letter through, though I have forfeited all right to a hearing from you. I am not going to make an appeal for your forgiveness, because I know I ought not to have it. I have suffered, not all that I ought to suffer, but all that human nature can suffer for that letter I sent you from Portsmouth. But I shall not try to work upon your pity; I believe that I have that already. I only wish you to understand that, in again renouncing all pretensions to your regard, I do it with a full approval of your conduct to me. I do not blame you in the least thing. I see that I was altogether to blame. I see what I did not see before: that you never cared for me, and that you tried with all your heart to be kind to me and yet not to give me hope. I thank you for your goodness, and I beg you to believe, when you have read this letter, that my eyes are open at last, and that, if I keep on loving you, it is because my love of you has become my life, and that I know I am no more worthy to love you than I am to live. I cannot help one or the other; but I can keep either from being troublesome to you, and I will. So I do not ask you to admit any of my former pretensions, but only to let me be your friend, in whatever humble and useful way I can. I consider myself a disgraced man, and I shall expect nothing of you but the kind of forbearance and patience you would show some repentant criminal who was depending upon your countenance for strength to reform himself.

"I know you have told Mr. Harkness of my Portsmouth letter, and that he must be very much incensed with me. But, though I do not ask your forgiveness, Helen, I do beseech you to try to get me his. I owe him all the little good there is in me, and I owe him all that I am and have done in this world. I could not tell you how dearly and truly I honor and love him. The thought that I came away without trying to take leave of him chokes me; but after writing you that fatal letter, everything that was right and decent became impossible.

"Good-bye, Helen. ROBERT FENTON."

When Helen had finished this letter, which, indeed, she seemed instantly to divine rather than to read, she not only kissed it, but pressed it to her breast and locked her arms upon it, clasping it close as if it were some living thing and could feel the wild, happy tumult of her heart. She wept long and sweetly over it. It might not have been the perfection of reason to another, but to her all the parts were linked together by an impenetrable and infrangible logic. Nay, it was not that, it was not eloquence; it was the sum of everything, it was love; and however hapless love to the writer, it was heaven-prospered passion to Helen, who seemed in that fond embrace to implore, to forgive, to console Robert, as if he were there present and she had fallen upon his neck. They were happy, and they were happy together; it was so much to know that she need never wish to know more.

For some time, in the rush of her emotion, she did not realize that it was not an answer to her own letter. But it was infinitely more. It forestalled and anticipated her letter, as that, when it came to his hand, would in its turn be both appeal and response to him.

Best of all, his letter made the first advance toward reconciliation, and assumed for Robert the blame for what she had suffered. She knew that he was not wholly to blame, but as a woman she liked to have him say that he was, and she liked him to be generously first in owning himself wrong—that always seems a man's part.

She had almost forgotten the letter of later date, the letter of the 10th, which still lay unopened before her. That, too, would be precious, but never so dear as this of the 9th, which should always be first in the history of their love; the other, no matter how sweet it proves, must always remain second. It was, in fact, not a fortunate inspiration. In his grief at the news which he had just read, Fenton's mind had reverted to the old relation in which he had first known Helen; and in the presence of the bereavement that they had both suffered in the loss of one who had been no less a father to him than to her, he addressed her as a sister, and signed himself as her brother Robert. These words, coming upon the different tenderness his other letter had evoked, seemed to push her coldly from him, to disown their love and to ignore it, to take her at a certain disadvantage with respect to the sorrow in which they humbly asked a brother's share; they made her jealous in a wild sort of her sorrow; they indescribably wounded her so that she threw the letter from her and wept bitter tears for the happy ones she had shed. It was such a letter as no woman would have written if she had been a man! She should not know which letter to answer now, nor how to answer either; for if she answered the first as she would have done, might not Robert think her bold and unfilial? and if she answered the second as she ought, would she not appear reserved and cold with him upon whom her heart had just thrown itself with such tender abandon? The letters made two Roberts of him, and left her to despair between them.

She passed a hapless night, and in the morning she took the first train after breakfast for Beverly, where she appeared at the Butlers' before ten o'clock, asking in such a high hysteric key for Mrs. Butler, who was not yet down, that they led her at once to her room. There she threw up her veil, revealing eyes tragic with tears and want of sleep, and gave the two letters into Mrs. Butler's hand while she hid her face in Mrs. Butler's pillow.

"Oh, Helen, Helen!" said the elder lady, when she had spelled through these documents in the dim light, "how glad I am for you! Come, look at me, my dear, and let me see your happy face? This makes up your quarrel, and you are—— Why, Helen!" she cried, when the girl, obeying, bent those eyes of tragedy upon her, "what is the matter? Don't you—didn't you——"

"Oh, yes, I care for him—all the world!" Helen broke out. "But the more I care for him the worse it is, and unless you can help me out of this trouble, Mrs. Butler, I shall surely go crazy. Oh, how indelicate it is of me to come to you! But I don't know what to do—I don't know what to do; I'm so horribly alone! And it's such a very strange, ridiculous thing!"

She did not suffer herself to pause, while Mrs. Butler stared compassionately at her, till she had put her in full possession of her perplexity, and explained how it had poisoned all her joy.

Mrs. Butler did not laugh at her; she was one of those high spirits who perceive the sacred rather than the absurd, and amidst the girl's wild talk she saw the reasonableness of pain that to a coarser sense would only have been ludicrous.

"You must not think of this second letter at all, Helen," she said, seriously. "Shall I tear it up?"

"Oh, oh!" said Helen, half-reaching for it, and yet holding her hand. "It's about papa, and—it's from *him!*" She caught her breath, and trembled for Mrs. Butler's decision.

"I didn't think of destroying it," said the other, "but I'm not going to let you have it back. This is the only letter you've got, Helen, for the present," she added, handing the girl the first, and putting the second under her pillow. "The letter that you sent him the other day—wouldn't that be a kind of answer to this?"

"Why, yes!" cried Helen, with electrical perception.

"Well, then, answer the first. I want you to let me keep this till—till I can give it back to Mrs. Fenton."

"Oh!" said Helen.

"And kiss me, my dear," said Mrs. Butler, fondly; "and bathe your eyes yonder. And if you touch the left-hand bell, Marian will come up."

"Oh!" said Helen, in the same shaken tone as before. "Shall you—shall you tell *her?*"

"No; you shall," replied Mrs. Butler. But when Marian came, it was Mrs. Butler who had to explain the embrace in which Helen seized her, and which, first returning with mechanical affection, she now returned with rapturous intelligence.

"Engaged?" she exulted. "Oh, Helen, Helen, Helen!"

"Why," cried Helen, laughing from her happy heart, and pulling away from her friend, "I don't know what you call it. I've written him a making-up letter, and he's written me one, and they've crossed on the way."

"Oh, *that's* an engagement," said Marian, with the authority of a connoisseur.

"But he hasn't got my letter yet, and I'm not engaged till he does."

"That's nothing. *He's* engaged, because you've got his, and in an engagement the man counts for everything; the girl goes without saying." Marian Butler was at that period full of those airs of self-abnegation with which women adorn themselves in the last days of betrothal and the first of marriage, and never afterward.

They talked Helen's whole affair over, in the light of the full candor which she was able to bring to bear upon it now for the first time. As to feelings, she must still have her reserves; but as to facts, she made them little by little all theirs; it helped her to realize Robert to be talking of him by his name, and to hear others doing so. At the sound of approaching footsteps without, Marian said:

"Now, mother, those children are not to know about this. They're too forthputting now, especially Jessie."

Ignorant of this supreme interest, the younger sisters were richly content with Helen's further account of her boarding-house life, which she continued to them like an installment of some intoxicating romance. When she came to the end of her chapter, she stopped with a manner that roused their worst suspicions.

"Oh, she's keeping something back!" complained Jessie, and "Oh, oh!" went up from the others.

"Yes!" cried Helen, "I'm keeping back the best of all, because it doesn't seem as if I *could* tell it."

While they all stared, she abruptly began the confession of her experiment in decorative keramics. She was by this time in high spirits, and she poured it all out, illustrating, mimicking, not sparing herself in the minutest particular of conceited expectation or forlorn reality. It was all past now, far past, and was part of a former existence which she had suddenly outlived by an untraversable period of time. It made them laugh, Marian with amusement, and Mrs. Butler with a sort of grieving compassion; as for the young girls, it seemed to them the wildest and most enviable adventure that ever was known out of a book.

"And you didn't meet a soul—not a soul you knew?" asked Mrs. Butler.

"Oh, no; *no* one shops in Boston now you know: and I was perfectly safe. But I shouldn't have cared."

"I should have been glad of it!" cried Jessie Butler. "I should have liked to lug my basket up and poke it into their carriage-doors, and offer to sell them things, and see how they would *look!*"

"Jessie!" said her mother.

"Well, never mind. Go on, go on, Helen!"

"That's all," said Helen, who had brought them back to the period of her return to her room and her long, desperate slumber. "No, the worst is to come! Miss Root came in while I was asleep, and discovered them; and what do you think I told her? I told her I had been doing them for a wedding present!"

There was fresh sensation at this, but Jessie exclaimed, "Marian Butler shall never have those vases in the world. They shall be *sold!* The idea! *I* will go up and sell them!"

"No," said Helen, soberly; "she must take them, Jessie, to save me from fibbing, if nothing else. Besides, you suggested painting pottery, Marian, and they're Beverly ware—all very appropriate, you see. And some of them are not so bad. And I can't give you anything better till—*my ship comes home!*"

At this idea of a ship, and of its coming home, Helen and Marian simultaneously pressed each other's hands, where they sat side by side on the lounge, with delicious intelligence. Marian said that she should prize Helen's present more than anything else that could be given her, and that its history, which could not be known out of the family, would make it all the more precious; the legend would be something to tell the future age. It would be great to say, "Only think of your great-grandmother's going about the whole day with these beautiful things, and not being able to sell them for a crust of bread to keep her from starving."

"Marian," said her mother, "I can't let you make a joke of it. I can't help thinking how wretched it would have been if poor Helen had really been in need."

"Indeed, I *was* in need, Mrs. Butler," said Helen, "while I was doing those things. I felt just as *destitute!* And I worked at them early and late, as if my life depended upon it."

"Oh, that's a very different thing, my dear," said Mrs. Butler. "It was only play poverty, after all. Think if you had really been some poor girl, with nothing, and had met with such a disappointment!"

"I don't believe I could have suffered more," said Helen, confidently.

"I'm glad you've no means of knowing certainly. But now that you've tried your experiment, Helen, hadn't you better end this

little escapade, and come back to us? Things have come about very fortunately," she added quickly, at a look of refusal in Helen's eye, "and your failure to earn a living makes it easier for me to tell you something that's been rather weighing upon my mind."

She spoke with a double sense to Helen, who understood that it was not her failure, but the letter from Robert which made it easy for Mrs. Butler to say what followed.

"We have concluded not to wait a month after Marian is married before we sail, but to go the next week. We shall not try to run them down——Girls," she broke off, and speaking with the tone of authority which they knew when they heard it, "go and see where your father is," and when they were gone, she resumed,—"but we shall follow them up pretty closely, and we shall meet them in Venice just before they start from Trieste for Egypt. Now, Marian!"

"And there," said Marian, "Miss Harkness, who has come to that point with the bride's family, will join the happy couple, and make one of their party up the Nile. It's to be a trusteeship, Helen," she cried; "it can't be resigned. You must come. We are going to take a dahabeah at Cairo with some Philadelphia friends of Ned's, very quiet people whom he took a great fancy to; and I want you along to do the correct, and elegant, and superior thing for Boston, and leave me to uninterrupted enjoyment of the billies. Yes, Helen, you must come. Ned wishes it as much as I, and I can't tell you how much that is. We want to take you away from yourself, and we promise to bring you back in a year"—she hesitated: "I was pausing for want of an idea, but say—improved in every way."

"Oh, I can't!" lamented Helen. She leaned back upon the lounge and brooded upon the matter in a silence to which the others left her unmolested. "It isn't because it doesn't seem the loveliest and kindest thing in the world, Marian, and I've no peasant-pride that would prevent me from accepting it; and it isn't because I think I should do better to go on trying to take care of myself, Mrs. Butler. I know that I'm a distinct failure in that way, and I haven't any heart or conceit for further experiments. But—I must stay! He will come back—I know he will come back as soon as he gets that letter of mine,—and he must find me here waiting for him. It would be a shocking kind of treachery if I were away."

"You could write to him now that you were going with us," said Marian, a good deal shaken by the heroism of Helen's position, "and he could meet you somewhere abroad."

Mrs. Butler said nothing.

"The second letter might miss," replied Helen, as if the first letter could not.

"You could keep writing," urged Marian, "before you sailed, and then from Europe."

"No; it wouldn't do. He must find me here waiting for him; and I mustn't stir from the spot till he gets back. I don't know how to explain it exactly. But it would look very queer and light-minded, wouldn't it, if I went off junketing up the Nile while he was thinking all the time that I was forlornly waiting for him in Boston, and was as unhappy as he till we met? Besides, I feel this way about it, after what has passed between us: I ought not to be on a high horse of any sort when Robert comes back. I feel that it is his right and his due to be able to stoop to me a little; and it would only be a just reparation for me to be in very humble circumstances when I met him. Doesn't that seem like a kind of reason to you, Mrs. Butler?"

"Yes," assented Mrs. Butler, doubtfully; "a little romantic."

"Do you think so?" asked Helen, rather hurt. "I hoped you would think it sensible."

"I do, my dear, I do," Mrs. Butler hastened to reply, "from your point of view."

"There's this, too," Helen added, not quite appeased, after a hesitation. "Robert hasn't any money but his pay; and I only have such a very little that we couldn't begin living like rich people; and the question is whether I had better keep on living as I used to do, or whether I hadn't better get accustomed to something very plain and simple at once."

"Yes," said Mrs. Butler, while Marian fidgeted in protest, but said nothing.

"I try to look at it quite dispassionately and in the light of common sense, without any foolishness, and it seems to me that I shouldn't be doing right unless I were making some sacrifice for Robert, and suffering, don't you know, in some way. I should not be happy unless I were. You know," she said, softly, "that I don't think I always used Robert very well. I don't mean that I meant to; but I didn't understand myself; and now that I do, and understand him, I should be detestable if I went off to be pleased and diverted while he was hurrying home with his mind burning upon the thought that I was waiting here in perfect wretchedness till he came. Don't you see? I must be here, and I must be wretched, to be perfectly true to him!"

"You are right, Helen!" cried Mrs. Butler, deeply moved by this divine logic of the heart. "Hush, Marian, don't speak! You know she is right. Come here, Helen!" The

matron embraced the girl in the fervor of that youth which women of all ages have in common. "We wont say anything more of this matter, Marian, and we will just tell your father that Helen can't go. You wont mind my letting out a little of your secret to him?"

"Oh, no!" blushed Helen. "I had expected you to tell him."

Captain Butler would once have teased the girl about her happiness; but since her father's death he seemed not to have been able to treat her lightly. Her loss and her uncertain future made her a serious affair to him; and now that her father was gone, Helen was startled at times to find how much his old friend was like him. There were tones and movements of strange resemblance. Perhaps the impression came partly from Captain Butler's impaired health; he was certainly not well, and that made her think of her father. He took what Mrs. Butler told him very much as her father would have done, she thought, and he expressed his satisfaction almost as quietly. His only revenge was to ask:

"Shall you answer in care of the Navy Department, or would you like to telegraph a reply?"

"Oh, Captain Butler," cried Helen, "*could* I telegraph?"

"Yes," said the Captain. "How would you word your dispatch?"

"Mr. Butler!" said his wife in reproach

"I—I don't know!" gasped Helen.

"It wouldn't reach him, now, any sooner than your letter of three weeks ago. He'll find that at Hong Kong when he gets there, and you wouldn't know where to hit him with a telegram on the way. If your letter was posted at Rio, the *Muskingum*——"

"*Messasauga*," Helen softly corrected him.

"Was it *Messasauga?*—is going round the Cape of Good Hope, and she must have passed that point a week ago, and she wont stop at any other telegraphic port, probably. Here," said the Captain, with rising interest, "I'll show you his course."

He got a chart out of the library, and then Helen began to study navigation with the impassioned devotion which love lends to intellectual pursuits. One observes this ardor in two young persons of opposite sexes who take up some branch of literature or science together which they might not perhaps have thought of if they had not thought of each other. It has been known to cast a purple light upon metaphysics. Helen borrowed the chart and brought it away with her.

It was a happy day, and its memory remained to sweeten the days in the increasing bustle of preparation for Marian's wedding—when Helen saw her friends less and less—and then the days when she saw them no more.

XI.

HELEN'S letter, crossing the letter Fenton wrote at Rio de Janeiro, reached him at Hong Kong. It added, after the first hours of rapture, the anguish of a hopeless longing to the remorse he had been suffering. It was no longer a question of her forgiveness; but he did not find it easier, now that he had the assurance of her love, to forgive himself for his rashness. He thought of her alone in her sorrow, without the instant sympathy and support which she had a right to expect from him, even if there had been no tie but their common affection for her father between them; and his whole life centered in an impulse to return to her somehow from the banishment he had inflicted upon himself. But he had himself made return impossible—for the present at least—by the terms on which he had sought exile. He must wait and he must suffer,—that would have been simple enough,—and he must also make her wait and suffer. When he came to this conclusion, as he always must, it was with a mental shock that was like a veritable concussion of the brain that left him weaker day by day, and that broke him at last. He fell sick of a disorder that baffled the science of the surgeon when he visited him in his room.

"What the devil *is* the matter with you? I believe in my soul you're *trying* to make a die of it," said the doctor, a cheerful, elderly man, tight in his uniform.

"No man ever wanted to live as I do," answered Fenton.

"Well, then, you must brace up. I'll give you a tonic. Make you up a bottle and send it to you." The doctor felt his pulse again and said: "You're either down with the climate, and that affects your spirits, or else it's your spirits that affect your health. But in any case you must brace up." As Fenton lay perfectly still with his face turned away, Doctor Simmons passed his hand over the top of his head, where a perspiration of perplexity had gathered in the scattering down. "I can't minister to a mind diseased, you know," he suggested.

"No," said Fenton.

"You must go to some other shop."

He got himself with difficulty out of Fenton's door into the wardroom, and presently sent him the bottle. It seemed to make him worse, and the doctor visited him again in renewed mystification. After the usual inspection, he sat looking at Fenton as before, and then said, casually:

"What a lucky chap Nixon is, going home on leave so soon!"

Fenton sat up.

"Going *home!* Oh, my God!"

He fell back on his pillow, and the doctor nodded his head.

"I thought so. You're homesick. Nixon isn't going home; but if you keep on in this way *you* are,—in a box. This thing will kill you as sure as you live if you don't fight it; and if you've got particular reasons for living, as you intimated the other day, you'd better make the most of them. Get leave and go off somewhere for awhile. Amuse yourself; try to forget about it. You can worry it off somehow. You *must;* and so I tell you."

"Two days after I sailed, the man who had taken care of me all my life and been more than a father to me died suddenly and left his only child alone in the world," said Fenton, desperately. "How am I to worry that off? I ought to be there—to help her, to take care of her, to show the gratitude that common decency——"

"Well, that *is* bad," assented the doctor. "But she's got friends, of course?"

"Oh, *friends*, yes!"

"And of course she'll be looked after. You must try to see the bright side of it," added the doctor. "There's a bright side to everything."

"Do you think so? Then I'll tell you the bright side to this. I came away in a quarrel with them—a quarrel where I was to blame—without seeing them or saying a word to them; and I can't ask leave to go home, because I made a point of getting ordered here. That's the bright side of it!"

"It isn't very dazzling," admitted the doctor, with the smile that men put on at other men's troubles of sentiment. "But it isn't a thing to be morbid about. You can write home and explain. You're a little under the influence of the climate here; you'll see all these things differently when you're used to it. I'd better give you some quinine. There's no use in giving way; you'll only make bad worse."

The shame of having confessed to an anxiety that another seemed to find so slight was a powerful auxiliary in the effort of will that Fenton made to overcome its physical effects. He succeeded so far that he was able to go on duty again, after a week or two, and to live doggedly on from day to day in that double consciousness where the secret trouble remains a dull, incessant ache underneath all the outward conditions. It began to be a superstition with him that something must happen, some chance of escape must offer; he could not yet bring himself to the thought of the last resort, though the knowledge that at the end of all he could resign and go home continually tempted him.

Helen's letters, as they came, were brave and hopeful, and she only wrote of the time when they should meet; he instinctively wrote as if this time must be near. Then the mere lapse of days and weeks began to have its effect as it does in every human affliction; it lessened his burden by making it a thing of custom, to which his life adjusted itself. He had not less to bear, but he had learned better how to bear it; and the pride and joy which he had felt in Helen's love, even when he felt himself least worthy of it, seemed more and more his right, and less and less his unlawful possession. Apparently she was pleasantly placed in the house which she amusingly described to him, and she was living quietly and trustfully on there, waiting for his return. She wrote him very freely about everything else, but she shrank from telling him of her experiment in decorating pottery for sale, because she would not let him know that she had ever thought herself in need. She never spoke of any need in her life except his return; she only spoke of that in answer to his letters saying that he would use every effort to get back; and then she said that they must both have patience, and that she would be content to wait all her days for him, rather than have him do anything that he would not have done if she had not wished. She said something that made Fenton smile about her knowing that he would not dream of deserting his post of duty; and then she begged his forgiveness if she had seemed to express any fear of such a thing; and again she said that she was very well and very contented, and that he must not worry about her, and she only wished that he could look into her little room at Mrs. Hewitt's and see how comfortable she was.

To the next letter, which reached him a month later, she put a postscript in which she offered to give him back every word that bound him to such a helpless and foolish creature as she was, but told him that it would kill her if he consented. "If it were not for thinking of you, Robert, I should hardly have the courage to keep up. If you were ever to be unkind to me again, no matter if it were entirely my fault, I could not forgive you, but I should die in the attempt. There are some things," she added, with subtle relevancy, "about my every-day life, and its cares and difficulties, that make me wish for your advice, but you are too far away for that; and if you were here, I should not have the troubles and should not need the advice. It all comes from my not having any head for

figures, and not calculating beforehand, instead of afterward, when it does no good; and then I have to pay a poor girl's penalty for flinging money away as no rich girl ought."

The day she wrote, Helen had met in the street one of the women whose name she had put down on her list of the things "To be given away" before the auction, for certain tables, chairs, and bedsteads, which Captain Butler, in the use of a wise discretion, had ordered to be sold for the benefit of the estate. Mrs. Sullivan, though poor, was not proud, and she was one of those who had formerly profited by the sums which Helen saved from hack-hire. She now thanked her for a small present of old clothes, which, being sent her before Captain Butler's agency in Helen's charities began, had really reached her. Helen saw the expectation of future old clothes in the woman's eye, and thought it right to cut off her vain hope.

"I'm afraid I shall not have any more clothes for you very soon," she said, coldly. "I must wear my old things myself after this." Then, with some exasperation at being invited to an impossible beneficence, where she had already done so much, she added: "I hope you found the furniture useful, Mrs. Sullivan?"

"What foornitoor, Miss?" quavered the poor woman, reduced to destitution by the idea of the prosperity that had evaded her; and it came out that she had never received the things intended for her.

Helen did not pause to inquire how this had happened.

"There has been some misunderstanding, Mrs. Sullivan," she said, loftily; "but I don't intend that you shall be the sufferer by it." She gave Mrs. Sullivan everything she had in her porte-monnaie except some horse-car tickets. "It may not be so much as the furniture was worth, but it's ready money, and no doubt you can buy things with it that you would rather have."

Mrs. Sullivan was apparently not inclined to this opinion; the loss, because uncertain, seemed greater; but she did not fail to invoke God's favor upon Helen, and she asked for her washing as an amend for the unmerited deprivation which the Sullivan family had undergone through her. Helen hurried home, and found that she had given Mrs. Sullivan all her money but ten dollars, and that now she must encroach upon her capital at last. She must go to the lawyer in whose hands Captain Butler had left her money, and ask him for some of it. She could have wept for vexation at her rashness and shame for the necessity to which it had brought her; but the sum of her varying moods was the mood of self-pity in which she wrote that postscript to Robert. She was sorry for it as soon as she had posted the letter, but even then she merely regretted it as the expression of a mood, which she had always said was foolish in writing a letter.

Fenton had never imagined her poor, or in need of any kind; the fancy of a lover does not deal with material circumstances; but he now made ample amends for the past failure. He took unsparing blame to himself for the false delicacy that had kept him from asking in what state her father's affairs had been left, for not making her tell him how much or how little she had. At this first vague hint of cares and difficulties—of the necessity of saving—which she had allowed to escape her, he saw her in a poverty that scarcely stopped short of the municipal soup-kitchen. With the distance which he had put between them, how could he hope to help her? How could he even intimate his longing to do so without wounding her? He wore himself out in vain contrivance for getting his pay to her in some secret and anonymous way.

Her next letter was cheerful and happy, with no hint of trouble; but he could see nothing in it but a feint of gayety, a pretense to keep him in heart about her; and the effect of time and will were undone in him.

"I don't understand all this bother of yours, Fenton," said the doctor, to whom he applied once more. "But I guess you've got to go home. You're dying here."

"Going home doesn't follow," replied Fenton.

"You're useless, and worse than useless, as you are, here," continued the doctor. "I know how you feel about it. You feel that it's a disgrace to give up; but you're sick, and you're as irresponsibly sick as if you had the consumption. You have got to look at it in that light."

"I can't go," said Fenton.

"Oh, very well," retorted the doctor. "I can't force a man to live."

That night, as Fenton sat in the ward-room with two or three others who were smoking and reading, while he pretended to read, the figure of Helen suddenly glided out of the empty air and paused full form before him. It melted by slow degrees away, her face vanishing last, and leaving him with a sense of her strange look. It was neither sad nor reproachful, but of a peculiarly sweet and gentle archness.

He turned a ghastly countenance on the doctor, whom he found looking at him across the table. He trembled to his feet, and the doctor ran round and helped him to his room.

"Well?" he impatiently demanded, when they were alone in his room.

"She's dead! I saw her ghost!" whispered Fenton.

The perspiration, which stood in drops on his forehead, bathed the clammy hand with which he clutched the doctor's warm, hairy fist.

"I agree to the ghost," the doctor answered, cheerfully, "but I guess she isn't dead, all the same."

"You think not?" queried Fenton, with a childish submissiveness. "But—but I saw her!"

"Oh, no doubt," replied Simmons. "If you keep on at this rate, you'll see a ballroom full of her! It's a phenomenon of your condition. You turn in, now, and I'll make you up a bottle that will keep her away till to-morrow night, anyway."

The surgeon had the professional humanity, and he would have pitied Fenton as the doctor pities his patient, even if he had felt no personal kindness for him. But he really had a liking for the young fellow; he respected him as the most striking case of nostalgia that had ever come under his notice. The case was all the more interesting from the character of the man, which was one of stubborn endurance in everything. His pride was as evident as his quick temper; and yet here he was, beaten down, perfectly broken up, by a purely moral disorder.

"If I had not got that man away," Doctor Simmons could say in imaginable boastings that were to hold future wardrooms in awe, "he would have died, sir; died of sheer homesickness!"

Of any other sort of sickness with which the nostalgia was complicated, no intimation seemed to have penetrated to the doctor's thickened consciousness. It was long since he had had any love affairs of his own; the passion, as he had observed it later in life, was not apt to manifest itself in any such condition as Fenton's. He ascertained that the apparition was that of the lieutenant's adoptive sister, and he rested in that knowledge. But the fact that patients suffering from nostalgia were sometimes haunted by visions of absent friends was an incident of the malady noted in the books, and upon its occurrence every possible means should be made to secure their return home.

It was upon this authority and this conviction that Doctor Simmons approached the Admiral in Fenton's behalf. He explained the case with scientific zeal, and then dwelt upon the peculiar circumstances which rendered it impossible for Mr. Fenton to apply for leave to return, while he was at the same time in such a condition of mind that to condemn him for service by medical survey and send him home in that way would be simply sentencing him to death. The doctor acknowledged the irregularity of his own proceeding in making this appeal; but he urged the extremity and the delicacy of the case in justification. Mr. Fenton would certainly not survive if he remained on the station. Doctor Simmons staked his professional reputation upon that, and without presuming to suggest anything, he begged the Admiral to consider whether some public interest could not be served by Mr. Fenton's return on duty. The next day Fenton received orders to sail by the first steamer from Yokohama with dispatches for Washington. It was at the time of the war between Japan and Corea, in which, as is well known, certain eventualities threatened to compromise American interests.

When Doctor Simmons visited his patient after the orders reached him, he was rewarded for the tact with which he had accomplished his difficult task by Fenton's accusation that he had brought the result about. He expected this, and in the interest of science he met the accusation with lies so prompt that they would have carried conviction to any mind less sore and disordered than Fenton's. He told him that his orders were a godsend, and advised him not to trouble himself about how or why they had been given. In fact, the situation admitted of nothing but obedience; upon the face of it there was no point that the most self-accusing scruples could lay hold of; and Fenton discovered with helpless shame that all the natural forces in him were fighting against his broken will. He was quite ready for the steamer that sailed in a few days for Yokohama and San Francisco; and he accepted his good fortune upon the best terms he could. When it was too late, he began to realize his obligation to the man who had saved his life, and given it back to him with such hope as now rioted in his heart at every thought of Helen and of home. He was a week out from Yokohama, and he could do nothing but write a letter to the surgeon, trying to make up for his past thanklessness by a vain and remote profusion of gratitude.

He was, as he figured it, only a fortnight from San Francisco, and, unless he suffered some detention at Washington, only a little over three weeks from Helen. The possibility that he might be ordered away upon some other service before he saw her occurred to him, but only as one of those disasters which each of us regards as too cruel and monstrous ever to happen to himself. He bet on the highest figures in the pools formed to guess at the run of the ship from day to day; and the lady who held the pools was not long in divining the cause of his sanguine faith in a

short passage. Mrs. Bowers was going to join her husband in San Francisco; the similarity of their objects gave them a natural interest in each other, and a man of Fenton's ordinary good sense and reserve was capable of confiding in this sympathizing listener, with the lover's ingenuous egotism, so incredible to us later in life. He talked continually of Helen to her, when perhaps she would much rather have had him talk about himself, as they walked up and down the deck together; he told her everything but Helen's name, which she threatened she would have yet before they got to San Francisco. In the meantime they always spoke of Helen as the Mystery. It was folly, but it made Fenton transcendently happy; these confidences brought Helen nearer, they realized her; they almost, in the spiritualists' phrase, materialized her. The time came when, the moonless night being propitious, he told Mrs. Bowers of the apparition of Helen, and asked her what she thought of it. She said that she thought it the most wonderful thing she had ever heard of: but she owned that she did not know what it meant. She added that she should always stand in awe of a person who had had such a thing happen to them; and then she pressed the arm on which she clung, and giggled; and the next moment she shrieked. There had been a sudden, violent wrench and shock; and her cry was answered, after a moment's deathly silence, by a confused clamor from all parts of the ship; and the passengers came rushing up from below, where they had been playing euchre, and singing hymns, and eating bacon and Welsh rabbit, and implored one another to say what had happened. According to usage everywhere in cases of accident, there was no authority to turn to for information; the officers of the ship were each about his duty, and they severally and collectively underwent severe criticism from the passengers for their absence from the scene of the common dismay and curiosity.

Fenton was the first, in virtue of his office and mission, to learn that the ship had broken her shaft, and must put back to Yokohama. He received his sentence with desperate fortitude.

"I think we *might* get you back in time for the next boat," said the captain, considerate of the haste of a bearer of dispatches; "but it would be only a chance. This is a sailing craft now. With a fair wind all the way, we might do it; but that's almost too much to hope for. Of course, we might meet the next boat on her way home before we make Yokohama, but that would be still more of a chance."

"Well, I must go back with you, that's all," replied Fenton.

"Yes, there's nothing else for it, that I see."

The passengers in the saloon were divided between two minds, and inclined in about equal numbers to hold a service of song and thanksgiving for their delivery from danger, and to organize an indignation meeting for the adoption of resolutions condemning the captain for snubbing a committee of inquiry which had presented a just interrogation as to his purposes, in view of the accident. It appeared, from the best informed, that the captain had at once put his ship about, not only without consulting the passengers' wishes, but evidently without considering whether it was not quite as feasible to push on to San Francisco as to return to Yokohama. There were attempts to commit some of the stewards to the former hypothesis.

About noon the next day, the captain spoke a ship, which, under a full press of canvas, was making speed eastward that mocked the laggard reluctance of the steamer on her backward course. She proved to be the clipper *Meteor*, bound for San Francisco, for a freight of wheat to Europe. The captain invited Fenton on to the bridge.

"There's your chance," he said, "if you want to risk it. But you must be quick about it."

"How much of a chance is it?" asked Fenton.

"Those clippers often make very quick runs. She's bound straight for where you want to go. I can't advise, and I don't know whether they'll take you."

"I'll risk it!" said Fenton.

If he had been given more time to hesitate he might have refused the risk; but he was not given the time. He scratched a line to Helen, telling her what had happened, for the captain of the steamer to post in Yokohama when he got back, so that she might have some intelligence of him in case of further delay; but, when he had finished his letter, he decided that it would distress her with needless anxiety if it reached her before his arrival, and that it would in all probability come after him; and so he put it into his pocket instead of giving it to the captain. In the meantime, there was further unintelligible parley with the clipper; she shortened sail and hove to, and before the other passengers had well realized the fact, Fenton and his baggage were in the boat which the steamer had lowered, and which was rising and sinking on the long swells that stretched between her and the other ship. Mrs. Bowers had parted from him with effusion: "I know you'll find her alive and well," she whispered in generous sympathy; and he volunteered to look Mr. Bowers up in San Francisco, and tell him all about everything.

The other passengers received the adieux which he waved and bowed them, in that awe which Americans like to feel for any representative of the national dignity: we see so little of it. Fenton had put on his uniform to affect as powerfully as possible the imagination of the captain of the clipper, who was quite master to refuse him passage, after all; the captain of the steamer had not thought it best to make too plain his purpose in sending out a boat to the hasty stranger.

Both his precaution and Fenton's had been well taken. When Captain Rollins of the *Meteor* came to understand the reason why his ship had been stopped, he discharged a blast of profanity of a range that included nearly everything in animated nature except Lieutenant Fenton, who stood sternly patient before him until he should finish; perhaps it devoted him the more terribly by this exception. When the captain stopped for breath, Fenton leaned over the rail and motioned off the steamer's boat, which lay rocking on the sea by the ship's side; he had taken the precaution to have his baggage brought on board with himself.

"I am bearer of dispatches to Washington from the flag-ship at Hong-Kong. Of course you expect to take me on to San Francisco, and I expect to pay you for the best quarters you can give me. I am Lieutenant Fenton of the *Messasauga*. What is your name?"

"Rollins," growled the captain.

"Here, my man," said Fenton to one of the seamen, "take these things to Captain Rollins's room."

The uniform and the secure bearing had their effect; few men know just what is the quality and the authority of a bearer of dispatches. The sailor obeyed and the skipper submitted. He was by no means a bad fellow. He belonged to the old school of sea-captains, now almost as extinct as the pirates whose diction they inherited. His furious blasphemies were merely what in another man would have been some tacit reflections upon the vexatious nature of the case.

Fenton found himself neither uncomfortable nor really unwelcome on the *Meteor*. Upon the hint given him, the captain turned out of his room for the lieutenant, and he caused some distinct improvements to be made in the ship's fare. There were a number of Chinese in the steerage; and among the passengers in the cabin were a young American lady returning with her mother from a visit to her brother in China, and a man from Kankakee, Illinois, who had been out looking up the sorghum culture in its native land. The sea monotony which Fenton's coming had broken for the moment promptly returned upon this company. The young lady had not Mrs. Bowers's art of making attentions to herself appear an act of devotion to Helen, and Fenton offered her only the necessary politeness. What companionship he had was with the Kankakee man—a small, meager, melancholy figure, full of an unembittered discouragement. Continual failure in life had apparently subdued him into acquiescence in whatever happened, without destroying his faith in the schemes he projected; he was disheartened with himself, not with them, and he had the gentleness of a timid nature which curiously appealed to the gentleness of Fenton's courage. He confessed that the first encounter between the lieutenant and the captain of the ship had given him apprehensions, and he insinuated a deep admiration for Fenton's behavior in that difficult moment. He attached himself to the stronger man, and accepted him in detail with a simple devotion which seemed to refer as much to Fenton's personal presence as to his moral qualities; and, in fact, the lieutenant was then a gallant figure. The oval of his regular face had been chiseled by his sickness into something impressively fine; with his good nose and mouth, his dark mustache and imperial, and his brown tint, he was that sort of young American whom you might pronounce an Italian before you had seen the American look in his gray eyes. His slight figure had a greater apparent height than it really attained.

"You see," explained the Kankakee man, whose name proved to be Giffen, "my idea was that if I could go right in among the Chinese people, and find out how the thing was carried on, and mebbe talk with some of their leading agriculturists about it, I could do more to get the sorghum culture going among us in six months than the Agricultural Department of Washington could in six years. It's bound to come. It wont come in my time, nor through anything I've done, but that sorghum interest is bound to be a big thing with us yet. We've got the climate, and we've got the soil for it. I'll allow I've had sorghum on the brain ever since I first saw it; but that's no reason I'm mistaken about it. I *know* it's got to come, and if I could have hit it the way I expected, I could have done more good, and made more money in two years after I got home than I'd known what to do with."

"And how was it you didn't hit it?" asked Fenton.

"Well, you see," said the Kankakee man, "I found I couldn't talk the language, for *one* thing. And then I couldn't seem to get anybody interested. I *did* try to get into the country districts, but I couldn't make any great headway—such a prejudice against foreigners amongst the Chi-

nese; and I hadn't very much money with me, and I concluded to give it up. But I found out enough to know that our people can't grow sorghum on the Chinese plan and make it pay; labor's too dear, and we've got to employ machinery. I've got the idea of a sorghum-planter that, if I can get any one to take hold of it, is going to make *some*body's fortune. Have you ever been to Alaska?"

"No," said Fenton.

"They say there's good soil in Alaska," continued Giffen, "and there's nothing to prevent it's being a great agricultural country except the frost four or five feet down. Sun can't get at it on account of the moss. But you scrape that moss off once, and let the sun have a fair show for one summer,—well, I believe the thing can be done, if any one had the sense to go about it the right way. And I've got my eye on a kind of coffee that they grow on the Sandwich Islands that I believe can be introduced with us, if the right parties can be got to take hold of it."

The good weather continued for another week, with westerly winds that carried the *Meteor* on her course till she had made nearly three thousand miles since leaving Shanghai. Each day took him two hundred or two hundred and fifty nearer home, and Fenton looked forward to a prosperous run all the way to San Francisco with hopes that he dutifully disguised to himself as fears. Toward the end of the week the wind began to haul back to the southward, and fell till it scarcely stirred a ripple on the sea, but he did not lose courage. He explained to the other passengers that they could afford to lose a few days' time and still make one of the greatest runs on record. They heard him with the trust due a man of his experience and profession, and when the wind again sprang up in the west they paid him the honors of a prophet with the idle zeal of people at sea, glad even of the distraction which respect for another's wisdom afforded them. But the wind suddenly backed from the west to the south, a strange yellow tinge spread over the purple sky, and faded to a dull gray, through which the sun burnt only the space of its rayless ball. The mercury fell, and the wind dropped again to a dead calm, from which it rose in sharp gusts that settled, as the day closed, into a heavy gale from the north-west. The ship drove before the storm for three days and nights. When the fourth morning broke she seemed to have been blown beyond its track; but one of her masts was gone; the sails hung in ribbons from the yards; the tangled and twisted shrouds swept her deck, and all but two of her boats had been carried away. The first observation possible since the storm began showed that she had been driven nearly a thousand miles to the south-east; but she was put upon her course again, and labored on till nightfall. At nine o'clock the passengers, huddled together in the cabin, heard a cry of "Hard down your helm!" and the ship struck with a violence that threw them to the floor; then, with a recoil, she struck again, with a harsh, grating force, and ceased to move. In this instant of arrest Fenton found his feet, and scrambled to the deck. The *Meteor* hung upon a coral reef that defined itself under the starlight in the curving line of breakers on either hand. The seas swept over her where she lay on her beam-ends, and at every rush of the breakers she pounded heavily on the reef. Beyond it was a stretch of smoother water, from which seemed to rise a low irregular mass of rock, forming with the reef a rude quadrangle. There was no hope for the ship, and no hope for her people unless they could somehow reach this rock. It was useless to launch the boats in such a sea; they tried once, but the boat filled as soon as it touched the water, and nothing remained but to carry a line, if it could be done, to the island beyond the reef. The captain called for volunteers, but the men hung back. It was not the time to parley; Fenton passed one end of the line round his waist, and plunged into the gulf under the lee of the ship. When he reached the rock, he found that two sailors had followed him, and these now helped him to pull in the heavier line attached to the cord, which he had made fast to a point of the rock. A hauling-rope was carried along this line, and, in the glare of the lights burned on the ship, they began to bring her people away one by one. A sailor mounted into the sling running upon the rope, with a woman or child in his arms, and was hauled to the rock and back again to the ship; and all the women and children were set ashore, even some poor creatures among the Chinese, before any of the men were suffered to land. These followed, till none of the passengers but the Chinamen were left. They stood huddled together at the bow, which had shifted round under the blows of the surf, and was hanging seaward; and the lights, burning now green, now crimson, now purple, showed them tossing their arms into the air, as if in some weird incantation, as they tried to free the wet joss-papers that clung to their fingers; the shrill supplications pierced through the roar of the breakers. The captain reported that he tried to make them understand how they were to reach the reef; but they would not or could not understand. He and his officers then flung themselves upon the line,

straining under the seaward lapse of the wreck; and at the same moment the vessel parted amidships, and the bow where the Chinese were grouped weltered back with them into the sea. The lights died out, and the ship's bell, which had been tolling dismally as she parted on the reef, suddenly ceased to sound. The broken hulk grew up once more in the dark, and the roar of the breakers rushed loud again upon the moment of horror that had been like a moment of silence.

When Fenton first touched the rock where all the survivors of the wreck were now gathered, it rose scarcely a foot above the water at the highest point, and by the time the captain reached it they stood knee-deep in the rising tide. An hour after midnight it was high-tide, and it was only by holding fast to each other that they could keep their footing.

The moon broke from the clouds, and one of the sailors whipped out his knife, with a cry of "Look out for yourselves!" and made a cut at something in the water. Fenton looked, and saw that the sea around them was full of sharks. He helped the captain form the men about the women and children, and they fought the fish away with cries, and thrusts of their knives, and blows of the splinters and fragments of the wreck which the breakers had flung to them over the reef, till the tide turned, and the most hideous of their dangers had passed for the time.

With the first light of day came their first gleam of hope. One of the ship's boats, which must have been carried around the line of their reef, came floating to them, bottom up, on the refluent tide from the other quarter. It proved to be so little injured that the captain and some of his men were able to put off in it to the wreck, where they found tools for repairing it and abundant stores. When they returned to the rock, they had a mast, with its sail ready to be stepped, lying in the boat, and several pairs of mismated oars which they had picked up outside. But it was the smallest of the boats, and the castaways counted each other with cruel eyes as it drew near. This rock was one of those dead atolls in which the Pacific abounds: a tiny coral isle, once tufted with palms and gay with perpetual green, which the sinking of the ocean's floor had dropped below the tide, and left lurking there with its guardian reef, a menace and a deadly peril to navigation. Somewhere within a day's sail there must be other islands of kindred origin, but with a certain area of dry and habitable land, which the boat might reach. But who should go, and who should wait her uncertain return? It was not a question of the women and children, nor of their husbands and fathers; but when all these had crowded into the boat, seven men remained upon the rock.

"Captain Rollins, there isn't room for us all in that boat," Fenton heard his voice saying; "I ask no man to share my risk, but I'm going to stay here for one."

"I don't ask any man to stay," said Captain Rollins. "I've left sixteen thousand dollars in gold—all I've got in this world,—on the ship, so as to keep the boat as light as I could; but, as you say, lieutenant, she can't hold us all."

There was a little pause; then three sailors, with a shamefaced avoidance of Fenton's eye, pushed past him toward the boat.

One of the passengers—an Englishman—rose up.

"My good men," he said, "you're surely not coming."

"Yes, we are," replied one of them, surlily. "Why shouldn't we come as well as you?"

"But the boat is too full *already!*" he expostulated. "You endanger the lives of the *passengers!*" he cried, with that respect for the rights of the traveling public which fills the Englishman when he writes to the "Times" of the inattention of the railway company's servants.

"Let the passengers get out, then," said the sailor. "*We* don't want 'em here." His joke raised a laugh among his fellows. "Come along, John; come along, Jake," he called to the seamen who still remained with Fenton.

"No; guess not," said one of them, quietly.

The matter-of-fact, every-day character of the details of the calamity, the unchanged nature of the actors in this tragedy of life and death, robbed it of reality to Fenton's sense, and made it like some gaudily represented fiction of the theater.

The figure of Giffen interposed itself between him and the captain who stood at the bow of the boat, in the act of offering his hand in farewell.

"Excuse *me*," he said, answering Fenton's look, "I'm going to stay. But I want Captain Rollins, if he gets back, to write to my brother, George Giffen, at Kankakee."

The harsh name, so grotesquely unrelated to anything that was there or then, awoke Fenton from his maze. Was there a world beyond these seas where there were towns and fields, chimneys and trees, the turmoil of streets, the quiet of firesides? His heart seemed to close upon itself, and stand still as the image of Helen sewing beside the little table on the library, in the way he always saw her, possessed him. The next moment, this in its turn was the theatrical vision, and he was standing on a point of rock in a wilderness of waters, the boat at his feet, and the

broken wreck upon a reef a stone's cast away. He took from his breast the water-tight packet in which he carried his dispatches, and wrote upon the back of one of them a line to Helen, with her address and a request that it might be forwarded to her. "Here are some letters," he said, handing the packet to the captain, with a light-headed sense of sending them to some one in another life.

"Why, bless you, man!" cried Captain Rollins, "I shall find land before night, and I shall be back for you here by this time to-morrow morning!"

"Yes, yes!" returned Fenton. "Don't stay, now," he added, impatiently. "Good-bye."

The four men on the rock watched the boat till she showed so small in the distance that they could no longer be sure whether they saw her or not; then they turned their eyes upon one another. Whatever the two seamen left behind with Fenton may have thought of his looks, he could not congratulate himself upon theirs. But he said:

"You are the men who followed me with the line last night."

"Yes, sir," answered one of them.

"You're not afraid, anyway," said Fenton, as if this were the most that could be said for them.

"I guess we get along," said the man. "I rather be on this rock than that boat, with so much people."

"What are you?" asked Fenton; for the man spoke with a certain accent and a foreigner's hesitation.

"I'm Fayal man; I live at Gloucester, Massachusetts; John Jones."

Fenton recognized the name under which most Portuguese sailors ship.

"And who are you?" he asked of the other, who was as tall and fair as the Portuguese was dark and short.

He grinned, and the latter answered for him.

"He don't speak much English. He's some Dutchman,— Icelander, I guess."

"Very well," said Fenton. "You know where we are, and what the chances are."

"Yes, sir."

"I reckon," said Giffen, "we can make out to worry along somehow till the boat gets back."

The sailors had begun to breakfast on the stores the boat had brought off from the wreck and left for them on the rock, and Giffen turned to with them.

"It wont do to count too much upon the boat's coming back," replied Fenton, suddenly hungry at sight of the others eating. "They may find land before night, and they may not find it for two weeks. At any rate, the sharks will be back before they are."

Giffen's jaw dropped, with the large morsel bulging his cheek.

"Come, man!" cried Fenton, sharply. "You'd better have crowded into the boat with the others if you're sorry you staid."

"I don't suppose I've got any great physical courage," said Giffen, in his slow, weak voice. "But I'm not sorry I staid. I'm ready to do whatever you say. I'm a born high private, if ever there was one."

"I beg your pardon," Fenton began, ashamed of his petulant outburst.

"Oh, that's all right," said Giffen, quietly. "But I'm in earnest. I'd rather follow some other man's luck, any time."

"I shall not ask you to do anything that I'm not ready to do myself," returned Fenton. "We must get out to the wreck," he added, including the Portuguese, "and see what we can make of it. And the sooner we get to it the better."

"I'm ready," said the sailor, closing the clasp-knife with which he had been eating; and the Icelander, who seemed to understand everything through him, pocketed his knife also.

They waded into the shoal water and swam round the stern of the ship where it overhung the reef, and tried to board her. But there was no means of doing this unless they passed the reef and ventured into the sea beyond, where they knew the sharks were waiting. They returned to their rock and began to gather up the pieces of shattered spars and planks that the rising tide was bringing in, and with such odds and ends of cordage and rags of sail as clung to these fragments they contrived a raft, on which they hoped to float out to the wreck when the tide turned once more. After the raft was finished and made fast to the rock they climbed upon it, and, launching upon the ebb, drifted out through a break in the reef and contrived to clamber up her broken timbers. They could see that this fragment of a ship must soon go to pieces under the incessant blows of the waves; and Fenton and Giffen made all haste in their search for tools and materials to strengthen their float, so that they might put to sea on it if the worst came to the worst. The sailors began ransacking the wreck with a purpose of their own, and in the end they all owed their lives to the rapacity which left no part of the ship unsearched; for it was the Portuguese who found wedged in among the shattered timbers of the hulk, where some caprice of the waves had lodged it, the boat that had foundered the night before. Every blow of the sea had driven it tighter into the ruin, and it was an hour's struggle in the dark, waist-deep in water, amid the bodies of the drowned Chinamen and just within the

line of the sharks that were preying upon them, before the boat could be cut out. When they pulled it up on the deck at last, it was in a condition that must have seemed desperate to less desperate men; but in this extremity Giffen developed the shiftiness of a dabbler in many trades, and his rude knack with the saw and hammer rendered the battered boat seaworthy. Fenton found a bag of flour, water-soaked without, but fresh and dry within; a few biscuit and some peas and beans, with which he provisioned her; and a shot-gun, with a store of water-proof cartridges, with which he armed her. With Giffen's help he fashioned a mast out of one of the broken yards and patched together a sail from the shreds and tatters of canvas hanging about it. The wreck was settling more and more deeply into the sea when they launched their boat at sunset and returned to the rock, where they made her fast.

The last man to come over the side of the ship was the Portuguese, who carried in either hand a buckskin bag.

"That's Captain Rollins's money," said Fenton. "Take good care of it."

"All right. I look out for it," answered the sailor.

With the refluent tide the sharks came back again. The dead Chinamen came with them, and seemed to join in beleaguering the castaways, crouching in their boat, which pulled at her moorings as if struggling to escape the horrors that hemmed them round. They had no water on the wreck, and a consuming thirst parched them. When the morning broke it showed them the surf beating over the reef where the ship had hung, and the sea strewn with its fragments.

"We can't stay here," said Fenton. "We must find land for ourselves somewhere — and water."

"That's so," admitted Giffen, with feeble acquiescence.

"I know they never come back for us," said the Portuguese. "I goin' tell you that, yesterday."

They cut their boat from her moorings, and ran lightly away before the breeze that carried them where it would.

The sky was again of the blue of the weather that had prospered the first weeks of the *Meteor's* voyage; again its vast arch was undimmed by a cloud from horizon to horizon; and it only darkened to a deeper blue, filled with large southern stars, when the sun dropped below the sea and the swift tropical night closed round them.

The castaways — voyaging none of them knew where, and trusting to rescue to whatever chance of land or passing sail befriended them, with the danger of tempest, and the certainty of starvation after a given time, before them — had already divided themselves into two camps, tacitly distrustful if not hostile; the sailors guarded between them the booty that they had brought from the wreck, and Fenton and Giffen watched by turns with the gun in their hands. But at day-break a common joy united them. On the edge of the sea a line of dark points printed itself against the sky, and, as they approached, these points rounded into tufts, and then opened into feathery crests of cocoa palms, with broken stretches of delicious verdure between the stems. The long white wall, that glistened in the rising sun like a bank of snow at their roots, expanded into a smooth, sloping beach; the deep surf flashed and thundered along the outer reef; and then the little coral isle, encircling its slumberous lagoon, took shape before their eyes. They tacked and wore to find a passage through the reef, and so, between the islets of the palm-belt, over smooth depths of delicate yellow and apple-green, they slipped into the still waters of the lake, and ran across to the white coral beach. They fell upon the sand, and scooped with their hands a hollow into which oozed a little water that they could drink; and then they kindled a fire with some matches that Giffen had brought from the wreck, and roasted the shell-fish the sailors found among the rocks.

"I think this goin' to be nice place, Cap'n," said the Portuguese, stretching himself face downward on the clean sand, when he had eaten and drunken his fill. "Plenty to eat, plenty to drink, nothin' to do. By-'n'-by some ship goin' to come here. We're all right, heigh?"

The little brown-faced man lifted to Fenton's face his black eyes, sparkling like a rat's with the content of a full stomach.

The Icelander laughed as if he had understood his shipmate, and while the Portuguese luxuriously dropped off to sleep, he wandered away, leaving Fenton and Giffen to prospect for the best place to put the hut they must build. "I don't like the way these fellows take it, exactly," said the latter. "They let themselves up pretty easy when it comes to a question of work," he added, with a mild sense of injury in his tone.

But the Icelander returned after awhile with a large turtle he had caught, and with his hat full of turtles' eggs which he had found in the sand. The Fayal man, when he awoke, joined him in a second foraging expedition, and they came back laden with fish and birds. John Jones showed himself skilled in primitive methods of roasting and broiling on hot stones. He opened the bag of flour, and

made a store of bread, which he baked in the ashes; and by the time Fenton and Giffen had finished the rude shelter they had been knocking together for the night, in the cocoa grove, he called them to a supper which a famine far less fastidious than theirs must have found delicious.

"Well, you *are* a cook," said Giffen, with the innate disrespect for his art which our race feels. "But you've got enough here for a regiment," he added, looking round on the store of provisions, cooked and uncooked, which was heaped up on the sand.

"Oh, plenty more where that come from," said the Portuguese. "They all good cold. I don't like cookin' to-morrow; want to eat and sleep for a week."

The Icelander had strayed away again, and they saw him climbing the palms, and strewing the eart beneath with cocoa-nuts. "Jake seems to be laying out for a week's rest, too," said Giffen.

The Portuguese laughed at the joke. "You better take that money up to your house, Cap'n," he said to Fenton.

"Where is it?" asked Fenton.

The Portuguese showed the two bags, where he had placed them, in a tuft of grass.

Fenton hesitated a moment. "You can bring it up with you when you get through here," he said, finally.

The Portuguese and his shipmate came carrying up the provision to the hut, after Fenton and Giffen had stretched themselves on their beds of grass.

"Cap'n," he said, waking Fenton, "here's the money. What we goin' to do with that boat?"

"Let her be where she is; nothing can happen to her," answered Fenton, heavy in heart and soul, and sodden with sleep, as he placed his hand on the bags the sailor had put down beside him.

"Yes," chuckled the Portuguese, "I guess nobody goin' to steal her."

The sailors did not come into the hut; they began to build a shelter of their own, and the noise of their work followed Fenton into his sleep. He had watched for three days and nights; he could not rouse himself from the deathly slumber into which he dropped again in spite of a formless fear that beset him; but he woke toward morning with this terror, which proved more potent than the fatigue that drugged him. The money was still there; the sailors were peacefully snoring in their hut; and Giffen lay asleep across the gun. He staggered down to look at the boat. It was safe where they had left it, and he returned to their shelter, where he watched an hour, as he thought; then he woke Giffen, and bidding him call him in his turn, when he could no longer keep awake, he fell asleep once more. It must have been his visit to the boat that suggested the dream which seemed to begin as soon as he closed his eyes. He dreamed that they were at sea again in the boat, and that they saw a sail in the offing so near that those on board, who did not see them, must hear them if they united in one loud cry. They rose up together for the effort, but their voices died in a gasp on their lips. Fenton burst into a groan of despair.

"My *Lord*, what's the matter?" cried Giffen, shaking the dreamer.

Fenton scrambled to his feet; the gold was still there, but the sailors were gone; he tore open the bags; they were filled with shells and sand. He rushed down to the beach; the boat had disappeared; in the horizon a sail, no bigger than the petal of a flower, flickered and faded.

It was sunset, and they had slept through the night and the whole day.

Fenton turned a look on his fellow-prisoner, which Giffen met with a face of ghastly self-upbraiding.

"My God," he said, "I fell asleep! I hated to wake you, and I fell asleep before I knew it!"

"It doesn't matter," replied Fenton, with the nerveless quiet of his despair. "Sooner or later, they meant to do it."

They turned blankly from the fact; it was days before they could confront it in speech; and then, with the conjecture that the sailors had set out in search of some inhabited land, where they could enjoy their spoil of the ship, their desertion remained incredible, unimaginable.

(To be continued.)

TO A HYACINTH, PLUCKED FOR DECORATION DAY.

O FLOWER, plucked before the dew
Could wet thy thirsty petals blue,
Grieve not—a dearer dew for thee
Shall be the tears of Memory.

H. C. Bunner.

ENGLAND AND IRELAND.

THE continued disorders of Ireland, the continued bitterness of her people against England and Scotland, may well astonish observers in other countries. They perceive that questions of race and nationality which had produced insurrections, sometimes successful, sometimes harshly repressed, have been, one after another, settled in various parts of Europe. Italy has been liberated from the Austrians and from her own anti-national princes. Poland has sunk into silence. The Hellenic and Slavonic subjects of the Sultan have most of them been delivered from the Turkish yoke. In all these cases, the difficulties of a solution seemed far greater than in the case of Ireland; yet in all these cases a solution, whether good or evil, has been found. It is now more than fifty years since, in emancipating the Roman Catholics, the English Parliament proclaimed its willingness to grant full civil and political equality to all classes of Irishmen, and to make them, in every way and for all purposes, citizens of the United Kingdom, eligible to the highest offices, entitled to share in its prosperity and freedom. Ever since then, the wish of most Englishmen has been to deal fairly with Ireland, and to repair, so far as may be, the faults and errors of the past. The circumstances of Ireland are not like those of any other oppressed nationality to which history can point. The press is free, and attacks the Government with a vehemence which English newspapers do not employ in the most exciting crises of English politics. Members are chosen who not only proclaim their hostility to the English crown, but tell the House of Commons to its face that their object is to bring it into contempt, and paralyze it by systematic obstruction. Yet, at the same time, Ireland—that is to say, the majority of the Irish people—feels herself a subject country, repels the overtures of England, demands sometimes a separate Parliament, sometimes complete independence. The English, though annoyed and impatient, listen to the complaints made, and go on passing laws intended to remove Irish grievances. These laws, however, are not received with satisfaction, and breed, not contentment, but fresh cries for further concessions. Meanwhile, political agitation is backed up by private crime; and a people proverbially warm-hearted and generous, among whom ordinary crimes are, or till quite recently were, less frequent and less revolting than in England or France, sympathize with and screen the perpetrators of murders and other outrages which excite the horror of the world.

The two peoples speak the same language, live under the same laws, have been brought into the closest relations by commerce and intermarriage for many generations; yet to-day a leading Irish politician tells his countrymen that the English in Ireland are a gang of brigands; and an English politician who was Irish secretary under Lord Beaconsfield's government says to his constituents: "Irish ideas of government are generally murder, sedition, and treason. Whatever is most anti-British will always be most popular in Ireland." The emigrants who settle in the United States, and often prosper there, retain the bitterest animosity to England, and many of them subscribe from their weekly wages to keep up the anti-English agitation. England is forced to keep thirty thousand soldiers and as many police as a garrison in the island within sight of her own shores. The problem is one which Americans can consider more fairly than Englishmen, who are themselves one of the parties concerned. But even Americans must find it so hard, in the midst of the cloud of recrimination and misrepresentation which covers the subject, to discover what is the real state of Ireland, and what are the true relations between her people and the English, that they may be willing to have a dispassionate statement laid before them, intended neither for Irishmen nor Englishmen, but to explain, so far as the writer can, what grounds of complaint Ireland still has; what are the obstacles to their removal; why these seem different to English and to Irish eyes; what part feeling and sentiment play in creating misunderstandings; what obstacles have delayed and still delay a settlement.

There are two opposite errors regarding Ireland into which observers in other countries are apt to fall, and one of which receives countenance in America from the somewhat too harsh judgment (if I may be permitted to express an opinion) which the part played by Irishmen in American politics has led many Americans to form of the Irish at home.

One of these errors is that the Irish are now simply vexatious, worrying England for the mere pleasure of worrying her; that the Irish parliamentary Nationalists are selfish

agitators who "have their own axes to grind," and who trouble the waters that they may the better fish in them; that the mistake of recent English policy has been in not dealing stringently enough with sedition and obstruction. This view errs by ignoring both the wretched economical condition of a large part of the Irish peasantry — a cause quite sufficient to produce discontent — and the substantial grounds of complaint which, as I hope to show, Ireland has had in the neglect of her affairs and the ignorance of them evinced by the English Parliament.

The other error lies in assuming, as those American politicians who, in the United States, take the chair at Irish meetings usually do, that Ireland is an oppressed country. She is not, in the ordinary sense of the word, oppressed. She has freedom of speech and equal laws, subject, no doubt, to certain temporary restrictions which Parliament has been repeatedly forced to sanction in order to protect life and property, and prevent insurrectionary movements. The freest governments are obliged to defend themselves; and though I do not deny that Parliament sometimes goes too far in granting these exceptional powers (it did so in 1881, and again [though in a less objectionable form] in 1882), it has done so reluctantly, and the executive has carefully forborne (in the case of the Act of 1882) to use several of the powers which it in fact received. To compare Ireland, as regards the conduct of her administration, with Poland under Russia, or Italy under Austria, is either dishonest or absurd. Rhetorical commonplaces about liberty and nationality have little application to the Ireland of to-day; the problem she presents is far too complex to be treated in this prompt and airy way.

The commonest explanation of the Irish difficulty is given by disparaging the Celtic race, and insisting that they are incapable of freedom and order. The doctrine of the natural inferiority of a race is the contemptible resource of indolent prejudice, which will not take the pains to examine historical problems to the bottom, or forgets in how many instances races which seemed inferior have risen, and those that seemed more gifted have sunk. It is a confession of ignorance, and needs no further discussion. Nor can much more be said for the theory that the misfortunes of Ireland are due to her physical character, her isolated position, and the dampness of her climate — a theory half humorously expressed by Disraeli when he said that the Irishman is discontented because he lives beside a melancholy ocean. In other parts of the world, disadvantages far greater have been overcome, and natural conditions far more favorable have not brought prosperity in their train. The true solution is obviously to be found in the history of Ireland, which has acted on her people, made them what they are, created their present relations to England and the rest of the world. But for the unhappy turn which the history of the island took, the Celts of Erin would have been long ago, like the Celts of Strathclyde, largely modified by Teutonic immigration, while also modifying the English, and both the people and their institutions would have so dealt with the country as to make the most of those natural resources, considerable in their way, which it possesses. In an article like this it is impossible to present even an outline of Irish history. But some salient points must be noticed, because on a comprehension of them depends the comprehension of the present feelings and aspirations of the people.

It is often said, particularly by the Irish themselves, that the sufferings of Ireland arise from her being a conquered country. This, however, might be said of nearly every country in Europe, for nearly all have been overrun by some invading race which has established its dynasty, perhaps also its laws and its language, among the aboriginal inhabitants. England herself has been in this way thrice conquered. It would be more true to say that the misfortune of Ireland was to have been only half conquered, and even that not till a late date. The so-called annexation in the time of King Henry the Second was merely the establishment of a small English colony or garrison on the east coast of the island; for the Welsh and Norman adventurers who gained lands in other districts soon became assimilated to and absorbed in the native population. Not till the days of Elizabeth and James the First were Ulster and Munster reduced under English rule, and the operation was so imperfectly performed that it had to be repeated by Cromwell with a stern thoroughness which nothing but success could have justified. Nor did success follow. Elizabeth and James had reduced about half the island into a sort of order. Cromwell subjugated still further, attempting to drive the untamed mass of aborigines into the wilds of Connaught, and parceling out the rest, or such parts of it as lay at his disposal, among English colonists. But when the Stuarts returned to England in A. D. 1660, this settlement was in great measure overthrown. The native proprietors did not, indeed, regain all their former estates. But the dispossessed people flowed back to their former seats; the fabric of order was

loosened, and the country relapsed into confusion till the final conquest, thirty years later, under William the Third.

With that final conquest the catalogue of wrongs and blunders which we call modern Irish history begins. Up till this time the only serious grievance had been the land-seizures of the English settlers, and the extinction of ancient Irish land-rights and customs by the feudal law of England. There was little or no feeling of Irish nationality or of loyalty to their faith among the chieftains who resisted Elizabeth; they were fighting for their territories, for their personal sway, for the pleasant lawlessness of a half-barbarous life. But, during the fierce civil wars of the seventeenth century, feelings of race hatred and religious hatred grew up, which were deepened, strengthened, justified, by that system of penal laws which was intended to bind the Protestant and Saxon yoke forever upon the necks of the native population. Race hatred left to itself might have subsided, and the sense of land robbery, when the chance of recovering lost property had died away, might have become first a sentiment, and then a memory. But the penal code which subjected the Roman Catholic to the Protestant in every relation of life was a constant sore, which he could not for a moment forget, and which wounded his pride as well as his interests. Religious divisions need not destroy national unity. Even in the last century, English Roman Catholics were patriotic Englishmen; and in Germany religion had ceased to be a source of bitterness. It was the way in which the penal code made Protestantism a source and a badge of legal and social supremacy, excluding the Roman Catholic from a whole variety of private civil rights as well as political privileges, that embittered the minds of the aborigines, made them feel themselves a distinct nation and an oppressed nation, sanctified their hatred of England and English law and the dominant race by giving it the color of a loyal devotion to the faith they professed and the priesthood which witnessed to it under persecution. When the law provided that the son of a Roman Catholic father should, by embracing Protestantism, dispossess his father and exclude his Catholic brothers from inheritance, it gave to political hostility that far keener bitterness which private and family wrongs implant. There was thus erected a fourfold barrier between the native Irish and their English conquerors —first, the race hatred of the Celt for the Saxon; next, the resentment of the ejected landowner against those who have dispossessed him; thirdly, the indignation of one debarred from political rights against his fellow-subject who enjoys them; and lastly, the animosity of the Catholic against the Protestant.

These feelings had three generations of Irishmen to work on before the relaxation of the penal laws began. They operated primarily in Ireland itself to make out of her inhabitants two distinct nations, practically distinct in blood, but legally distinguished by religion. Meanwhile other causes were exciting the wrath and bitterness of Irishmen of both these two nations against England regarded as a foreign power. The English Parliament framed its commercial legislation with a view to prevent Ireland from competing with English manufactures; duties were laid upon Irish products coming to England; Irish revenues were jobbed away in finding places or pensions for political adventurers or personal favorites too bad to be provided for even in the corrupt England of that day. Galling disabilities were imposed on the Presbyterians of Ulster, the most industrious and progressive part of the population, and hitherto faithful to the English connection. These same Ulster farmers complained bitterly of the exactions of their landlords who had, it was alleged, broken the understanding on which they had migrated from Scotland; but no redress was attainable from England, whose Parliament cared nothing for Irish affairs. Meantime, the Irish Parliament was impotent, being unable to legislate except with the consent of the English Government. The ignominious position of a subject country in which they found themselves thus began to exasperate even the Protestants of Ireland. Having now ceased to fear the Roman Catholics, they became disaffected toward England; they agitated for political and commercial equality.

Partly because she was pressed by her war with the United States and France, partly from a sense of the injustice she was maintaining, England yielded. In 1782, freedom was granted to the Irish Parliament, already illustrated by great orators like Grattan and Flood; and the life it enjoyed during the next eighteen years was vehement enough to rouse the country to a sense of national existence. It seems curious now that this sense should have been first evoked by that Protestant and Saxon garrison which now holds so tightly to the union. Meantime other forces were at work to create difficulties and disorders. The sufferings of the peasantry, and their knowledge that no relief could be had from the law which was framed and administered by the dominant landlord caste, had created an epidemic of crime and

outrage over many parts of the south and west; Whiteboys and other lawless bands made their appearance; secret societies—a plague that has never since ceased—were organized for objects which it is hard to condemn, however mischievous the means employed. The Scoto-Irish Presbyterians of the north, after an unsuccessful rising, had begun to emigrate to North America, particularly to the Middle States, and were among the hottest foes of England in the War of Independence. At last these three elements of disaffection,—the Nationalists among the educated class, the discontented northerners, and the wretched peasants, led to some extent by their priests,—joined, under the impulse of the French Revolution, to form the great conspiracy of the United Irishmen, which burst into flame in the rebellion of 1798.

We all know the story of that unhappy insurrection, condemned from the first to failure by the want of leaders and of cohesion, and by the apathy of France. It would have been better for both Ireland and England had it been either more or less formidable. If it had succeeded so far as to hold the English for a time at bay and obtain recognition as a belligerent force, peace would have been ultimately settled on fairer terms, and Ireland might have escaped another generation of servitude. If it had been feebler and more easily suppressed, the ruling caste would not have taken so ferocious a revenge. Catholic emancipation, which Pitt had desired some years before, would not have been so long delayed, the union with Great Britain in 1800 would not have been hurried through under such odious auspices. For the next nine-and-twenty years,—till O'Connell extorted political rights for the Roman Catholics,—the condition of the island was deplorable. Outrage had now become the familiar resource of the peasantry, harsh coercion acts which established martial law or suspended *habeas corpus*, the weapon of the government, while the apparent representation of Ireland in the British Parliament was a mockery, since only Protestants could elect or could sit, and even the members chosen were too few and personally (of course, with some brilliant exceptions) too unworthy to exercise any influence for their country's good. The British Parliament and the English law seemed to govern; but, in reality, the island was ruled by the same insolent, reckless, thriftless caste of landlords and their dependents, who were all that men may be expected to become when ignorance and violence are checked neither by law nor by any opinion from beyond their own circle. It was a strong race, that of the Irish Protestants, and it has produced some remarkable men. Its faults were largely due to its position and surroundings. But they have proved fatal faults to the country.

With the passing of the Emancipation Act, in 1829, a new era seemed to open. England had repented of her past wrong-doings; justice and friendship were henceforth to guide her. Unfortunately, the worst often comes after efforts to make things better have begun, partly because it is not till then that the results of previous error are fully seen, partly also because the revengeful feelings of those who have suffered oppression do not find vent till they feel themselves stronger and freer. England expected that the Irish would be grateful for her tardy act of justice, and has not yet got over her surprise at finding that they are not in the least grateful, but more troublesome than they were before. The events of the last fifty years, since a reformed Parliament has had to deal with Ireland, are in everybody's knowledge, so that no historical outline of them need be given. What has been said may have been enough to show how long a time it had taken to form Irish feeling as it stood on the morrow of Emancipation,—and how many different springs of tears and blood had combined to make it bitter. There was the resentment of the priesthood first, and also of their flocks, against the Protestants who had appropriated the ancient churches, and forced them to pay tithes to heretical pastors. There was the feeling, perpetuated in a dim, dull way from generation to generation, that the land which the Saxon now owned had been the land of the natives; that the right his law gave him to turn the tenant off was a wrong not less foul because it was old. There was the memory of countless acts of insult and tyranny perpetrated by the landlord class,—not so much by the large proprietors, for they lived in England or in Dublin, as by their relations and dependents, their agents and bailiffs,—and all that loose throng of idlers that hung round the Irish squire of sixty years ago. There was, among the better educated, shame and wrath at the misery and squalor and ignorance in which the great mass of their countrymen lived, and which, not quite justly, but not unnaturally, was laid to the charge of a government which neglected its humble dependency. And lastly, there was just springing up, but destined to grow far more potent and terrible, the feeling of Irish nationality,—the desire to be a people, an independent people, one among the nations of the world, and not the mere satellite of stately and contemptuous England.

All these sentiments, acting some upon one class only, some upon all, have gone to form the present temper of the bulk of the Irish people, of those whom one may call the aboriginal nation, as distinct from the Anglo-Scottish immigrants. But it was some time before they fully revealed themselves. At first, the people were too depressed, too little conscious of the new position they had attained, to express their feelings or give effect to them, whether by agitation, or by electing representatives after their own heart. The sentiment of nationality, which was comparatively new and feeble in 1832, has wonderfully developed itself since then under the example of its successful assertion not only in Italy, in Germany, but even in small peoples like the Bulgarians or Roumanians, or in remote regions like Iceland. And the habit of obedience to the ruling caste was so rooted that it was not until the Ballot Act, passed in 1872, had set the voter free from his fear of the landlord, that members began to be returned who belonged to a new type,—men in whom the vindictive bitterness that had accumulated during past generations found expression more vehement than the bulk of the people would really have given to it, but which by its expression intensified that bitterness and further stimulated the anti-English sentiment.

All the elements of hostility which I have enumerated have been steadily converging to make up the present nationalist Irish party. The Tithe war of 1831 was purely a social or economical movement among the peasantry, with hardly a political side. The Repeal movement under Daniel O'Connell, the Young Ireland movement under Davis, Duffy, William Smith O'Brien, John Mitchell, were political movements purely. The latter more particularly was largely sentimental, and had little root among the people. It was led by enthusiastic men of literary tastes, who found their fellow-countrymen too ignorant to enter into their views, too unorganized to give them substantial support; while the priesthood were indifferent, seeing no gain to their religion from these republican demonstrations. Some sixteen years after the abortive rising of 1848 came the Fenian movement, wider and more dangerous, because conducted by persons who more largely belonged to the humbler class, because based on a system of secret societies which ramified through the towns of England as well as of Ireland, because largely organized from America and by men who had gained some experience of fighting in the American Civil War; finally, because it promised a tangible gain to the peasantry in the expulsion of the Saxon colonists and the redivision of the land. Next followed the Home Rule agitation, comparatively moderate in its aims, constitutional in its methods, supported by many persons of good social standing, Protestants as well as Catholics, conservatives as well as liberals, yet of course drawing to itself some sympathy from those revolutionary men who welcomed every attack upon the English connection. But the different elements of the Home Rule party soon fell asunder. Two extreme sections began to act for themselves. The one, consisting of a small group of members of the Parliament of 1874, enlarged to more than thirty in the Parliament of 1880, devised, or rather developed and extended (for it had been invented by some English Tories in 1872) the system of parliamentary obstruction. They continued to arrest the progress of English and Scotch business in the House of Commons in order to force the legislature either to devote itself to Irish business, or else to make over Irish business to an Irish Parliament. The other section, perceiving that no agitation could be really formidable which did not enlist the peasantry by appealing to their material interests, and to that interest which was the oldest and deepest in their minds, founded the Irish National Land League. Its programme, "the land for the people,"—whether that mean merely fixity of tenure at a reduced rent or the extinction of landlords altogether, with every farmer the owner of his farm,—was far more seductive than any that had been publicly proclaimed before.

While the more moderate Home Rulers found themselves drawn toward the English Liberals, an alliance was effected between the Land League—strong among the masses—and the extreme parliamentary party. The stream of political agitation was swelled by the turbid torrent of social revolution. These were the steps by which the position of 1881 was reached, when, under the influence of passionate scenes in Parliament and agrarian outrages reported from two-thirds of Ireland, the crisis took place which produced the Coercion Act and the Land Act, on the morrow of which, not yet knowing all that they will bring forth, Ireland and England now stand.

During these fifty years, however, while Irish discontent was gathering force, and its streams were uniting into one channel, that policy of reconciliation which had begun with Catholic emancipation had not ceased to be applied. The tithe grievance was dealt with in 1833. Several bishopries of the Established Protestant Episcopal Church were suppressed in 1833. A system of national education was

established while England as yet had none. The Queen's Colleges and Universities, intended to supply unsectarian university education, were created, and Maynooth College founded for the education of the Catholic priesthood. In 1869, the Protestant Episcopal Church was disestablished and partly disendowed, against the vehement opposition of the Church of England and influential sections of English society—a large concession to make to principles of abstract justice. In 1870 another act was passed, which recognized rights in the tenants to the good-will of their farms, rights whose existence up to that time the Legislature had constantly denied, and which seemed, to many English land-owners, to endanger the security of English landed property. All these, it may be thought, were so many messages of peace and amity sent by the British Parliament to Ireland. Why have they not produced more effect—why not, at least, some effect? Why did they not mollify the feelings of the Irish, assure them of the good disposition of Britain, suggest to them a policy of temperate constitutional agitation, such as any class or interest in Great Britain pursues when it conceives itself aggrieved by some defect in law or administration? Have all these acts of justice been thrown away, and might Britain have equally well, for her own comfort and security, turned a deaf ear to every demand that reached her across St. George's Channel?

The obvious answer is that feelings which it has taken centuries to implant are not forgotten in a few years, even under the best influences. If you have been scolding and beating a child ever since it left the cradle, you must not look for affection and confidence as soon as the stick has been thrown away. But this answer, which people in England have grown tired of, does not explain the whole matter. There must be other reasons for the continued misunderstandings of the two countries—for the unsoftened asperity of the Irish National party. Take an act like the murder of Lord Frederick Cavendish and Mr. Bourke last spring—an act unparalleled in the previous history of Ireland—unparalleled, one may almost say, in the history of modern Europe; for the victims of political assassination in Russia, or Spain, or Italy, or even Turkey, have been persons against whom some personal animosity might be felt, who were either, like the Czar Alexander II., the emblems and heads, or at least the active agents and ministers of a hated system, who might have concentrated its obloquy upon themselves by some official act. But here the principal victim had and could have had no personal enemy; he had not entered on his duties; his mission was to open the prison-doors, to conciliate by gentleness. The crime is indeed not to be charged on the nation, but on a few fierce and misguided men. But there were large classes in Ireland whose satisfaction was scarcely concealed, and many in America who openly applauded. Such an event is only the most conspicuous illustration of a state of feeling between the countries, or rather among the Irish Nationalists toward England, for which reasons must be sought in the present as well as in the past.

If we attempt to discover these reasons, we shall find some of them in the character and attitude of the people and Government of Great Britain; others in the temper and imagination of the Irish. I will begin with the former.

The English government of Ireland is still practically a foreign government. The English may say that it ought not to be so, cannot be so, because after all the two islands form one kingdom, owe allegiance to a queen who is as directly queen of the one as of the other, are governed by a popular assembly, in which representatives of Ireland—representatives more numerous than her population and wealth entitle her to—sit and vote and speak freely, and more than freely. Nevertheless, people in Ireland still think of and talk of the Government, not as their Government, but as "the English Government." It seems to them an external power, set in motion by forces they do not control, conducted on principles which may or may not be good, but which are not their principles. The Irish peasant or small tradesman feels it foreign just as Hungarians and Italians felt the Government of Austria foreign, five-and-twenty years ago; as the upper classes of Poland feel that of Russia still. You may tell the Irishman that the Government is his own, conducted by his Parliament: he thinks it foreign none the less. The English do not understand this, do not believe it. They go very little to Ireland, but when they do, they hear a language the same as their own, see the same soldiers, and in the larger towns the same constables, enter the same law-courts, pay in the same coinage, travel on the same railways, pursue the same field sports, meet at dinner persons of their own class with the same prejudices and tastes, and remark little difference between the two islands, except that the people are (as they say) more ragged, more amusing, more untruthful. They do not see why Ireland should not be just as loyal as Scotland, where they feel themselves perfectly at home although the laws and religion are different. The Englishman has hitherto always assumed

that he and his habits and ideas and laws are the normal and natural ones, and has applied them accordingly. The laws of Ireland, and nearly the whole (for of course there are some differences) of her administrative system, have been transplanted bodily from England, where they had naturally grown up, and been set to work in a country whose conditions were originally quite different, and have never yet adapted themselves to the English exotic. The English law of land, the Anglican Protestant Church Establishment, were only the most salient instances of the method pursued in governing Ireland according to English ideas; and though these two are gone, there remain other institutions ill-suited for Ireland, and which she would never have created for herself.

But this is not the only ground on which the Irish allege that they are governed from abroad. The two heads of the Executive—the Lord Lieutenant and the Chief Secretary—are nearly always Englishmen, or if, as in the case of Mr. Chichester Fortescue, Irish-born, yet Englishmen to all intents and purpurposes, by education, by connections, by ideas.* I do not contest the reasons which might have been advanced against the appointment of Irishmen to these posts of late years, though however few the suitable Irishmen, none could well have been more unsuitable than two of the Englishmen who have served as Chief Secretaries within the last twenty years. I only observe on the fact, which Irishmen fairly point to as a proof of subjection. However, the chief ground of complaint is found in the British Parliament. It is the Parliament of Ireland as well as of England. Irishmen make laws for England and Scotland with as full a right as Englishmen and Scotchmen for Ireland. The vote of an Irish member is as effective to turn out a ministry as that of a member for Manchester, London, or Edinburgh. Where, then, is the grievance? In this: that the Irish members are a comparatively small minority, whose votes have no more weight upon Irish affairs than those of any English or Scotch member who knows nothing and cares little about those affairs. If the Irish members were ever so united (not that they ever are united), their wishes could be easily overborne by a minister who need only call in his English and Scotch majority. Ireland requires, say the Irish, almost the whole time of Parliament. There is so much misery among her people to be remedied, so many abuses in her administration to be exposed, so many changes in her laws to be made, that whole sessions ought to be devoted to her. But the English and Scotch members will not give the time. "Ireland," the English say, "has less than one-sixth of the members of the House of Commons, only one-seventh of the population of the two islands. Why should she engross more than the same proportion of the time of Parliament? During the last six years Ireland has certainly had far more than her fair share of the public time. But this has been owing partly to her disordered state, partly to the systematic obstruction of a section of Irish members. Until that obstruction began, she was disgracefully neglected. English members were bored by Irish questions, about which they knew nothing, and of which nothing seemed to come. They lounged into the lobbies, and flocked back at the sound of the division-bell to vote as their party leaders told them; they were always willing to stifle an Irish debate.

This state of things galled the Irish members, and its existence is some justification for the obstruction which they have practiced. It was, of course, impossible for the House of Commons to submit to such a perversion of its rules and interruption of its business; but without obstruction, the Irish members might never have got the Land Act. Irish questions would have been thrust aside as they had been so often in time past. Nor is it only the indifference; it is also the ignorance of the British Parliament that is arraigned. Acts are passed for Ireland, administrative policies are adopted in Ireland and defended by the Government on the floor of the House of Commons, which those who know Ireland know to be mistakes, sure to end in failure. If they related to English affairs, English members would be interested; one could talk to them in private, one could appeal to them in debate; the newspapers would be used; public opinion would check an erring ministry. But where the mistake relates to Ireland this cannot be done. Since they do not understand Ireland, the English and Scotch majority deliver their votes into the hands of the Government, the Government delivers itself into the hands of its Chief Secretary, and even if an English member here and there is found who, knowing something of Ireland, can protest against the blunders he sees the Chief Secretary committing, he protests in vain, for he finds no more support in English public opinion or in the press than he does from his uninformed brother members.

Thus a great deal of the government of Ireland, and most so in troublous times, is government by one man, Lord Lieutenant or Chief Secretary. He is usually an able

* The nobility and the upper gentry of Ireland, it need hardly be said, are substantially English.

and a conscientious man (at present, we have exceptionally high-minded and capable men filling both these places); but, after all, this is not free government or self-government, such as England boasts to have taught the world. It is not the way in which England or Scotland is governed. It is the rule of a dependency through an official,—responsible, no doubt, but responsible not to the ruled, but to an assembly of which they form only a sixth part. When any grievance is felt in England, be it by any part of the country or by any class, or trade, or profession, a clamor is soon raised. Deputations wait on the ministry, and members are plied with letters by their constituents. Public meetings are held and reported. Some leading newspaper is sure to take the matter up and make the political world familiar with it. Those who suffer are all around those with whom the remedy lies, and can approach them and influence them in a hundred ways. So, when the matter comes before Parliament, the declaration of a minister is not accepted as conclusive. Members vote as their convictions, or their fear of their constituents, decide them; and the ministry yields or is defeated. Some years ago, the English trades-unions complained of the common law of conspiracy, which, as they said, pressed harshly and unjustly on them. At first, the Government and the upper classes generally turned a deaf ear; but, by persistent agitation out of doors, for they had at first little parliamentary support, they carried their point, and had the law changed in their favor. Neither members nor ministers could afford to ignore the trades-unionists, in the midst of whom, so to speak, they lived. But the Irish peasantry are far away in a different island; their complaints, their sufferings, their aspirations, have not touched the English members directly. They have at most been read about, as one reads the stories in a book of travels.

"It is to this same cause," pursue the Irish, "that we trace the vacillation, the uncertainty, the want of consistent principle, which has marked the policy of English governments and parliaments toward Ireland. Your ministry coquets with the Roman Catholic hierarchy, believing that by keeping it in good humor,—that is to say, by making constant concessions to its claim to control education,—you can best keep the country quiet. But every now and then Parliament takes the matter up, refuses the concessions which have been virtually promised, creates a general sense of insecurity. At one time you are severe, passing stringently repressive acts; at another you let these acts expire, and give a tacit encouragement to sedition. These are just the kind of changes which one must expect in the foreign policy of a State, because Parliament and the nation cannot be always attending to foreign policy, and when they return to it after an interval, are apt to think and command in a different spirit from that of some years before. But it is not what ought to happen in domestic policy. Your Irish policy is, therefore, more foreign than domestic in its character. You are not governing yourselves, but a people outside yourselves, in short, a dependent country. Say what you will, there are two nations, not one nation. Every debate in your Parliament shows it, and most of all, a debate in your House of Lords, where there is not a single exponent of the ideas and sentiments of the great mass of Irishmen. Yet the House of Lords has the power of rejecting measures intended for the benefit of Ireland which nearly every Irish member in the House of Commons has approved. It does not fear to exercise that power. It exercised it in 1880 by rejecting the Compensation for Disturbance Bill, a rejection from which all the subsequent disorders of the country have sprung. How would not the Liberal party in England have resented such a piece of audacity on the part of the Lords, if the bill had been for the relief of English sufferers! You would have threatened the House of Peers, you would have sent the bill up again, and dared them to reject it. But as Irish tenants were the victims, you took it coolly. Mr. Forster fired some shots in the air against the Lords, the Radicals cheered him, and there was an end of it. But not an end of the mischief, for from that hour agrarian outrages began to increase. The essence of a constitution and government like that of the United Kingdom is, that the governed, the people, are also, through their representatives, the governors, so that whatever evils they feel in the one capacity they can rectify in the other. This is why free government, good government, self-government, are synonyms of one another, because experience has proved that no man, or assembly, or nation, can be trusted, in the long run, to govern others so well as they will govern themselves. Now the government of Ireland by English ministers, by a Parliament one house of which is entirely, and the other five-sixths, English and Scotch, is not self-government. Hence it is that we still feel your legislation, even when it is liberal and well-intentioned, to be foreign legislation, and ourselves your subjects."

I have endeavored to state the case as a fair-minded Irishman, rather than as an Englishman, would state it. Unquestionably there is much truth in such a view. One

need only listen to an Irish debate in the House of Commons to recognize it. And one must further admit that the English are not merely foreigners, but by no means gracious and agreeable foreigners, to deal with. In spite of their many virtues, partly because of some of their virtues and especially of their passion for improving people and things, the English do not make themselves liked by other nations, not even in India, where they are honestly doing their best for the natives. They are too stiff, too dry, too unsympathetic, too much disposed to make their own notions and customs the universal standard of right. Toward races which they think their inferiors they are less often cruel and far less often unjust than most European peoples. But they are contemptuous, or at best, condescending. They do not allow the subject to forget that he is not only a subject but an inferior. Their very indifference to his opinion of them is the most constant evidence of their pride. Between them and the Irish there is a sort of incompatibility like that which exists between the German and the Slav. It is true that they do not hate the Irish as the Germans hate the Slavs, and as the Lowland Scotch hated the Celtic Highlanders, even so recently as in the days of Thomas Carlyle's youth. An Englishman is not sensible of any antipathy to an individual Irishman; and it need not be said that an individual Irishman has every chance, and uses it, of success in England. In the professions of arms and law and medicine, in the church, in literature and science, many of the leading men of modern Britain are Irish by birth or education,—real Irishmen with their Irish quality, perhaps even their Irish speech bewraying them. But for Ireland as a whole, or for any group of Irishmen associating themselves as Irishmen, the English have a feeling which, if not dislike, is at least distrust, and which, though hardly to be called contemptuous, is certainly not respectful. An Irishman who is content to be even as an Englishman is received on the same footing. But Irishmen who obtrude their Hibernian character and nationality are ill-regarded. Then local patriotism is thought ridiculous. "What have they to be proud of?" says the Englishman; "why cannot they leave that nonsense alone, and be satisfied to be citizens of this great United Kingdom? They are not fit for self-government, and would go to ruin if left to themselves. They must be treated like children. Why cannot they be happy, with such a kind friend as England to look after them; why are they not more grateful for all she is doing for them?" The restlessness, the vehemence in language, the exaggerativeness of the Irish temperament, its instability compared with his own, even its gift for coaxing and pleasing,—all repel the ordinary Englishman. He cannot conceal his distrust, and the Irish take his distrust, as it is often accompanied by brusqueness, to mean more than it does mean. They are irritated by the English want of suavity in a way which surprises the English, sensible of their good intentions and not understanding how much mere manner counts for, between nations as well as between individuals. A patriotic Irishman, even if he has nothing to complain of personally, becomes indignant on behalf of his nation; feels the English foreigners, resents their interference just because it is that of foreigners, and nurses his nationality more than ever, as an ardent mind is most loyal to a friend just when the world runs him down. I have heard Irishmen who were themselves bitter opponents of the so-called National party, hot Tories and Protestants, confess that they hated the English, and would like to be rid of them, were it not that they knew that in an independent Ireland their own party and religion would be overpowered. The sense that England treated them *de haut en bas* was intolerable. No wonder then that this feeling among the less educated masses, who have been fed for years with denunciations of England, and told that all their misfortunes are due to her, makes them think and call the government which is carried on in the name of the Queen and Parliament a foreign government.

If it were only this, if it were a purely English government, the case might be better. Foreign rule, such as was the rule of the Austrians in Italy, need not wound men privately, but publicly only. So far from setting class against class, it has a tendency to bring classes together, by giving them the bond of a common national feeling against the stranger. But the so-called English government in Ireland is the rule not merely of England, but of the English part of Ireland,—of a dominant caste, English by origin, Protestant by religion,—who in time past enjoyed a monopoly of political and civil rights and so abused it as to bring the people's hatred, not on themselves only, but on England also whose power they were suffered to wield. To the mind of an Irish peasant or tradesman, the Government is not a distant abstraction, which, in return for a light tax, gives him the protection of the law, not an imposing embodiment of the unity of the nation; it means the squirarchy, the landowning and locally dominating class, to whom he pays rent, who are justices of the

peace, who are connected by social or family ties with all the other powers that be, and who are still able to influence those powers for his evil or good. In time past, the peasant had much insolence and much oppression to suffer from the squires and their dependents, there being no such sympathy and friendliness between him and them as in England gives a genial character to the relation of landlord and tenant. He knows that things have changed now. The Irish landlords are nearly always Tories, and since 1870 great has been their bitterness against the Liberal party which disestablished the Protestant Church and altered the Land Laws. The peasant sees that those who were once secure in their strength are now angry and alarmed. He perceives that there is a power above the squire which no longer supports him as of yore. He thinks this change is due to agitation, to the fears the English have begun to entertain, and he is encouraged to assume a bolder attitude. But the Government is still identified in his mind with the class through which it approaches and deals with him,—the class which furnishes the paid as well as the unpaid magistrates, the judges, the bulk of the officials. The rancor which he feels toward this class—a rancor stronger now than it was when they deserved it far more (because brutality is less resented by a serf than arrogance by a man swollen by newly won equality)—extends itself to the Government, and England has the misfortune to incur a double inheritance of hatred, that of the foreign power which has conquered, that of the ruling caste which has tyrannized at home over the poor. That she has identified herself with this ruling caste, legislated in its interest, allowed it to make her odious, all this belongs rather to the past than to the present. The existing generation of Irish landlords are far better than their ancestors, and have suffered heavily for the sins of those ancestors; much of their power is gone and yet more may be lost. But the English Government cannot rid itself of the association with them which the people have formed, because most of those who combine education with loyalty to the English connection belong to that caste, and are therefore the inevitable officials. Herein, therefore, England can hardly be blamed. Nor is it the fault of the present generation of Englishmen that Ireland has to be governed as if her people were one with the English, when history has made them different. That which may be charged as a fault on the English is that they have not, in the fifty years that followed Catholic emancipation, known or cared to know the truth about Ireland, and that when this truth has been brought before them, they have usually ignored or forgotten it. When Parliament has bent itself to Irish questions, it has done so because the pressure from Ireland — sometimes the increase in agrarian crime, sometimes the prospect of each successive insurrection, sometimes obstruction in the House of Commons — forced it to do so. Every concession has been extorted, has come too late, because the demands of the agitators have already gone further, has lost grace, because not spontaneous, has been incomplete, because always mutilated by the House of Lords, has seemed due not so much to reason and justice as to fear and weariness. On each occasion, over and above any arguments in favor of the measure on its merits, the argument has always been heard, and has been most really potent, that Ireland is so full of discontent and sedition that something must be done to appease her. Thus agitation has been encouraged, and the Irish have been taught that the true way to fix England's attention is by outrage and sedition. Every time their demands are granted they are warned that this is the last time; but they do not believe the warning, it has so often been given before. For this neglect as well as for that strain of haughtiness which stings the Irish, England will doubtless incur the censure of history. But what England? There are two Englands as there are two Irelands, though less embittered against each other. Liberal England (I speak generally, for the view is the view of all Liberals, though that which predominates in this party,) admits many of the principles for which the popular party pleads, has little sympathy for the landlord caste, and still less for Orangeism, is willing to go a long way toward granting every demand which is not inconsistent with the unity of the empire. Tory England (again speaking generally) holds that all our Irish difficulties are due to our weakness, that consistent firmness would have quelled long ago a disaffection which feeds and thrives upon concessions. Discontent is due to agitation; agitation is due to the indulgence it receives from Liberal ministries, who find it easier to grant than to refuse, who think that the masses are always right, and the landowners always wrong. When a Tory Government yields—which it sometimes does—it alleges that the behavior of its Liberal predecessors has compelled it; when a Liberal measure proves insufficient, the defence is that the Tory party or the House of Lords mutilated it in its passage. Between the two sets of views, alternately mounting into

power, as the majority shifts this way and that, English policy toward Ireland loses vigor and definiteness, and effects neither what persistent firmness might do, nor persistent liberality. Each party finds in the Irish policy of the other a field for political attack, and under a system of party government, what else can be expected? Yet no one can doubt that as the resistance to Irish demands has always come chiefly from the Tory party, so it is the great strength of that party which has made the successive acts of concession so tardy and so incomplete. A leading Nationalist member said not long ago, that if it were not for the Tory party, the Irish question would be settled in a session. This is going too far. But it is unquestionably the existence of a landed aristocracy in England, allied to and naturally sympathizing with the landed aristocracy of Ireland, that has made England generally take her ideas from, and espouse the cause of, that ruling caste which the Irish masses hate.

So far I have tried to set forth those elements of mistrust and difficulty between the Irish and England which are due to the position or character of the latter, and to the incidents of her government. Let us now look at the matter from the other side, and see what England has to complain of in the present or recent temper and conduct of the Irish. What is there in them which prevents a *rapprochement*, an understanding by which the peoples may get on amicably together? The Irish would not themselves deny that they are hard to deal with, and American readers will not require much proof of that proposition. But in what way and for what reasons?

They are, in political matters, unpractical. Considering what an active part they play in American politics, not to speak of their parliamentary feats in England, it may seem absurd to call them an unpolitical nation. But they do want some of those qualities which have made the English and the Americans succeed in working free institutions,—self-restraint, moderation, a sense of the relative importance of different aims, a willingness to see what can be said on the other side, a preference of solid men and solid objects to brilliant declaimers and seductive visions. It is no reproach to them to be in these respects deficient, for few races have possessed these gifts, and even in England and America it is by a long experience of freedom that they have been developed and matured. The Irish people had no chance of forming habits of self-government before 1829. Till then politics meant, for them, conspiracy. Since then, while the habit of conspiracy has unhappily survived, open agitation has been added. For the present generation, politics have consisted in agitation, in perpetual opposition, complaint, denunciation. No popular leader has held any official position, has been called upon to put forward a positive scheme, has learnt by experience what the difficulties of legislating and governing are, has had himself sobered by the sense of responsibility. The Irish ideal of a leader has been an orator, who will worry and vex and terrify the ruling powers, not a constructive statesman whose plans will restore prosperity to the country. Hence, as the mass of the people have had no training for local self-government, so the leaders have had nothing to do but criticise, and have given little or no help to the English Government by any practical suggestions. They would answer that this is not their business, but that of the Executive, and that suggestions from them would be ill received. Nevertheless it is a serious obstacle to any progress with the pacification of Ireland. Those who claim to speak on behalf of the disaffected majority make vague and large demands, which English opinion holds inadmissible. They do not show how these demands could be satisfied by framing any scheme of government which would work. They declare that nothing less than their demands will be accepted, and generally refuse to coöperate in arranging some practicable compromise.

Some among them irritate even those Englishmen who desire to aid them by the unmeasured vehemence of their language and by their efforts to insult whatever the English respect. And thus, while they deprive the Government and Parliament of that help which the representatives of the country ought to render, they confirm the notion of the ordinary Englishman that the Irish, high and low, orator and peasant, are unfit to be trusted with their own affairs,—that an Irish assembly would be a place of endless and purposeless wrangling. He finds the Nationalist members unreasonable and impracticable. He complains that they insist on all or nothing; that they will not combine with those who are really their friends; that they are ostentatiously detached,—hostile to every English alliance. "Why not," he exclaims, "when you have a man like Mr. Gladstone, who has given so many proofs of his sincerity, who obviously desires to go as far in your direction as English public opinion will permit, and is constantly charged with yielding to you—why not recognize his good intentions (aye, and his good performance), facilitate his progress, show that his measures tend to pacify Ireland, instead of

agitating against him and denouncing his Government just as you denounced the Tories? It looks as if you wished to keep up irritation, to prevent reconciliation, to persuade your countrymen that England is still the same hostile foreign power she was seventy years ago. Perhaps your hope is that you will make England give you up in despair as irreconcilable, and at last part with you, not from any conviction that it will benefit you, but out of sheer weariness and disgust. You may think you are right; but you mistake the English people. They are now, under a popular constitution which expresses the feelings of the middle and working classes, more just and friendly to Ireland, more anxious to do what is right, more regardless of the English landlord garrison, than they ever were before. But they are as proud and resolute as ever, and you greatly err if you think you have more to gain from their fear or their exhaustion than from their love of justice and freedom."

What answer the Nationalist would make to such an appeal every one knows. But it is most true that the Irish do now misconceive the English people just as the English misconceive the state of mind of an Irish Nationalist. The English, who have forgotten the scorn and the misdeeds of their ancestors, assume that the Irish have forgotten all that too. They live in full light under conditions daily becoming more democratic; they do not know how much of the past darkness broods over the mind of an Irish peasant; they expect from the nation as a whole a reasonableness, a friendliness, a comprehension of our time which does not yet exist. The Nationalist, on the other hand, does not realize the change in England; he sees in her still the harsh and haughty master of 1798. The one expects too much; the other gives credit for too little.

Another reason for the apparent implacability of the Irish opposition, a reason unsufficiently grasped in England, is to be found in its internal divisions. It is composed of different sections, and the more moderate are forced to play up to the more extreme. I have already remarked that the gravity of the crisis since 1879 has consisted in the union of several hitherto distinct currents of anti-English feeling. But the coincidence of these parties has been, not a fusion, but only an alliance. Behind the parliamentary Nationalists—who in the main confine themselves to constitutional agitation, and who have not formally demanded anything more than a separate Irish parliament—stands the Fenian party, whose object is complete independence, its methods, conspiracy, and insurrection. This party has never submitted itself to the parliamentary opposition, and is quite capable of breaking with the more moderate men, of denouncing them, even of turning its weapons against them. There is no reason to believe it numerically strong, but it is desperate; it receives sympathy from many who hesitate to join it; it professes to control the contributions of the Irish in America, and has no doubt some support there. In a struggle between Jacobins and Girondins, the latter are apt to come off worst. Now the Fenian party will not hear of conciliation or compromise, and to accept a compromise would be to break with them. There is also what may be called the agrarian party among the peasantry and small shop-keepers, the local politicians and members of land leagues, or of the old Riband lodges,—the men who have hoped to get the land for nothing, who have been excited by the promises of agitators, by the success which attended the Land League movement, by the mere pleasure of conspiring and finding themselves powerful. This party was far from including the whole of the western and southern peasantry. The numerical majority of the people have probably been either neutral or inactively sympathetic. But it has been well organized, and it is strong just because there is no other party among the masses to confront it—no sentiment of friendliness to England, or attachment to the law. The parliamentary leaders cannot neglect it, for it is to its support that they mostly owe their seats. And it would regard with suspicion and disappointment any arrangement which gave it less than the whole of what it has been taught to demand. That it is easier to raise the devil than to lay him, is a maxim whose truth popular leaders have often had to ponder.

The necessity of keeping in good humor these extreme sections of their party must have been an enormous difficulty for the Nationalist chiefs, and one which English opinion has perhaps insufficiently allowed for. They have been severely judged by those who fail to perceive that it requires an altogether exceptional moral courage and strength of character for a leader to avoid being pressed on by the eagerness of his followers into a position which his judgment disapproves. Nothing so hard as to retire, or to counsel moderation, when you expose yourself to the charge (however groundless) of timidity or treason. A leader so placed may honestly, though erringly, think that he better serves his country and the world by remaining at the head of a movement, even when forced to go too far and say too much, and thus holding back the men of violent means and hopeless aims, rather

than by abandoning its guidance to desperate hands. I speak from no special knowledge of the inner state of the Nationalist party, about which I know no more than any other member of the general public. But no one who has watched its course during the last few years can help perceiving that its chiefs have repeatedly felt obliged to take steps and hold language they would not have taken or held of themselves, in order to please and keep up the excitement of their supporters in Ireland or America, people not only less informed but more violent and reckless than themselves. It were needless to show how much this increases the perplexity of English statesmen in dealing with such leaders. What is the use of convincing them if they are not free to act upon their own convictions, but must gratify a fierce faction whom no arguments or appeals from England can reach? What is gained by conceding their first demands, if new demands are immediately to be sprung upon you at the bidding of men who want nothing less than absolute independence? The agrarian party and the insurrectionist party expect from the parliamentary opposition only one thing — unremitting hostility to any English Government; and the parliamentary opposition is thus being always forced further than its cooler heads approve.

"What is it, then," it may be asked, "that makes the agrarianists and the insurrectionists so strong? They are not numerous; they are inferior in every way to the parliamentary leaders; why should they be obeyed?" This brings one to the kernel of the mischief. They are formidable, partly because there is no pacific party among the masses to oppose them, but mainly from that capital misfortune of Ireland, the severance of its upper from its lower classes. The natural leaders of a people ought to come from its higher class; that is to say, from the men of education, intelligence, social position — those who are naturally looked up to either in their own neighborhood or by the country at large. Their higher social standing, their wider intellectual outlook, gives such men not only a greater aptitude for politics, but a sense of responsibility which, when it is found among those who want these advantages, is due to the presence of quite exceptional natural capacity and virtue. I am far from saying that good leaders may not spring from the least cultivated classes; I observe only that a leader from among them has certain obstacles to overcome, certain grave temptations to encounter, which are less formidable to the person who starts from a higher platform of rank and knowledge. Now in Ireland these natural leaders are almost wanting. The popular party counts among its numbers few persons of rank, or wealth, or education; few who correspond to men like Mazzini, Daniel Manin, Poerio, Saffi, d'Azeglio, in the Italy of thirty years ago; few like those who led the commons of England in the struggle against the tyranny of the Stuarts, or like the heroes of the Revolution in America. The upper class in Ireland is mostly Protestant and Tory. The Protestant Liberals of Ulster stand (as a whole) aloof from the Nationalist movement; so, too, do the Catholic gentry, among whom there are indeed Home Rulers, but very few who desire separation. If they are not active friends of the present system, they dislike it less than the tactics of the revolutionary party. Thus it comes that nearly all the local leaders of the Nationalist movement, and many of their parliamentary leaders, belong to the peasant class, share its animosities, its narrow horizon, its incapacity for grasping the difficulties of the problem, its tendency to yield to mere feeling instead of taking a large and sober view of the situation, and seeking to reach the practicable best. These men are dangerous because they are swayed by those very prejudices which a leader ought to rise above and correct. They stimulate the people but do not enlighten it. One of them, at any rate, is a man of a high stamp, who has sought to check outrages, but he cannot exercise the sort of influence which the joint action of a group of enlightened men, however extreme in their views, might possess. Among the parliamentary leaders of the party there are several who, either by birth and position, or by education and culture, belong to the upper class. These things help a man even in a revolution. But such leaders stand almost alone. They have no local leaders of the same type behind them. They are generals in an army where there are hardly any trained officers, but only a vast rank and file, not indeed stupid, for there is always plenty of cleverness in Ireland, but ignorant and impatient. Hence they have not the requisite authority. They have not that body of opinion round them of their own class which, while it strengthens, steadies and controls. They have to appeal to the passions, or the bare material interest of their supporters, when the situation calls for a high and statesman-like tone. It may seem a paradox, but it is not the less a truth, that the Irish problem would be easier to solve if the so-called English garrison, if the whole of the educated class, belonged to the Nationalist party. For then the education and wealth of the country would recognize the advantages of maintaining some sort of connection with England, and would make their policy accepted by the masses; while English statesmen would have firm ground to tread upon,

people to deal with who could take a practical view of things, and hold to a bargain once struck.

As it is, the English Government finds itself on a quicksand. With whom is it to treat? Whom is it to accept as the exponents of the popular will? It may seem to have been assumed in the previous argument that the Nationalists are the nation. But, so far as parliamentary representation goes, they can claim less than half the Irish members. One may reckon them loosely at forty, though not all these follow implicitly one standard. Of the remaining sixty-four — Ireland having in all one hundred and four members — about twenty-seven are Tories, nine Ulster Liberal Protestants, and the rest nominally Home Rulers and for the most part Roman Catholics, but practically (with a few exceptions) supporters of the present Liberal Government, and therefore regarded as foes by the Nationalists themselves. These sixty-four represent technically more than half the country; substantially, no doubt, they represent less; for if a general election were now held, it is probable that the extreme party would obtain a majority, and come back with sixty or seventy members. However, at the lowest computation, more than a million Irishmen are opposed to the Nationalist programme, and this million includes nearly all the property and education of the island. A minority like this cannot be ignored. So the Irish who hold to England may fairly ask whether the wishes of the nation are to be learned and estimated solely from the more extreme party. "How is justice to be done to the majority without doing injustice to the minority, especially as this minority includes the most industrious and prosperous people in the country, the Scoto-Irish of the North? Is not England bound in honor, if she holds that in any sense the people of the whole United Kingdom are one people, to protect the religion and the property of such a minority from the consequences of separation?"

England has now something more important still to protect in Ireland — life and personal security. The difficulties we have hitherto been considering are political difficulties. But the deepest-rooted evil in Ireland is the existence of private crime, agrarian in its origin, but perpetrated not on landlords and agents only, but on whoever ventures, in three of the four provinces of the island, to disobey that unwritten law of the people which forbids a tenant to be expelled from his farm. Not merely the evicting landlord, but the new-comer who takes a farm whence another has been removed, even if for good cause, and the very laborer or herdsman who serves him, incurs the anger of the peasantry and stands in danger of his life. These habits of crime began in the last century, when the law was harsh and landlords were wont to use it harshly. It was the only remedy the peasants had — the only vengeance they could take for their wrongs. It was so far effective that it prevented many evictions which would otherwise have taken place; and, horrible as it seems, one must remember that it was often provoked by an unrighteous abuse of the landlord's power. The people came to forget its criminal character altogether, and looked on it as a sort of private war, and on any one who set himself against it and revealed the murderer as a traitor to his class. Hence the sympathy which surrounded the offender, the unwillingness to give information, to bear witness in court, to convict even on clear evidence. The immense difficulty of the Government in Ireland all this century has been to detect and punish these agrarian crimes, because the whole country-side, even if it does not applaud the particular act, is against the law and for the offender. A wife is banned if she gives evidence against the slayer of her husband, or a son of his father. A distinguished physician told me that he was once summoned to attend a man — the bailiff, I think, of some land-owner — who had been shot in an agrarian quarrel. The man knew who had shot him, and by a word could have brought his murderer to justice, but he would not speak that word during the three days he lingered, and he died without giving a clew.

This tacit league against the law has two fatal effects. It incenses the English, and gives them a bad opinion of the people, who seem to them more than ever unfit for self-government. And it forces every English administration, be it Tory or Liberal, to have recourse to coercive legislation, to suspend the ordinary law, and obtain extraordinary powers for seizing and trying offenders. The exercise of such powers is felt as a grievance in Ireland, and further exasperates the anti-English feeling. Even their legitimate use may be galling to ordinary citizens, nor can it fail to happen that they are sometimes misused. Exceptional legislation is taken as another proof that Ireland is treated differently from England. Yet what is a government to do which finds itself baffled by undetected criminals? It is even drawn on to apply these same exceptional powers to political offenses which are to modern sentiment less odious, and thus it commits the mistake of strengthening in the Irish mind the association between any sort of crime and patriotism, as being both directed against the foreign power.

This struggle against agrarian crime, forcing the best friends of liberty to assume a

sort of despotism, is the greatest difficulty which governments have to face in Ireland. But it is itself only a part of a larger phenomenon. The movement in Ireland is a social revolution. The volcano has been smoking and glowing under its ashes for more than a century, and now the lava-floods have rolled forth. This is no isolated thing in Europe. Most feudal countries have to pass through such a phase. The French peasants effected their social revolution in the end of the last century. The French workmen have repeatedly attempted one in our own time. In North Germany, the timely reforms of Stein averted a struggle among the agriculturists, while the spread of Socialism in the towns and the repressive measures of the Prussian Government show how serious the danger is in the artisan classes. In Russia we have been hearing the first mutterings of the storm. England has so far escaped, for her trade and manufactures have given unprecedented prosperity to the towns-people, while the agricultural laborers are not numerous enough, nor perhaps wretched enough, to be ready for a Jacquerie. And in England there has happily never been any sharp line between classes, nor any social rancor. But in Ireland all the elements existed—a redundant population, very miserable, very ignorant, with no resource but tillage, ruled by a caste alien to them in religion, in feeling, and, till recently, in language; a caste which had lived upon them in idleness, insulted them, neglected them. Who can wonder that when such a population is suddenly delivered from the fear that held it down, it should be intoxicated by the opportunity and should seek to possess itself of the land it has always thought to be rightfully its own? To any one who looks at the contrasts of misery and wealth in the world, and at the ignorance of economic laws which accompanies misery, it will appear surprising, not that the needy sometimes rise against the rich but that they do not rise more often. The Irish landlords of to-day are to be pitied, for they suffer for the sins of their predecessors, and some of them have bought their estates lately, thinking all danger over. They complain that England has not stood by them and has been generous to the tenantry at their expense. But their lot would have been far harder but for the proximity of English power which has broken the brunt of this revolution, protected their persons, averted that utter ruin which otherwise might have overtaken them. It is the conjunction of this social convulsion with a perplexing political problem that has taxed so severely the resources and the courage of English statesmen, and that made the crisis of 1880–82 the greatest Ireland has seen since 1798. Fortunately, England has been guided by a minister gifted with a courage and resource such as have not been applied to Irish questions since William of Orange's conquest made her first the disgrace and then the difficulty of English statesmanship.

England might crush this social revolution by an exercise of her physical power, as social revolutions have been crushed before now in Europe. She might, but she will not, because the masses in England have too much sympathy with the sufferings of the Irish peasantry, and because England altogether has become too tender in feeling, just as the Americans of the North were toward the defeated South, to use the stern methods of last century. There might be a fit of severity, but it could not long be maintained. On the other hand, England cannot bring herself to accept the social revolution and to let the numerical majority of Irishmen carry out their will, whatever that may prove to be; for England holds herself responsible for whatever happens in Ireland. If Ireland were cut adrift, a civil war might possibly have to decide the issues between the aboriginal nation and the Anglo-Scottish or Protestant colony, or rather (since the distinction of parties does not closely follow the difference of blood) between the tenants and laborers of the South and West, and the upper classes. Whichever faction triumphed, whether by arms or by votes, would abuse its power and trample on the rights of the other. England feels unable to tolerate this. If Ireland were left independent, and a civil war followed, England could not stand by and see excesses like those of the Communards and the Assembly at Paris in 1871 without interfering. If, a connection of the countries being maintained, domestic Irish legislation were committed to an Irish Parliament, and that Parliament used it to dispossess land-owners without compensation and establish the Roman Catholic church, England would be irresistibly moved to interfere. Therefore she clings to the idea that the United Kingdom is one; and, when the idea of cutting Ireland adrift presents itself, asks whether that would not be treason to those inhabitants of Ireland who do belong to the British rather than to the Irish nation, and to whom her faith seems so deeply plighted. She is in the difficulty of trying to combine two inconsistent plans of government. You may govern a nation as you would a boy—consider yourself in the light of a father, and rule it for its own good, but according to your own views. You may treat it as having attained its majority and let it govern itself, badly perhaps, but in

its own way, so that it may at last learn by its own experience. England does neither of these things. She attempts to combine the system of self-government, expressed in the parliamentary representation of Ireland, with the system of paternal government, expressed in the decisive voice which England retains. And she does this because she repeats in the same breath that Irish and English are one nation, and yet that Ireland must be governed according to Irish ideas. It is illogical, it is self-contradictory; yet the contradiction is in the facts. For the Irish, according as you look at them from this side or from that, are and are not a part of the British nation.

What the future has in store for Ireland; into what new phases the present crisis will pass; how far the Land Act will raise and pacify the peasantry; by what means the demand for self-government is to be satisfied without breaking up the United Kingdom; whether a separate Irish parliament might not rather aggravate than diminish the difficulties of the situation, and almost necessarily lead to a final severance of the two islands; whether such a severance would be any loss to England, however serious an injury it might be to Ireland,—these are questions of practical politics with which this article is not intended to deal. My only object has been to present to American readers, as fairly as I can, the conditions of the problem toward whose solution England and Ireland are struggling. Fortunate it is for America that, having settled a still larger and more formidable question, she can now look on calmly and sympathetically, judging both parties more fairly than either can yet judge the other. It would be rash to predict that the solution will come soon. Probably the English popular party must first gain a more distinct predominance in England than it now possesses; but come it will if only England patiently maintains that calm and friendly temper which the bulk of her people have shown since this last crisis began.

Things are, after all, far better than they were at the time of Catholic emancipation, or in 1848, or during the first Fenian outbreak. Though the element of secret crime is still formidable, the agitation is far more open, public, directed into a constitutional channel, than it was before. Obstruction is an improvement on conspiracy. The Nationalists are free to utter all their complaints, and do not spare to use this freedom; the English have learnt to listen quietly, and consider what they hear. The bulk of the English people,—the middle and working classes, who have less arrogance and more sympathy than the classes that formerly ruled, and which, in virtue of their sympathy, their love of justice and liberty, have also a kind of wisdom which aristocratic arrogance is shut out from,—this mass of the English and Scottish people honestly wishes to do right by Ireland. It does not quite know how, but it is willing to trust those statesmen whom it believes to be governed by its own wholesome instincts. In all questions of conduct there are two elements needed for success—the desire to do what is most just to and best for others as well as one's self, or, in other words, the right moral end, and the insight which enables one to see what is the course which will attain such a right and happy issue—in other words, the skillful choice of means. England now seems to be reaching the first of these two requisites for success. She is no longer thinking chiefly of herself and her English garrison in Ireland: she is thinking of and seeking what is really best for the Irish people and all sections of them. To discover this really best; to ascertain how Irish national aspirations and the legitimate demand for more control of their own destinies can be gratified without throwing back the forces that work for progress and civilization in the island, without creating matter for fresh disputes, without placing an industrious and educated minority at the mercy of a less enlightened majority—this is a hard task. Many efforts may have to be made, some failures encountered, before it is accomplished, before peace and unity are secured for Ireland, whether as a part of the United Kingdom or in a more or less independent position. But it is not, after all, more hard than what England has already done, when one compares her sentiments and conduct now with the sentiments and conduct of 1798. The Irish people themselves, with their quick and sensitive minds, can hardly fail to feel and appreciate the change. When they feel it and begin to regard England with some measure of confidence and good-will, the problem will have been more than half solved. The one point on which everything seems to turn is the perseverance of England and Scotland in their present temper, whatever disappointments or provocations may tempt them from it. A faith in justice and liberty is a new doctrine in the political relations of the stronger and the weaker, and it has a better promise of the future than any force that has been heretofore employed.

James Bryce.

THE CORRESPONDENCE OF CARLYLE AND EMERSON.

In the deluge of "new books," in which so many of us at present are occupied in swimming for our lives, it is not often that there floats toward us a pair of volumes so well deserving to be arrested in their passage as this substantial record * of a beautiful and distinguished friendship. The book has a high interest, and we have found it even more absorbing than we expected. It is only superficially, indeed, that it may be spoken of as new; for the persons and things it commemorates have already receded — so fast we move to-day — into a kind of historical perspective. The last letter that passed between the correspondents is of the date only of 1872; Carlyle died nine and Emerson ten years later. But we seem to see them from a distance; the united pair presents itself in something of the uplifted relief of a group on canvas or in marble. They have become, as I say, historical: so many of their emotions, their discussions, their interests, their allusions belong to a past which is already remote. It was, in fact, in the current of an earlier world that the Correspondence began. The first letter, which is from Emerson as the last is from Carlyle, is of the date of 1834. Emerson was the voice of New England in those days, and New England has changed not a little. There is something peculiarly young and tender in the social scene in which we see him engaged; for, in the interval that separates us from the period included in the whole of the first of these volumes and in the greater part of the second, a great many things have come and gone. The questions of those years are not the questions of these. There were more questions then, perhaps; at least, they made more show. It may seem to the reader of Emerson's early letters that at that time there was nothing in New England but questions. There were very few things, and even few persons. Emerson's personal references are rare. Bronson Alcott, W. E. Channing, Margaret Fuller, Thoreau, an occasional American about to go to Europe, carrying a letter or a book to Carlyle, constitute in this direction the chief objects of mention. Transcendentalism has come and gone, and the abolition of slavery, and the novelty of the Unitarian creed, and the revelation of Goethe, and the doctrine of a vegetable diet, and a great many other reforms then deemed urgent. Carlyle's extraordinary personality has, moreover, thanks to recent publications, revealed itself with unlooked-for vividness. Of few distinguished men has the public come into such complete possession so soon after death has unlocked the cabinets. The deeply interesting volumes given to the world so promptly by Mr. Froude, have transmuted the great Scotch humorist from a remote and mysterious personage — however portentous, disclosing himself in dusky, smoky ejaculations and rumblings — into a definite and measurable, an almost familiar figure, with every feature marked and every peculiarity demonstrated. We know Carlyle, in short; we may look at him at our ease, and the advantage, though we have enjoyed it but for a year or two, has become part of our modern illumination. When we receive new contributions accordingly, we know what to do with them, and where, as the phrase is, to fit them in; they find us prepared. I should add that if we know Carlyle, we know him in a great measure because he was so rich, so original a letter-writer. The letters in Mr. Froude's volumes constituted the highest value of those memorials and led us to look for entertainment as great in the Correspondence which Mr. Charles Eliot Norton had had for some time in his keeping, and which, though his name does not appear on the title-page, he has now edited with all needful judgment and care. Carlyle takes his place among the first of English, among the very first of all letter-writers. All his great merits come out in this form of expression; and his defects are not felt as defects, but only as striking characteristics and as tones in the picture. Originality, nature, humor, imagination, freedom, the disposition to talk, the play of mood, the touch of confidence — these qualities, of which the letters are full, will, with the aid of an inimitable use of language — a style which glances at nothing that it does not render grotesque, — preserve their life for readers even further removed from the occasion than ourselves, and for whom possibly the vogue of Carlyle's published writings in his day will be to a certain degree a subject of wonder. The light thrown upon his character by the mass of evidence edited by Mr. Froude had not embellished the image nor made the reader's sympathy advance at the same pace as his curiosity. But the volumes that lie before us

* The Correspondence of Thomas Carlyle and Ralph Waldo Emerson. 1834–1872. In two volumes. Boston: J. R. Osgood & Co., 1883.

seemed to promise a more genial sort of testimony, and the promise has been partly kept. Carlyle is here in intercourse with a friend for whom, almost alone among the persons with whom he had dealings, he appears to have entertained a sentiment of respect—a constancy of affection untinged by that humorous contempt in which (in most cases) he indulges when he wishes to be kind, and which was the best refuge open to him from his other alternative of absolutely savage mockery. Of the character, the sincerity, the genius, the many good offices of his American correspondent, he appears to have had an appreciation which, even in his most invidious hours, never belied itself. It is singular, indeed, that throughout his intercourse with Emerson he never appears to have known the satiric fury which he directed at so many other objects—accepting his friend *en bloc*, once for all, with reservations and protests so light that, as addressed to Emerson's own character, they are only a finer form of consideration. Emerson, on the other hand, who was so much more kindly a judge, so much more luminous a nature, holds off, as the phrase is, comparatively, and expresses, at times, at least, the disapprobation of silence. Carlyle was the more constant writer of the two, especially toward the end of their correspondence; he constantly expresses the desire to hear from Emerson oftener. The latter had not an abundant epistolary impulse; the form and style of his letters, charming as they are, is in itself a proof of that. But there were evidently certain directions in which he could not go with his friend, who has likewise sundry tricks of style which act at times even upon the placid nerves of the inventor of Transcendentalism. He thinks, for instance, that Carlyle's satire of the "gigmania" has been overdone; and this, although Emerson himself was as little as possible of a gigmaniac. I must add that it would be wrong to suppose that the element of reserve, or of calculated silence, plays in the least a striking part in the letters of either. There is nothing more striking, and nothing finer, than their confident frankness. Altogether the charm of the book is that as one reads it one is in excellent company. Two men of rare and beautiful genius converse with each other, and the conversation is a kind of exhibition.

There was something almost dramatic in the beginning of their friendship. Emerson, a young Bostonian, then unknown, went to Europe for the first time in 1833. He had read Carlyle's contributions to the "Edinburgh Review," and on his return from Italy, spending the summer in England, had no greater care than to become acquainted with the author. Carlyle, hardly better known then than Emerson,—poor, struggling, lonely, discouraged, but pregnant with all his future eloquence,—was spending at the farm of Craigenputtock, in the south of Scotland, those melancholy, those almost savage years of which we have so rich a report in the letters and journals published by Mr. Froude. "I found the house amid desolate, heathery hills, where the lonely scholar nourished his mighty heart." So writes Emerson in the first chapter of the "English Traits." The two spent a day of early autumn together, walking over the moors, and when they separated it was with a presentiment of the future and a conviction on the part of each that he had made a rare acquisition. Carlyle has commemorated in several places the apparition of the generous young American,—"one of the most lovable creatures in himself that we had ever looked upon," he wrote to his mother; and toward the end of his life, in one of these letters, he glances back at it in the tenderest manner, across the years. "I shall never forget the visitor," at a later date, too, Mrs. Carlyle wrote, "who years ago, in the desert, descended on us out of the clouds, as it were, and made one day there look like enchantment for us, and left me weeping that it was only one day." Emerson went back to America, and the first letter in this collection is of the date of nine months later—May, 1834. This letter contains, by the way, an allusion to Carlyle's situation at that time, which, in the light thrown upon his state of mind and circumstances at Craigenputtock by the "lonely scholar's" own letters, journals, and reminiscences, may provoke a smile. "I remembered with joy the favored condition of my lonely philosopher, his happiest wedlock, his fortunate temper, his steadfast simplicity, his all means of happiness—not," Emerson indeed adds, "that I had the remotest hope that he should so far depart from his theories as to expect happiness." Carlyle's fortunate temper and steadfast simplicity sound to-day like bold touches of satire. It is true that his idiosyncrasies were as yet more or less undeveloped. The Correspondence speedily became brisk, the more so that, in the winter of 1834–5, Carlyle had settled himself in London, that life and work had opened to him with a somewhat better promise, and that the transmission to his American disciple of his new compositions offered repeated occasion for letters.

They pass with frequency for the following fifteen years, when there is an interruption of a twelvemonth. They begin again in 1850, and continue at the rate of two or three a year, till 1856. After this they are less frequent, though the mutual regard of the

writers evidently knew no diminution. In 1872, Emerson went abroad again (he had visited England for a second time in 1847); and after his return the letters cease. Many of the early ones are occupied with the question of the republication of Carlyle's writings in America. Emerson took upon himself to present "Sartor Resartus" and some of its successors to the American public, and he constantly reports to the author upon the progress of this enterprise. He transmits a great many booksellers' accounts as well as a considerable number of bills of exchange, and among the American publishers is a most faithful and zealous representative of his friend. Some of these details, which are very numerous, are tedious; but they are interesting at the same time, and Mr. Norton has done well to print them all. In the light of the present relations of British authors to the American public, they are curious reading. There appears to have been a fortunate moment (it was not of long duration) when it was possible for the British author to reap something of a harvest here. It would appear that, between 1838 and 1847, Emerson sent Carlyle some five hundred and thirty pounds, the proceeds of the sale of several of his works in this country. The sum is not large, but it must be measured by the profit that he had up to that time derived in England. It was in Boston that "Sartor Resartus," with which the English publishers would have so little to do, first made its way into the light, after a precarious and abbreviated transit through "Fraser's Magazine." "It will be a very brave day," Carlyle wrote in 1838, after Emerson had made arrangements for the issue of the "French Revolution" in Boston, "it will be a very brave day when cash actually reaches me, no matter what the *number* of the coins, whether seven or seven hundred, out of Yankee-land; and strange enough, what is not unlikely, if it be the *first* cash I realize for that piece of work—Angle-land continuing still *in*solvent to me." Six years later, in 1844, he writes, on the occasion of a remittance from Emerson of thirty-six pounds, "America, I think, is like an amiable family tea-pot; you think it is all out long since, and lo, the valuable implement yields you another cup, and another!" Encouragement had come to him from America as well as money; and there is something touching in the care with which Emerson assures him of the growth of his public on this side of the ocean, and of there being many ingenuous young persons of both sexes to whom his writings are as meat and drink. We had learned from Mr. Froude's publications that his beginnings were difficult; but this Correspondence throws a new light upon those grim years—I mean in exposing more definitely the fact that he was for some time on the point of coming to seek his fortune in this country. Both his own and Emerson's early letters are full of allusions to this possible voyage: for Emerson, in particular, the idea appears to have a fascination; he returns to it again and again, keeps it constantly before his correspondent, never ceases to express his desire that Carlyle should embark for Boston. There was a plan of his giving lectures in the United States, and Emerson, at Carlyle's request, collects all possible information as to the expenses and the rewards of such an attempt. It would appear that the rewards of the lecturer's art, fifty years ago, were extremely slender in comparison of what they have since become; though it must be added that Emerson gives a truly touching description of the cost of living. One might have entertainment at the best hotels for the sum of eight dollars a week. It is true that he gives us no re-assurance as to what the best hotels in America, fifty years ago, may have been. Emerson offers his friend the most generous hospitality; on his return from Europe, he had married and settled himself at Concord. To Concord he entreats Mr. and Mrs. Carlyle to take their way; their room is ready and their fire is made. The reader at this point of the correspondence feels a certain suspense: he knows that Carlyle never did come to America, but like a good novel the letters produce an illusion. He holds his breath, for the terrible Scotchman may after all have embarked, and there is something really almost heart-shaking in the thought of his transporting that tremendous imagination and those vessels of wrath and sarcasm to an innocent New England village. The situation becomes dramatic, like the other incident I have mentioned, in the presence of Emerson's serene good faith, his eagerness for the arrival of such a cloud-compelling host. The catastrophe never came off, however, and the air of Concord was disturbed by no fumes more irritating than the tonic emanations of Emerson's own genius. It is impossible to imagine what the historian of the French Revolution, of the iron-fisted Cromwell, and the Voltairean Frederick, would have made of that sensitive spot, or what Concord would have made of Carlyle.

Emerson, indeed, throughout had no hesitations on this score, and talked of the New England culture to his lurid correspondent without the least fear that his delicate specimens would be scorched. He sends him Mr. Alcott, he sends him Margaret Fuller, and others besides, who have a varying fortune at

the little house in Cheyne Walk. It is true that Carlyle gave him constantly the encouragement of a high and eloquent esteem for his own utterances. He was evidently a great and genuine admirer of the genius, the spirit of his American friend, and he expresses this feeling on a dozen occasions.

"My friend! you know not what you have done for me there [in the oration of 'The American Scholar']. It was long decades of years that I had heard nothing but the infinite jangling and jabbering, and inarticulate twittering and screeching, and my soul had sunk down sorrowful and said there is no articulate speaking then any more, and thou art solitary among stranger-creatures; and lo, out of the West comes a clear utterance, clearly recognizable as a *man's* voice, and I *have* a kinsman and brother: God be thanked for it! I could have *wept* to read that speech; the clear high melody of it went tingling through my heart; I said to my wife, 'There, woman!' * * * My brave Emerson! And all this has been lying silent, quite tranquil in him, these seven years, and the 'vociferous platitude' dinning his ears on all sides, and he quietly answering no word; and a whole world of thought has silently built itself in these calm depths, and, the day having come, says quite softly, as if it were a common thing, 'Yes, *I am* here, too.' Miss Martineau tells me, 'Some say it is inspired; some say it is mad.' Exactly so; no *say* could be suitabler."

That is from a letter of 1837, and though at a later date (in 1850) he speaks of seeing "well enough what a great deep cleft divides us in our ways of practically looking at this world"; though, too (in 1842), he had already uttered a warning against Emerson's danger (with his fellow-transcendentalists) of "soaring away * * * into perilous altitudes, beyond the curve of perpetual frost * * * and seeing nothing under one but the everlasting snows of Himmalayah"—the danger of "inanity and mere injuring of the lungs!"—though, as I say, he threw out his reflections upon certain inevitable disparities, his attitude toward the Concord philosopher remained (I have already noted it) an eminently hospitable one. "The rock-strata, miles deep, unite again; and the two poor souls are at one," he adds in the letter written in 1850, from which I have just quoted. When "English Traits" came out, Carlyle wrote, "Not for seven years and more have I got hold of such a Book;—Book by a real *man*, with eyes in his head; nobleness, wisdom, humor, and many other things in the heart of him. Such Books do not turn up often in the decade, in the century." He adds, indeed, rather unexpectedly: "In fact, I believe it to be worth all the Books ever written by New England upon Old." Carlyle speaks as if there had been an appreciable literature of that kind. It is faint praise to say that "English Traits" was the authority on the subject. He declares in another letter that "My Friend Emerson, alone of all voices out of America, has sphere-music in him for me." These words, written in 1843, are part of a paragraph in which Carlyle expresses his feelings with regard to the American "reforming" class at large. The high esteem in which he held his correspondent did not impel him to take an enthusiastic view of certain persons with whom, apparently, he supposed his correspondent to be in some degree associated. "Another Channing, whom I once saw here, sends me a 'Progress-of-the-Species' Periodical from New York. *Ach Gott!* These people and their affairs seem all 'melting' rapidly enough into thaw-slush, or one knows not what. Considerable madness is visible in them * * * I am terribly sick of all that;—and wish it would stay at home at Fruitland, or where there is good pasture for it, * * * [a] bottomless hubbub, which is not all cheering." Several of the wanderers from "Fruitland" knocked at his door, and he speaks of them to Emerson with a humorous irreverence that contrasts characteristically with Emerson's own tone of consideration (that beautiful courtesy which he never lost) for the same persons. One of them, "all bent on saving the world by a return to acorns and the golden age," he desires to be suffered to love him as he can, "and live on vegetables in peace; as I, living *partly* on vegetables, will continue to love him!" But he warns Emerson against the "English Tail" of the same visitor, who, arrived in London, apparently had given away his confidence on terms too easy. "Bottomless imbeciles ought not to be seen in company with Ralph Waldo Emerson, who has already *men* listening to him on this side of the water." Of Margaret Fuller, however,—one of those who had attempted "the flight of the unwinged," as he calls it,—Carlyle speaks in the most affectionate though the most discriminating manner:

"Poor Margaret, that is a strange tragedy that history of hers, and has many traits of the Heroic in it, though it is wild as the prophecy of a Sybil. Such a predetermination to *eat* this big Universe as her oyster or her egg, and to be absolute empress of all height and glory in it that her heart could conceive, I have not before seen in any human soul. Her 'mountain *me*' indeed:—but her courage too is high and clear, her chivalrous nobleness indeed is great; her veracity, in its deepest sense, *à toute épreuve*."

It is difficult to resist quoting, where so much is quotable; but the better way is to urge the reader to go straight to the book. Then he will find himself interested, even more than in the happy passages of characterization in which it abounds, in the reflection it offers of two contrasted characters of men

of genius. With several qualities in common, Carlyle and Emerson diverged, in their total expression, with a completeness which is full of suggestion as to their differences of circumstance, race, association, temper. Both were men of the poetic quality, men of imagination; both were Puritans; both of them looked, instinctively, at the world, at life, as a great total, full of far-reaching relations; both of them set above everything else the importance of conduct — of what Carlyle called veracity and Emerson called harmony with the universe. Both of them had the desire, the passion, for something better, — the reforming spirit, an interest in the destiny of mankind. But their variations of feeling were of the widest, and the temperament of the one was absolutely opposed to the temperament of the other. Both were men of the greatest purity and, in the usual sense, simplicity of life; each had a high ideal, each kept himself unspotted from the world. Their Correspondence is to an extraordinary degree the record, on either side, of a career with which nothing base, nothing interested, no worldly avidity, no vulgar vanity or personal error, was ever mingled — a career of public distinction and private honor. But with these things what disparities of tone, of manner, of inspiration! "Yet I think I shall never be killed by my ambition," Emerson writes in a letter of the date of 1841. "I behold my failures and shortcomings there in writing, wherein it would give me much joy to thrive, with an equanimity which my worst enemy might be glad to see. * * * My whole philosophy — which is very real — teaches acquiescence and optimism. Only when I see how much work is to be done, what room for a poet — for any spiritualist — in this great, intelligent, sensual and avaricious America, I lament my fumbling fingers and stammering tongue." Emerson speaks the word in that passage; he was an optimist, and this in spite of the fact that he was the inspiration of the considerable body of persons who at that time, in New England, were seeking a better way. Carlyle, on the other hand, was a pessimist — a pessimist of pessimists — and this great difference between them includes many of the others. The American public has little more to learn in regard to the extreme amenity of Emerson, his eminently gentle spirit, his almost touching tolerance, his deference toward every sort of human manifestation; but many of his letters remind us afresh of his singular modesty of attitude and of his extreme consideration for that blundering human family whom he believed to be in want of light. His optimism makes us wonder at times where he discovered the errors that it would seem well to set right, and what there was in his view of the world on which the spirit of criticism could feed. He had a high and noble conception of good, without having, as it would appear, a definite conception of evil. The few words I have just quoted in regard to the America of 1841, "intelligent, sensual, and avaricious," have as sharp an ironical ring in them as any that I remember to have noticed in his part of the Correspondence. He has not a grain of current contempt; one feels, at times, that he has not enough. This salt is wanting in his taste of things. Carlyle, on the other hand, who has fearfully little amenity (save in his direct relation to Emerson, where he is admirable), has a vivid conception of evil without a corresponding conception of good. Curiously narrow and special, at least, were the forms in which he saw this latter spirit embodied. "For my heart is sick and sore on behalf of my own poor generation," he writes in 1842. "Nay, I feel withal as if the one hope of help for it consisted in the possibility of new Cromwells and new Puritans." Eleven years later, returning from a visit to Germany, he writes that "truly and really the Prussian soldiers, with their intelligent *silence*, with the touches of effective Spartanism I saw or fancied in them, were the class of people that pleased me best." There could be nothing more characteristic of Carlyle than this confession that such an impression as that was the most agreeable that he had brought back from a Continental tour. Emerson, by tradition and temperament, was as deeply rooted a Puritan as Carlyle; but he was a Puritan refined and sublimated, and a certain delicacy, a certain good taste would have prevented him from desiring (for the amelioration of mankind) so crude an occurrence as a return of the regiments of Oliver. Full of a local quality, with a narrow social horizon, he yet never would have ventured to plead so undisguisedly (in pretending to speak for the world at large) the cause of his own parish. Of that "current contempt" of which I just now spoke, Carlyle had more than enough. If it is humorous and half-compassionate in his moments of comparative tolerance, it is savage in his melancholy ones; and, in either case, it is full of the entertainment which comes from great expression. "Man, all men, seem radically dumb, jabbering mere jargons and noises from the teeth outward; the inner meaning of them — of them and of me, poor devils — remaining shut, buried forever. * * * Certainly could one generation of men be forced to live without rhetoric, babblement, hearsay, in short with the tongue well cut out of them alto-

gether, their fortunate successors would find a most improved world to start upon!" Carlyle's pessimism was not only deep, but loud; not of the serene, but of the irritable sort. It is one of the strangest of things to find such an appreciation of silence in a mind that in itself was, before all things, expressive. Carlyle's expression was never more rich than when he declared that things were immeasurable, unutterable, not to be formulated. "The gospel of silence, in thirty volumes," that was a happy epigram of one of his critics; but it does not prevent us from believing that, after all, he really loved, as it were, the inarticulate. And we believe it for this reason, that the working of his own genius must have been accompanied with an extraordinary internal uproar, sensible to himself, and from which, in a kind of agony, he was forced to appeal. With the spectacle of human things resounding and reverberating in his head, awaking extraordinary echoes, it is no wonder that he had an ideal of the speechless. But his irritation communed happily for fifty years with Emerson's serenity; and the fact is very honorable to both.

"I have sometimes fancied I was to catch sympathetic activity from contact with noble persons," Emerson writes in a letter from which I have already quoted; "that you would come and see me; that I should form stricter habits of love and conversation with some men and women here who are already dear to me." That is the tone in which he speaks, for the most part, of his own life; and that was the tone which doubtless used to be natural in Concord. His letters are especially interesting for the impression they give us of what we may call the thinness of the New England atmosphere in those days—the thinness, and, it must be added, the purity. An almost touching lightness, sparseness, transparency marked the social scenery in those days; and this impression, in Emerson's pages, is the greater by contrast with the echoes of the dense, warm life of London that are transmitted by his correspondent. One is reminded, as we remember being reminded in the perusal of Hawthorne's "American Notebooks," of the importance of the individual in that simple social economy—of almost any individual who was not simply engaged in buying and selling. It must be remembered, of course, that the importance of the individual was Emerson's great doctrine; every one had a kingdom within himself—was potential sovereign, by divine right, over a multitude of inspirations and virtues. No one maintained a more hospitable attitude than his toward anything that any one might have to say. There was no presumption against even the humblest, and the ear of the universe was open to any articulate voice. In this respect the opposition to Carlyle was complete. The great Scotchman thought *all* talk a jabbering of apes; whereas Emerson, who was the perfection of a listener, stood always in a posture of hopeful expectancy and regarded each delivery of a personal view as a new fact, to be estimated on its merits. In a genuine democracy all things are democratic; and this spirit of general deference, on the part of a beautiful poet who might have availed himself of the poetic license to be fastidious, was the natural product of a society in which it was held that every one was equal to every one else. It was as natural on the other side that Carlyle's philosophy should have aristocratic premises, and that he should call aloud for that imperial master, of the necessity for whom the New England mind was so serenely unconscious. Nothing is more striking in Emerson's letters than the way in which people are measured exclusively by their moral standards, designated by moral terms, described according to their morality. There was nothing else to describe them by. "A man named Bronson Alcott is great, and one of the jewels we have to show you. * * * A man named Bronson Alcott is a majestic soul, with whom conversation is possible. He is capable of the truth, and gives one the same glad astonishment that he should exist which the world does. * * * The man Alcott bides his time. —— —— is a beautiful and noble youth, of a most subtle and magnetic nature. * * * I have a young poet in the village named Thoreau, who writes the truest verses. I pine to show you my treasures. * * * One reader and friend of yours dwells now in my house, Henry Thoreau, a poet whom you may one day be proud of, a noble, manly youth, full of melodies and inventions." Carlyle, who held melodies and inventions so cheap, was probably not a little irritated (though, faithful to his constant consideration for Emerson, he shows it but mildly) by this enumeration of characters so vaguely constituted. "In fact, I do again desiderate some *concretion* of these beautiful *abstracta*." That remark which he makes in regard to one of Emerson's discourses, might have been applied to certain of his friends. "The *Dial*, too, it is all spirit-like, aëriform, aurora-borealis-like. Will no *Angel* body himself out of that; no stalwart Yankee *man*, with color in the cheeks of him and a coat on his back?" Emerson speaks of his friends too much as if they were disembodied spirits. One doesn't see the color in the cheeks of them and the coats on their back. The fine touch in his letters, as in his other writings, is

always the spiritual touch. For the rest, felicitous as they are, for the most part they suffer a little by comparison with Carlyle's; they are less natural, more composed, have too studied a quaintness. It was his practice, apparently, to make two drafts of these communications. The violent color, the large, avalanche-movement of Carlyle's style—as if a mass of earth and rock and vegetation had detached itself and came bouncing and bumping forward—make the efforts of his correspondent appear a little pale and stiff. There is always something high and pure in Emerson's speech, however, and it has often a perfect propriety—seeming, in answer to Carlyle's extravagances, the note of reason and justice. "Faith and love are apt to be spasmodic in the best minds. Men live on the brink of mysteries and harmonies into which they never enter, and with their hand on the door-latch they die outside."

Emerson's views of the world were what the world at all times thought highly peculiar; he neither believed nor thought nor spoke in the most apprehensible manner. He says himself (in 1840) that he is "gently mad"—surrounded, too, by a number of persons in the same condition. "I am gently mad myself and am resolved to live cleanly. George Ripley is talking up a colony of agriculturists and scholars, with whom he threatens to take the field and the book. One man renounces the use of animal food; and another of coin; and another of domestic hired service; and another of the State; and on the whole, we have a commendable share of reason and hope." But Emerson's "madness" was as mild as moonlight, compared with the strange commixture of the nature of his friend. If the main interest of these letters is, as I have said, their illustration of the character of the writers, the effect of Carlyle's portion of them is to deepen our sense, already sufficiently lively, of his enormous incongruities. Considerably sad, as he would have said himself, is the picture they present of a man of genius. One must allow, of course, for his extraordinary gift of expression, which set a premium on every sort of exaggeration; but even when one has done so, darkness and horror reside in every line of them. He is like a man hovering on the edge of insanity—hanging over a black gulf and wearing the reflection of its bottomless deeps in his face. His physical digestion was of the worst; but it was nothing compared with his moral digestion. Truly, he was not genial, and he was not gracious; as how should he have been in such conditions? He was born out of humor with life; he came into the world with an insurmountable prejudice; and to be genial and gracious naturally seemed of small importance in the face of the eternal veracities—veracities of such a grim and implacable sort. The strangest thing, among so many that were strange, was that his magnificent humor—that saving grace which has eased off the troubles of life for so many people who have been blessed with it—did so little to lighten his burden. Of this humor these volumes contain some admirable specimens—as in the description of "the brave Gambardella," the Neapolitan artist who comes to him with an introduction from Emerson; of the fish-eating Rio, historian of Christian Art; of the "loquacious, scriblacious" Heraud; of the "buckramed and mummy-swathed" Miss Martineau, and many more besides. His humor was in truth not of comic but of tragic intention, and not so much a flame as an all-enveloping smoke. His treatment of all things is the humorous—unfortunately in too many cases the ill-humorous. He even hated his work—hated his subjects. These volumes are a sort of record of the long weariness and anguish (as one may indeed call it) with which he struggled through his "Cromwell," his "French Revolution," and the history of Frederick. He thought, after all, very little of Frederick, and he detested the age in which he lived, the "putrid eighteenth century—an ocean of sordid nothingness, shams, and scandalous hypocrisies." He achieved a noble quantity of work, but all the while he found no inspiration in it. "The reason that I tell you nothing about Cromwell is, alas, that there is nothing to be told. I am, day and night, these long months and years, very miserable about it—nigh broken-hearted often. * * * No history of it *can* be written to this wretched, fleering, sneering, canting, twaddling, God-forgetting generation. How can I explain men to Apes by the Dead Sea?" Other persons have enjoyed life as little as Carlyle; other men have been pessimists and cynics; but few men have rioted so in their disenchantments, or thumped so perpetually upon the hollowness of things with the view of making it resound. Pessimism, cynicism, usually imply a certain amount of indifference and resignation; but in Carlyle these forces were nothing if not querulous and vocal. It must be remembered that he had an imagination which made acquiescence difficult—an imagination haunted with theological and apocalyptic visions. We have no occasion here to attempt to estimate his position in literature, but we may be permitted to say that it is mainly to this splendid imagination that he owes it. Both the moral and the physical world were full of pictures for him, and it would seem to be by his great

pictorial energy that he will live. To get an idea of the solidity and sincerity of this gift one must read his notes on a tour in Ireland in 1849;* it is a revelation of his attention to external things and his perception of the internal states that they express. His doctrine, reduced to the fewest words, is that life is very serious and that every one should do his work honestly. This is the gist of the matter; all the rest is magnificent vocalization. We call it magnificent, in spite of the fact that many people find him unreadable on account of his unprecedented form. His extemporized, empirical style, however, seems to us the very substance of his thought. If the merit of a style lies in complete correspondence with the feeling of the writer, Carlyle's is one of the best. It is not defensible, but it is victorious; and if it is neither homogeneous, nor, at times, coherent, it bristles with all manner of felicities. It is true, nevertheless, that he had invented a manner, and that his manner had swallowed him up. To look at realities and not at imitations is what he constantly and sternly enjoins; but all the while he gives us the sense that it is not at things themselves, but straight into this abysmal manner of his own that he is looking.

All this, of course, is a very incomplete account of him. So large a genius is full of interest of detail, and in the application in special cases of that doctrine of his which seems so simple there is often the greatest suggestiveness. When he does look *through* his own manner into the vivid spots of history, then he sees more in them than almost any one else. We may add that no account of him would have even a slight completeness which should fail to cite him as a signal instance of the force of local influences, of the qualities of race and soil. Carlyle was intensely of the stock of which he sprang, and he remained so to the end. No man of equal genius was probably ever less of a man of the world at large—more exclusively a product of his locality, his clan, his family. Readers of his "Reminiscences" and of Mr. Froude's memoir will remember how the peasant-group in which he was born—his parents, his brothers and sisters—appeared to constitute one of the great facts of the universe for him; and we mean not as a son and a brother simply, but as a student of human affairs. He was impressed, as it were, with the historical importance of his kinsfolk. And as one finds a little of everything in a man of genius, we find a great deal of tenderness even in the grimness of Carlyle; so that we may say, as the last word of all (for it qualifies our implication that he was narrow), that his tenderness was never greater than when, in spite of the local limitation, he stretched across the ocean, in gratitude for early sympathy, for early services, and held fast to the friendship of Emerson. His family was predominant for him, as we say, and he cleaved to his relations, to his brothers. But it was as a brother that he addressed Emerson.

Henry James, Jr.

YESTERDAY AND TO-DAY.

(YESTERDAY.)

It is so wide, this great world vaulted o'er
By the blue sky clasping white shore to shore.
And yet it is not wide enough for me!
I love you so—it cannot hold my love.
There is not space in earth or heaven above.
There is not room for my great love and me.

(TO-DAY.)

It is so wide, this great world vaulted o'er
By the sad sky clasping dark shore to shore,
It is too wide—it is too wide for me!
Would God that it were narrowed to a grave,
And I slept quiet, naught hid with me save
The love that was too great—too great for me.

Frances Hodgson Burnett.

SPLIT ZEPHYR.

AN ATTENUATED YARN SPUN BY THE FATES.

It was the evening of Commencement Day. The old church on the green, which had rung for many consecutive hours with the eloquence of slim young gentlemen in evening dress, exhorting the Scholar in Politics or denouncing the Gross Materialism of the Age, was at last empty and still. As it drew the dewy shadows softly about its eaves and filled its rasped interior with soothing darkness, it bore a whimsical likeness to some aged horse which, having been pestered all day with flies, was now feeding in peace along the dim pasture.

It was Clay who suggested this resemblance, and we all laughed appreciatively, as we used to do in those days at Clay's clever sayings. There were five of us strolling down the diagonal walk to our farewell supper at "Ambrose's." Arrived at that refectory, we found it bare of guests and had things quite to ourselves. After supper, we took our coffee out in the little court-yard, where a fountain dribbled, and the flutter of the grape leaves on the trellises in the night wind invited to confidences.

"Well, Armstrong," began Doddridge, "where are you going to spend the vacation?"

"Vacation!" answered Armstrong; "vacations are over for me."

"You're not going to work for your living at once?" inquired Berkeley.

"I'm going to work to-morrow," replied Armstrong, emphatically: "I'm going down to New York to enter a law office."

"I thought you had some notion of staying here and taking a course of graduate study."

"No, sir! The sooner a man gets into harness, the better. I've wasted enough time in the last four years. The longer a man loafs around in this old place, under pretense of reading and that kind of thing, the harder it is for him to take hold."

Armstrong was a rosy little man, with yellow hair and light eyes. His expression was one of irresolute good nature. His temper was sanguine and expansive, and he had been noted in college for anything but concentration of pursuit. He was gregarious in his habits, susceptible and subject to sudden enthusiasms. His good nature made him a victim to all the bores and idlers in the class, and his room became a favorite resort for men on their way to recitation, being on the ground floor and near the lecture-rooms. They would drop in about half an hour before the bell rang, and make up a little game of "penny ante" around Armstrong's center-table. In these diversions he seldom took part, as he had given it out publicly that he was "studying for a stand"; but his abstinence from the game in no wise damped the spirits of his guests. Occasionally his presence would receive the notice of the company somewhat as follows:

No. 1. "Make less noise, fellows: Charley is digging out that Puckle lesson."

No. 2. "You go into the bedroom, Charley, and shut the door, and then you wont be bothered by the racket."

No. 3. "Oh, hang the Puckle! Come and take a hand, Charley. We'll let you in this pool without an ante."

No. 4. "Why don't you get a new pack of cards, Charley? It's a disgrace to you to keep such a dirty lot of old pasteboards for your friends."

In face of which abuse, Armstrong was as helpless as Telemachus under the visitation of the suitors. The resolute air with which he now declared his intention of grappling with life had therefore something comic about it, and Berkeley said, rather incredulously:

"I suppose you'll keep up your reading along with your law?"

"No," replied the other; "Themis is a jealous mistress. No; I'm going to bone right down to it."

"Haven't you changed your ideal of life lately?" asked Clay, a little scornfully.

"Perhaps I have," said Armstrong, "perhaps I've had to."

"What *is* your ideal of life?" I inquired.

"Well, I'll tell you," he answered, draining his coffee cup solemnly, and putting it down with the manner of a man who has made up his mind. The rest of us arranged ourselves in attitudes of attention. "My ideal is independence," began Armstrong. "I want to live my own life; and as the first condition of independence is money, I'm going for money. Culture and taste, and all that, are well enough when a man can afford it, but for a poor man it means just so many additional wants which he can't gratify. My father is an educated

man; a country minister with a small salary and a large family; and his education, instead of being a blessing, has been an actual curse to him. He has pined for all sorts of things which he couldn't have — books, engravings, foreign travel, leisure for study, nice people and nice things about him. I've made up my mind that, whatever else I may be, I wont be poor, and I wont be a minister, and I wont have a wife and brats hanging to me. I tell you that, next to ill health, poverty is the worst thing that can happen to a man. All the sentimental grievances that are represented in novels and poetry as the deepest of human afflictions,—disappointed ambitions, death of friends, loss of faith, estrangements, having your girl go back on you,— they don't signify very long if a man has sound health and a full purse. The ministers and novel writers and fellows that preach the sentimental view of life don't believe it themselves. It's a kind of professional or literary quackery with them. Just let them feel the pinch of poverty, and then offer them a higher salary or a chance to make a little 'sordid gain' in some way, and see how quick they'll accept the call to 'a higher sphere of usefulness.' Berk, hand over a match, will you; this cigar has gone out."

"Loud cries of 'We will — we will'!" said Berkeley. "But can it be? Has the poick turned cynic, and the sickly sentimentalist become a materialist and a misogynist?"

(Armstrong was our class poet, and had worried the official muse on Presentation Day to the utterance of some four hundred lines filled with allusions to Alma Mater, Friendship's Altar, the Elms of Yale, etc. His piece on that occasion had been "pronounced, by a well known literary gentleman who was present, equal to the finest productions of our own Willis.")

"I'll bet the cigars," said Doddridge, "that Armstrong marries the first girl he sees in New York."

"Yes," said Clay, "his boarding-house keeper's daughter."

"And has a dozen children before he is forty," added Berkeley; "a dozen kids, and all of them girls. Charley is sure to be a begetter of wenches."

"And writes birthday odes 'To My Infant Daughter' for the 'Home Journal,'" continued Clay.

"No, no," said the victim of this banter, shaking his head solemnly. "I shall give no hostages to Fortune. I mean to live snug and carry as little sail as possible: to leave only the narrowest margin out for Fate to tread on. The man who has the fewest exposed points leads, on the whole, the happiest life. How can a man enjoy himself freely when a piece of defective plumbing, the bursting of a toy pistol, the carelessness of a nurse, may plunge him into a life-long sorrow? I don't say it's a very noble life that I propose to myself, but it's a safe one. I'm too nervous and anxious to stand the responsibilities of matrimony."

"If you can't stand responsibility," said Doddridge, "I don't see why you choose the law for a profession. You don't seem to me cut out for a lawyer anyway. I always thought you meant to be some kind of a literary chap."

"Yes," said Berkeley, "why don't you go for a snug berth under the government, or study for a tutorship here? That's the life that would suit you, old man."

"Not at all," answered Armstrong; "I have a horror of any salaried position, or of any position where a man is obliged to conform his habits and opinions to other people's. It is the worst sort of dependence. Now a lawyer in successful practice, and especially if he is a bachelor, is about as independent as a man can be. His relations with his clients are merely professional, and what he does or thinks privately is nobody's business."

"If you are going to be a mere lawyer," asked Clay, "what becomes of your education and your intellectual satisfactions, etc.?"

"A man can get his best intellectual satisfactions out of the work of his profession," answered Armstrong. "Besides, as to that, there's time enough. Fifteen years of solid work will enable one to put by a fair competence, if he lives carefully and has no one but himself to support; and then he will be free to take up a hobby. Oh, I shall cultivate a hobby or two after awhile. It keeps the mind healthy to have some interest of the kind outside of one's business. I may take to book-collecting or numismatics or raising orchids. Perhaps I may become an authority on ancient armor; time enough for that by and by. And then I can cut over to Europe every summer if I like, and no one to interfere with my down-sittings or my up-risings, my goings-out or my comings-in. Do you know," he went on, after a pause, "how I always look to myself in the glass of the future? I figure myself like old Tulkinghorn, in 'Bleak House,'— going down into his reverberating vaults for a bottle of choice vintage, after the work of the day, and then sitting quietly in the twilight in his dusky, old-fashioned law chambers, sipping his wine while the room fills with the fragrance of southern grapes. The gay old silver-top!"

There was silence for a few minutes after Armstrong had finished his declaration. It was broken by Berkeley, who had risen, and

was walking up and down in front of the fountain with his hands thrust into his pockets.

"You couldn't lead that sort of life if you tried," he said; "you aren't built for it."

"Don't you make any mistake," rejoined the other; "it's the sort of life I'm going to live."

"It's a cowardly life," retorted Berkeley.

"Did I say it wasn't? I said it was safe. You can call it what you like."

"Well," replied Berkeley, seating himself again, "my ideal career is just the opposite of that."

"Suppose you explain yours, then," said Armstrong.

Berkeley hesitated a few moments before beginning. He was a lean, tallish fellow, with a Scotch cast of countenance, a small blue eye, high cheek bones, a freckled skin, and whity-brown hair. He had a dry, cautious humor, fed by much out of the way reading. He had been distinguished in college by methodical habits, a want of ambition, a disposition to keep to himself, and a mixture of selfishness and *bonhomie* which made him a cold friend but an agreeable companion. It was therefore with some surprise that we heard him deliver himself as follows:

"I believe that the greatest mistake a man can make is in not getting enough out of life. I want to lead a full life, to have a wide experience, to develop my whole nature to the utmost, to touch mankind at the largest possible number of points. I want adventure, change, excitement, emotion, suffering even,—I don't care what, so long as it is not stagnation. Just consider what there is on this planet to be seen, learned, enjoyed, and what a miserably small share of it most people appropriate. Why, there are men in my village who have never been outside the county and seldom out of the township; who have never heard a word of any language but English; never seen a city or a mountain or the ocean—or, indeed, any body of water bigger than Fresh Pond or the Hogganum River; never been in a theater, steam-boat, library, or cathedral. Cathedral! Their conception of a church is limited to the white wooden meeting-house at 'the center.' Their art-gallery is the wagon of a traveling photographer. Their metropolitan hotel is the stoop and bar-room of the 'Uncas House.' Their university is the unpainted school-house on the hill. Their literature is the weekly newspaper from the county town. But take the majority of educated men even. What a rusty, small kind of existence they lead! They are in a rut, just the same as the others, only the rut is a trifle wider. If I had my way I would never do the same work or talk with the same people—hardly live in the same place for two days running. Life is too short to do a thing twice. When I come to the end of mine I don't want to say *J'ai manqué la vie;* but make my brag, with the Wife of Bath,

> 'Unto this day it doth myn herte bote
> That I have had my world as in my time.'"

"Well, how are you going to do all those fine things?" inquired Armstrong. "For instance, that about not living in one place two days running. I'm afraid you'll find that inconvenient, not to say expensive."

"Oh, you mustn't take me too literally. I may have to travel on foot or take a steerage passage, but I shall keep going all the same. I haven't made any definite plans yet. I shall probably strike for something in the diplomatic line,—secretary of legation, or some small consulship perhaps. But the principle is the main thing, and the principle is: Don't do anything because it's the nearest and easiest and most obvious thing to do, but make up your mind to get the best. Look at the lazy way in which men accept their circumstances. There is the matter of acquaintance, for instance—we let chance determine it. We know the men that we can't help knowing,—the ones in the next house, cousins and second cousins, business connections, etc. Here at college, now, we get acquainted with the fellows at the eating club or in the same society, or those who happen to sit next us in the class-room, because their names begin with the same letter. That's it; it's just a sample of our whole life. Our friendships, like everything else about us, are determined by the alphabet. We go with the Z's because some arbitrary system of classification has put us among them, instead of fighting our way up to the A's, where we naturally belong. The consequence is that one's friends are mostly dreadful bores."

"I'm sure we are all much obliged to you," murmured Clay, parenthetically.

"There are about two or three thousand people in the world," continued Berkeley, "supremely worth knowing. Why shouldn't *I* know them? —— I will! Everybody knows two or three thousand people,—mostly very stupid people,—or, rather, he lets them know him. Why shouldn't he use some choice in the matter? Why not know Thackeray and Carlyle, Lord Palmerston and the Pope, and the Emperor of China and all the great statesmen, authors, African explorers, military commanders, artists, hereditary nobles, actresses, wits and belles of the best society, instead of putting up with Tom, Dick, and Harry?"

"Berkeley, 'with whom the bell-mouthed

flask had wrought!'" exclaimed Clay. "Decidedly, Berk, you should take your coffee without cognac."

"Let me suggest," put in Doddridge, "that some of those parties you mentioned are not so easy to get introductions to."

"Oh, I say again, you mustn't take me too literally. But even the top swells are easier to know than you think. All that is wanted is a little cheek. But take it in a smaller way; say that we resolve to cultivate the best society within our reach. Doubtless there are numbers of interesting and distinguished people right here in New Haven whose acquaintance it would be worth while to have. But how long would you beggars live here without making the least effort to look them out, and meanwhile put up with the same old every-day bores—like me, or Polisson here? And it's the same way with marriage. A fellow blunders into matrimony with the first attractive girl that gives him the opportunity. He knows, if he takes the time to think about it, that there are a thousand others better than she, if he will wait and look through the world a little. 'Juxtaposition in fine,' as Clough says."

"Of course, with such a brilliant destiny before you, *you'll* never marry," said I.

"Yes, I think I shall. I fancy that the noblest possibilities of life are never realized without marriage. Yes, I can think of nothing finer than to have a lot of manly boys and sweet girls growing up around one. But when I marry it shall be so as to give completeness and expansion to life, not narrowness and dullness. I shall never marry and settle down. Settle down! What a damnable expression that is! A man ought to settle *up*. I mean to have my fling first, too. I should like to gamble a bit at Baden-Baden. I should like to go out to Colorado and have a lick at mining speculations. I want to rough it some too, and see how life is lived close to the bone: ship for a voyage before the mast; enlist for a campaign or two somewhere and have joy of battle; join the gypsies or the Mormons or the Shakers for awhile, and taste all the queerness of things. And then I want to float for another while on the very topmost crest of society. I want to fight a duel or two, elope with a marquise, do a little of everything for the experience's sake, as a man ought to take opium once in his life just to know how it feels."

Whether it was indeed the cognac, or only the unusual excitement attending this outburst of pent-up fire, Berkeley's cheek had got a flush upon it. Perhaps, too, it was owing to the influences of the day and the hour, the splash of the fountain, the rustle of the vine-leaves, and the wavering shadows which played about the court-yard as the gas-jets flickered in the breeze of night, that made his boastful words seem less extravagantly out of character than they otherwise would. The silence which followed his speech was broken by Clay, who sat with his foot on the rim of the fountain, balancing on the hind legs of his chair, and looking thoughtfully at the slender jet as it rose and fell. He still wore the dress suit in which he had figured on the Commencement platform in the afternoon, and which set off the aristocratic grace of his slight figure. There was a pale intellectual light in his face, and his black eyes had the glow of genius.

"I think," he began, "that Berkeley makes a mistake in confounding a full life with a restless one. I believe in a full experience too, but the satisfactions should be inward ones. Take the matter of foreign travel, for one thing, on which you lay so much stress. It is a great stimulus to the imagination, no doubt; but then foreign countries are accessible to the imagination by other means,—through books and art, for example. I think it likely that the reality is, quite as often as not, disappointing. Place, after all, is indifferent. 'The soul is its own place': you can't get rid of yourself by going abroad, and it's himself that a man gets sooner tired of than of anything else. Then as to acquaintances, I don't know that I should care to know personally such men as Thackeray and Carlyle, and the big composers and artists and other people that you mentioned. It might be equally disenchanting. They put the best of themselves into their books, or pictures, or music. I certainly would not seek their society through a formal introduction, at all events. It is hard for a small man to keep his self-respect in face of a great man when he obtains his acquaintance as a special favor. If I could meet some of those fellows, quite naturally and accidentally, on equal terms, I might like it, but not otherwise. But, leaving that point out of account, I think that the career which Berkeley proposes to himself would turn out very hollow. It would result in the superficial gratification of the curiosity and the senses; and, as soon as the novelty got rubbed off, what is there left?"

"So then," said Berkeley, "you've swung into line with Armstrong, have you? You mean to plod along in some professional rut too. What has got into all our idealists?"

"Not by any means," answered Clay. "Armstrong talks about independence, and yet destines himself to the worst kind of dependence — slavery to money-getting.

Most people, it seems to me, spend the best part of their lives not in living, but in getting the means to live. We'll give Armstrong, say twenty years, to lay up enough money to retire on and begin to live. What sort of a position will he be in then to enjoy his independence? His nature will have got so subdued to what it works in that the only safety for him will be to keep on at the law."

"All right! Then I'll keep on," interjected Armstrong.

"What the devil do *you* mean to do then?" asked Berkeley of Clay.

"I don't quite know yet," replied the latter. "I shall 'loaf and invite my soul' whenever I feel like it. I shall live as I go along, and not postpone it till I am forty. I sha'n't put myself into any mill that will grind me just so much a day. I need my leisure too badly for that. I presume I shall spend most of my time at first in reading and walking. Then, whenever I think of anything to write I shall write it, and if I can sell what I write to some publisher or other so much the better. If not, go on as before."

"Meanwhile, where will your bread and butter come from?" asked Armstrong.

"Oh, I sha'n't starve. I can get some sort of hack work,—something that wont take much of my time, and which I can do with my left hand. But the great point, after all, is to make your wants simple; to live like an Arab, content with a few dates and a swallow from the gourd. 'Lessen your denominator.' It's easier than raising your numerator, and the quotient is the same."

"No, it's not the same," Berkeley retorted. "Renunciation and enjoyment are not the same. It makes a heap of difference whether you have a thing or simply do without it. The plain living and high thinking philosophy may do for Clay, whose mind to him a kingdom is; but a fellow like me, whose mind is only a small Central American republic, can't live on the revenues of the spirit. The fact is, Clay, you've read too much Emerson. I went into that myself once, but I soon found out that it wouldn't wear. I want mine thicker. The worst thing about the career of a literary man or an artist is that if he fails there are no compensations; and success is mighty uncertain. Nobody doubts that you are smart enough, Clay, and I am sure we expect great things of you, whatever line you take up. But, for the sake of the argument, suppose you have grubbed along in a small way, living on crusts and water, till you are fifty, without doing any really good work. Then where are you? You haven't had any fun. You've no other string to your bow. You haven't that practical experience of the world which would enable you to turn your hand to something else. You have no influence or reputation; for, of all poor things, poor art of any kind is the worst —hateful to gods and men and columns. In short, where are you? You're out of the dance; you don't count."

"Yes," added Armstrong, "and you've no professional success or solid standing in the community; and, what's worse, you've no money, which might make up for the want of all the rest."

"I don't think you get my meaning. I may fail," said Clay, proudly; "I may never even try to succeed, in your sense of the word. I decline all mean competitions and all low views of success. The noblest ideal of life—at least, the noblest to me—is self-culture in the high meaning of the word; the harmonious development of one's whole nature. Armstrong has drawn a picture of his future in the likeness of old Tulkinghorn. I suppose we are all accustomed to put our anticipations into some such concrete shape before our mind's eye. The typical situation which I am fond of imagining is something like this: I like to fancy myself sitting in a dark old upper room in some remote farm-house, at the close of a winter day, after three or four hours of steady reading or writing. The room is full of books —the *best* books. There is a little fire on the hearth, there is a dingy curtain at the window. It is solitary and still, and when the light gets too scant to let me read any more, I fill my pipe, and go and stand in the window. Outside, there is a row of leafless elms, and beyond that a dim, wide landscape of lakes and hills, and beyond that a red, windy sunset. I can sit in that window and smoke my pipe and have my own thoughts till the hills grow black. There is no one to say to me 'Go' or 'Come'; no patient to visit; no confounded case on the docket next morning at nine; no distasteful, mean, slavish job of any kind. How can I fail to have thoughts worth the thinking, and to live a rich and free life when I breathe every day the bracing air of nature and the great poets? Isn't such a life in itself the best kind of success, even if a man accomplishes nothing in particular that you can put your hand on?"

"Yes, I know," said Armstrong, taking a long breath. "I have felt that way too. But a man has got to put all that sternly behind him and do the world's work for the world's wages, if he means to amount to anything. It's only a finer kind of self-indulgence, after all—egoistic Hedonism and that sort of thing."

"It wont be all standing at windows and looking at sunsets," added Doddridge. "Has

it ever occurred to you that, before entering on a life of self-denial and devotion to rather vague ideals, a man ought to be mighty sure of himself? Can you keep up the culture business without growing in on yourself unhealthily, and then getting sick of inaction? Don't you think there will be times of disappointment and doubt when you look around and see fellows without half your talents getting ahead of you in the world?"

"Of course," answered Clay, "I shall have to make sacrifices, and I shall have to stick to them when made. But there have always been plenty of people willing to make similar sacrifices for similar compensations. Men have gone out into the wilderness or shut themselves up in the cloister for opportunities of study or self-communion, or for other objects which were perhaps at bottom no more truly devotional than mine. Nowadays such opportunities may be had by any man who will keep himself free from the servitude of a bread-winning profession. It is not necessary now to cry *Ecce in deserto* or *Ecce in penetralibus*. Oh, I shall have my dark days; but whenever the blue devils get thick I shall take to the woods and return to sanity."

"You mean to live in the country, then?" I inquired.

"Yes; most of the time, at any rate. Nature is fully half of life to me."

Again there was a pause.

"Well, you next, Polisson," said Armstrong, finally. "Let's hear what your programme is."

"Oh, nothing in the least interesting," I replied. "My future is all cut and dried. I shall spend the next two years in the south of France—mainly at Lyons—to learn the details of the silk manufacture. Then I shall come home to go into my father's store for a year as a clerk in the importing department. At the close of that year the governor will take me in as junior partner, and I shall marry my second cousin. We shall live with my parents, and I am going to be very domestic, though, as a matter of form, I shall join one or two clubs. I shall go down town every morning at nine, and come up at five."

"Quite a neat little destiny," said Armstrong. "I wish I had your backing. Come, Dodd, what's yours? You're the only man left."

"I haven't made up my mind yet," said Doddridge, slowly.

He was a large, spare man, with a swarthy skin, a wide mouth, a dark, steady eye, and a long jaw. There was an appearance of power and will about him which was well borne out by his character. He had been a systematic though not a laborious student, and while maintaining a stand comfortably near the head of the class, had taken a course in the Law School during Senior year, doing his double duties with apparent ease. He was a constant speaker in the debates of the Linonian Society, and the few who attended the meetings of that moribund school of eloquence spoke of Doddridge's speeches as oases in the waste of forensic dispute, being always distinguished by vigor and soundness, though without any literary quality, such as Clay's occasional performances had. Berkeley, who covered his own lazy and miscellaneous reading with the mask of eclecticism, and proclaimed his disbelief in a prescribed course of study, was wont to say that Doddridge was the only man that he knew who was using the opportunities given by the college for all they were worth, and really getting out of "the old curric" that mental discipline which it professed to impart. Though rather taciturn, he was not unsocial, and was fond of his pipe in the evening. He liked a joke, especially if it was of a definite kind, and at some one's expense touching a characteristic weakness of the man. There was at bottom something a little hard about him, though every one agreed that he was a good fellow. We all felt sure that he would make a distinguished success in practical life; and we doubtless thought—if we thought about it at all—that with his clear foresight and habits of steady work, he had already decided upon his career. His words were therefore a surprise.

"What! you don't mean to say that you are going to drift, Dodd?" inquired Armstrong.

"Drift? Well, no; not exactly. I shall keep my steering apparatus well in hand, but I haven't decided yet what port to run for. There's no hurry. I have an uncle in the Northwest in the lumber business, who would give me a chance. I may go out there and look about awhile at first. If it doesn't promise much, there is the law to fall back upon. My father has a fruit farm at Byzantium in western New York,—where I come from, you know,—and he is part owner of the Byzantium weekly 'Bugle.' I've no doubt I could get on as editor, and go to the legislature. Or I might do worse than begin on the farm; farming is looking up in that section. I may try several things till I find the right one."

"That's queer," said Armstrong. "I thought you had made up your mind to enter the Columbia Law School."

"Hardly," answered Doddridge, "though I may, after all. The main point is to keep yourself in readiness for any work, and take the best thing that turns up—like Berkeley here," he added, drily.

Armstrong looked at his watch and remarked that it was nearly midnight.

"Boys," said I, "in fifteen years from to-night let's have a supper here and see how each man of us has worked out his theory of life, and how he likes it as far as he has got."

"Oh, give us twenty," said Doddridge, laughing, as we all arose and prepared to break up. "No one accomplishes anything in this latitude before he is forty."

* * * * * * *

It was in effect just fifteen years from the summer of our graduation that I started out to look up systematically my quondam classmates and compare notes with them. The course of my own life had been quite other than I had planned. For one thing, I had lived in New Orleans and not in New York, and my occasions had led me seldom to the North. The first visit I paid was to Berkeley. I had heard that he was still unmarried, and that he had been for years settled, as minister, over a small Episcopal parish on the Hudson. The steamer landed me one summer afternoon at a little dock on the west bank; and after obtaining from the dock-keeper precise directions for finding the parsonage, I set out on foot. After a walk of a mile along a road skirted by handsome country seats, but contrasting strangely in its loneliness with the broad thoroughfare of the river constantly occupied by long tows of barges and rafts, I came to the rectory gate. The house was a stone cottage, covered with trailers, and standing well back from the road. In the same inclosure, surrounded by a grove of firs, was a little stone chapel with high pitched roof and rustic belfry. In front of the house I spied a figure which I recognized as Berkeley. He was in his shirt sleeves, and was pecking away with a hoe at the gravel walk, whistling meanwhile his old favorite 'Bonny Doon.' He turned as I came up the driveway, and regarded me at first without recognition. He, for his part, was little changed by time. There was the same tall, narrow-shouldered, slightly stooping figure; the face, smooth-shaved, with a spot of wintry red in the cheek, and the old humorous cast in the small blue eyes.

"You don't know me from Adam," I said, pausing in front of him.

"Ah!" he exclaimed, directly. "Polisson, old man, upon my conscience I'm glad to see you, but I didn't know you till you spoke. You've been having the yellow fever, haven't you? Come in—come into the house."

We passed in through the porch, which was covered with sweet-pea vines trained on strings, and entered the library, where Berkeley resumed his coat. The room was lined with book-shelves loaded to the ceiling, while piles of literature had overflowed the cases and stood about on the floor in bachelor freedom. After the first greetings and inquiries, Berkeley carried my valise upstairs, and then returning, said:

"I'm a methodical though not methodistical person, or rather parson (excuse the Fullerism); and as you have got to stay with me till I let you go, that is, several days at the least (don't interrupt), I'll keep a little appointment for the next hour, if you will excuse me. A boy comes three times a week to blow the bellows for my organ practice. Perhaps you would like to step into the church and hear me."

I assented, and we went out into the yard and found the boy already waiting in the church porch. Berkeley and his assistant climbed into the organ loft, while I seated myself in the chancel to listen. The instrument was small but sweet, and Berkeley really played very well. The interior of the little church was plain to bareness; but the sun, which had fallen low, threw red lights on the upper part of the undecorated walls, and rich shadows darkened the lower half. Through the white, pointed windows I saw the trembling branches of the firs. I had been hurrying for a fortnight past over heated railways, treading fiery pavements, and lodging in red-hot city hotels. But now the music and the day's decline filled me with a sense of religious calm, and for a moment I envied Berkeley. After his practicing was over the organist locked the chapel door, and we paced up and down in the fir-grove on the matting of dark-red needles, and watched the river, whose eastern half still shone in the evening light. After supper we sat out on the piazza, which commanded a view of the Hudson. Berkeley opened a bottle of Chablis and produced some very old and dry Manilla cheroots, and, leaning back in our wicker chairs, we proceeded to "talk Cosmos."

"You are very comfortably fixed here," I began; "but this is not precisely what I expected to find you doing, after your declaration of principles, fifteen years ago, you may remember, on our Commencement night."

"Fifteen years! So it is—so it is," he answered, with a sigh. "Well, *l'homme propose*, you know. I don't quite remember what it was that I said on that occasion: dreadful nonsense, no doubt. As Thackeray says, a boy *is* an ass. Whatever it was, it proceeded, I suppose, from some temporary mood rather than from any permanent conviction; though, to be sure, I slipped into this way of life almost by accident at first. But, being in, I have found it easy to continue. I am

rather too apt, perhaps, to stay where I am put. I am a quietist by constitution." He paused, and I waited for him to enter upon a fuller and more formal apology. Finally, he went on much as follows:

"Just after I left college I made application through some parties at Washington for a foreign consulate. While I was waiting for the application to be passed on (it was finally unsuccessful), I came up here to visit my uncle, who was the rector of this parish. He was a widower, without any children, and the church was his hobby. It is a queer little affair, something like the old field-kirks or chapels of ease in some parts of England. It was built partly by my uncle and partly by a few New York families who have country places here, and who use it in the summer. This is all glebe land," he said, indicating, with a sweep of his hand, the twilight fields below the house sloping down toward the faintly glimmering river. "My uncle had a sort of prescription or lien by courtesy on the place. There's not much salary to speak of, but he had a nice plum of his own, and lived inexpensively. Well, that first summer I moped about here, got acquainted with the summer residents, read a good deal of the time, took long walks into the interior,—a rough, aboriginal country, where they still talk Dutch,—and waited for an answer to my application. When it came at last, I fretted about it considerably, and was for starting off in search of something else. I had an idea of getting a place as botanist on Coprolite's survey of the Nth parallel, and I wrote to New Haven for letters. I thought it would be a good outdoor, horseback sort of life, and might lead to something better. But that fell through, and meanwhile the dominie kept saying: 'My dear fellow, don't be in too much of a hurry to begin. Young America goes so fast nowadays that it is like the dog in the hunting story,—a *leetle* bit ahead of the hare. Why not stay here for awhile and ripen—ripen?' The dominie had a good library,—all my old college favorites, old Burton, old Fuller, and Browne, etc., and it seemed the wisest course to follow his advice for the present. But in the fall my uncle had a slight stroke of paralysis, and really needed my help for awhile; that so what had been a somewhat aimless life, considered as loafing, became all at once a duty. At first he had a theological student, from somewhere across the river, come to stay in the house and read service for him on Sundays. But he was a ridiculous animal, whose main idea of a minister's duties was to intone the responses in a sonorous manner. He used to practice this on week days in his surplice, and I remember especially the cadence with which he delivered the sentence: 'Yea, like a broken *wall* shall ye be and as a ruined *hedge*.'

"He got the huckleberry, as we used to say in college, on that particular text, and it has stuck by me ever since. The dominie fired him out after a fortnight, and one day said to me: 'Jack, why don't *you* study for orders and take up the succession here? You are a bookworm, and the life seems to be to your liking.' Of course, I declined very vigorously in the beginning, though offering to stay on so long as the dominie needed my help. I used to do lay reading on Sundays when he was too feeble. Gradually, 'the idea of the life did sweetly creep into my study of imagination.' The quaintness of the place appealed to me. And here was a future all cut out for me: no preliminary struggle, no contact with vulgar people, no cut-throat competition, but everything gentlemanly and independent about it. I had strong doubts touching my theology, and used to discuss them with my uncle; but he said,—and said rightly, I now think,—'You young fellows in college fancy that it's a mighty fine, bold thing to affect radicalism and atheism, and the Lord knows what all; but it wont stick by you when you get older. Experience will soften your heart, and you'll find after awhile that belief and doubt are not matters of the pure reason, but of the will. It is a question of *attitude*. Besides, the church is broad enough to cover a good many private differences in opinion. It isn't as if you were going to be a blue-nosed Presbyterian. You can stay here and make your studies with me, instead of going into a seminary, and when you are ready to go before the bishop I'll see that you get the right send-off.' In short, here I am! My uncle died two years after, when I was already in orders, and I've been here ever since."

"I should think you would get lonely sometimes, and make a strike for a city parish," I suggested.

"Why—no, I don't think I should care for ordinary parish work. The beauty of my position here is its uniqueness. In winter I keep the church open for the Aborigines till they get snowed up and stop coming, and then I put down to New York for a month or two of work at the Astor Library. Last winter I held service for two Sundays running with one boy for congregation. Finally I announced to him that the church would be closed until spring.

"What in the ——: well, what do you find to do all alone up here?"

"Oh, there's always plenty to do, if you'll only do it. I've been cultivating some virtuosi-

ties, among other things. Remind me to show you my etchings when we go in. Did you notice, perhaps, that little head over the table, on the north wall? No? Then I smatter botany some. I'll let you look over my *hortus siccus* before you go. It has some very rare ferns; one of them is a new species, and Foster—who exchanges with me—swore that he was going to have it named after me. I sent the first specimen to have it described in his forthcoming report. But doubtless all this sort of thing is a bore to you. Well, lately I have been going into genealogy, and I find it more and more absorbing. Those piles of blank-books and manuscripts on the floor at the south end are all crammed with genealogical notes and material."

"I should think you would find it pretty dry fodder," I said.

"That is because you take an outside, unsympathetic view of it. Now, to an amateur it's anything but dry. There is as much excitement in hunting down a missing link in a pedigree that you have been on the trail of for a long time, as there is in the chase of any other kind of game."

"Do you ever get across the water? Travel, if I remember right, played a large part in your scheme of life once."

"Yes; I've been over once, for a few months. But my income, though very comfortable for the statics of existence, is rather short for the dynamics, and so I mostly stay at home."

"Did you meet any interesting people over there? Any of the crowned heads, famous wits, etc., whom you once proposed to cultivate?"

"No; nobody in particular. I went in a very quiet way. I had some good letters to people in England, but I didn't present them. The idea of introductions became a bore as I got nearer to it."

"And, of course, you didn't elope with the marquise?"

"Was that in my scheme? Well—no, I did not."

"You might have done worse, old man. You ought to have a wife, to keep you from getting rusty up here. And, besides, a fellow that goes so much into genealogy should take some interest in posterity. You ought to cultivate the science practically."

"Oh, I'm past all danger of matrimony now," said Berkeley, with a laugh. "There was a girl that I was rather sweet on a few years ago. I was looking up a pedigree for her papa, and I found that I was related to her myself, in eight different ways, though none of them very near. I explained it to her one evening. It took me an hour to do it, and I fancy she thought it a little slow. At all events, when I afterward hinted that we might make the eight ways nine, she answered that our relationship was so intricate already that she couldn't think of complicating it any further. No, you may put me down as safe."

After this, we sat listening in silence to the distant beat of paddle-wheels where a steamer was moving up river.

"The river is a deal of company," resumed my host. "Thirty-six steamers pass here every twenty-four hours. That now is the *Mary Powell*."

"Well," I said, answering not so much to his last remark as to the whole trend of his autobiography, "I suppose you are happy in this way of life, since you seem to prefer it. But it would be terribly monotonous to me."

"Happy?" replied Berkeley, doubtfully. "I don't know. Happiness is a subjective matter. You *are* happy if you think yourself so. As for me, I cultivate an obsolete mood—the old-fashioned humor of melancholy. I don't suppose now that a light-hearted, French kind of chap like you can understand, in the least, what those fine, crusty old Elizabethans meant when they wrote,

> 'There's naught in this life sweet,
> If man were wise to see't,
> But only melancholy.'

This noisy generation has lost their secret. As for me, I am content with the grays and drabs. I think the brighter colors would disturb my mood. I know it's not a large life, but it is a safe one."

I did not at the moment remember that this had been Armstrong's very saying fifteen years ago, but some unconscious association led me to mention him.

"Armstrong and you have changed places in one respect, I should think," said I. "He is keeping a boarding-school somewhere in Connecticut. And instead of leading a Tulkinghorny existence in the New York University building, as he firmly intended, he has married and produced a numerous offspring, I hear."

"Yes, poor fellow!" said Berkeley; "I fancy that he is dreadfully overrun and hard up. There always was something absurdly domestic about Armstrong. They say he has grown red, fat, and bald. Think of a man with Armstrong's education—and he had some talent, too,—keeping a sort of Dotheboys Hall! I haven't seen him for eight or nine years. The last time was at Jersey City, and I had just time to shake hands with him. He was with a lot of other pedagogues, all

going up to a teacher's convention, or some such dreary thing, at Albany."

I had an opportunity for verifying Berkeley's account of Armstrong a few days after my conversation with the former. The Pestalozzian Institute, in the pleasant little village of Thimbleville, was situated, as its prospectus informed the public, on "one of the most elegant residence streets, in one of the healthiest and most beautiful rural towns of Eastern Connecticut." Over the entrance gate was a Roman arch bearing the inscription "Pestalozzian Institute" in large gilt letters. The temple of learning itself was a big, bare, white house at some distance from the street, with an orchard and kitchen garden on one side, and a roomy play-ground on the other. The latter was in possession of some small boys, who were kicking a broken-winded foot-ball about the field with an amount of noise greatly in excess of its occasion. To my question where I could find Mr. Armstrong, they answered eagerly: "Mr. Armstrong? Yes, sir. You go right into the hall, and knock on the first door to the right, and he'll come—or some one."

The door to the large square entry stood wide open, and through another door opposite, which was ajar, I saw long tables, and heard the clatter of dishes being removed, while a strong smell of dinner filled the air. I knocked at the door on the right, but no one appeared. Finally, a chubby girl of about ten summers came running round the corner of the house and into the front door. She was eating an apple, and gazed at me wonderingly.

"Is Mr. Armstrong in?" I asked.

"Yes, sir; he's about somewhere. Walk into the parlor, please, and sit down, and I'll find him."

I entered the room on the right, which was a bleak and official-looking apartment,—apparently the reception-room where parents held interviews with the instructor of youth, or tore themselves from the parting embraces of homesick sons at the beginning of a new term. There is always something depressing about the parlor of an "institution" of any kind, and I could not help feeling sorry for Armstrong, as I waited for him, seated on a sofa covered with faded rep. At length the door of an inner room opened, and the principal of the Pestalozzian Institute waddled across the floor with his hand held out, crying:

"Franky Polisson, how are you?"

He certainly had grown stout, and his light hair had retreated from the forehead. He wore glasses and was dressed in a suit of rusty black, with a high vest which gave him a ministerial look—a much more ministerial look than Berkeley had. His pantaloons presented that appearance which tailors describe as "kneeing out." He sat down, and we chatted for half an hour. The little girl had followed him into the room, and behind her came another three or four years her junior. The older one stood by his side, and he kept his arm around her, while he held the younger on his knee. They were both pretty, healthy-looking children, and kept their eyes fixed on "the man."

"Are those your own kids?" I inquired presently.

"Yes, two of them. I have six,-you know," he answered, with a fond sigh: "five girls and one boy. The lasses are rather in the majority."

"I heard you were quite a *paterfamilias*," I said. "Wont you come and kiss me, little girl?"

To this proposal the elder answered by burying her head bashfully in her father's shoulder, while the smaller one simply opened her eyes wider and stared with more fixed intensity.

"Oh, by the way," exclaimed Armstrong, "of course you'll take tea with us and spend the evening. I wish I could offer to sleep you here; but the fact is, Mrs. Armstrong's sister is with us for a few days, and the parents of one of my boys, who is sick, are also staying here; so that my guest chambers are full."

"Don't mention it," I said. "I couldn't stay over night. I've got to be in New York in the morning, and must take the nine o'clock train. But I'll stay to supper and much obliged, if you are sure I sha'n't take up too much of your time."

"Not the least—not the least. This is a half holiday, and nothing in particular to do." He bustled to the door and called out loudly, "Mother! Mother!"

There was no response.

"Nelly," he commanded, "run and find your mamma, and tell her that Mr. Polisson—from New Orleans—an old classmate of papa's, will be here to tea. That's a good girl. Polisson, put on your hat and let's go round the place. I want to show you what an establishment I've got here."

We accordingly made the tour of the premises, Armstrong doing the cicerone impressively, and every now and then urging me with emphatic hospitality to come and spend a week—a fortnight—longer, if I chose, during the summer vacation.

"Bring Mrs. Polisson and the kids. Bring 'em all," he said. "It will do them good; the air here is fine; eleven hundred feet above the sea. No malaria—no typhoid. I laid

out four hundred dollars last year on sewerage."

It being a half holiday, most of the big boys had gone to a pond in the neighborhood for a swim, under the conduct of the classical master,—a Yale graduate, Armstrong explained, who had stood fourth in his class, "and a very able fellow,—very able."

But while we sat at tea in Armstrong's family dining-room, which adjoined the school commons, we were made aware of the return of the swimming party by the constant shuffle and tramp of feet through the hall and the noise of feeding in the next room. At our table were present Mrs. Armstrong, her sister (who had a frightened air when addressed and conversed in monosyllables), the parents of the sick pupil, and Armstrong's two eldest children. I surmised that the younger children had been in the habit of sharing in the social meal, and had been crowded out on this occasion by the number of guests; for I heard them *fremunt*ing *in carcere* behind a door through which the waitress passed out and in, bringing plates of waffles. The remonstrances of the waitress were also audible, and, when the wailing rose high, my hostess's face had a distrait expression, as of one prepared at any moment for an irruption of infant Goths.

Mrs. Armstrong was a vivacious little woman, who, I conjectured, had once been a village belle, with some pretensions to *espièglerie* and the fragile prettiness common among New England country girls. But the bearing and rearing of a family of children, and the matronizing of a houseful of hungry school-boys in such a way as to make ends meet, had substituted a faded and worried look for her natural liveliness of expression. She bore up bravely, however, against the embarrassments of the occasion. In particular, it pleased her to take a facetious view of college life.

"Oh, Mr. Polisson," she cried, "I am afraid that you and my husband were very gay young men when you were at college together. Oh, don't tell me; I know—I know. I've heard of some of your scrapes."

I protested feebly against this impeachment, but Armstrong winked at me with the air of a sly dog, and said:

"It's no use, Polisson. You can't fool Mrs. A. Buckingham and one or two of the fellows have been here to dinner occasionally, and I'm afraid they've given us away."

"Yes," she affirmed, "Mr. Buckingham was one of you too, I guess, though he *is* the Rev. Mr. Buckingham now. Oh, he has told me."

"You remember old Buck?" put in Armstrong. "He is preaching near here—settled over a church at Bobtown."

"Yes," I answered, "I remember there was such a man in the class, but really I didn't know that he was—ah—such a character as you seem to infer, Mrs. Armstrong."

"Oh, he has quieted down now, I assure you," said the lady. "He is as prim and proper as a Methodist meeting-house. Why, he *has* to be, you know."

This amusing fiction of the wildness of Armstrong's youth had evidently become a family tradition, and even, by a familiar process, an article of belief in his own mind. It reminded me grotesquely of *Justice Shallow's* reminiscences with *Sir John Falstaff:* "Ha, Cousin Silence, that thou hadst seen that, that this knight and I have seen. * * * Jesu, Jesu, the mad days that I have spent!"

The resemblance became still stronger when, as we rose from the table, the good fellow beckoned me into a closet which opened off the dining-room, saying, in a hoarse whisper:

"Here, Polisson, come in here."

He was uncorking a large bottle half-filled with some red liquid, and as he poured a portion of this into two glasses he explained:

"I don't have this sort of thing on the table, you understand, on account of the children and my—ah—position. It would make talk. But I tell you this is some of the real old stuff. How!" And he held his glass up to the light, regarding it with the one eye of a connoisseur, and then drank down its contents with a smack. I was considerably astonished, on doing the same, to discover that this dark beverage—which, from Armstrong's manner, I had been prepared to find something at least as wicked as absinthe—was simply and solely Bordeaux of a mild quality. After this Bacchanalian proceeding we went out into the orchard, which was reserved for family use, and sat on a bench under an apple-tree. Armstrong called his little boy who had been at supper with us and gave him a whispered message, together with some small change. The messenger disappeared, and after a short absence returned with two very domestic cigars, transparently bought for the nonce from some neighboring grocer. "Have a smoke," commanded my host, and we solemnly kindled the rolls of yellow leaf, Armstrong puffing away at his with the air of a man who, though intrusted by destiny with the responsibility of molding the characters of youth, has not forgotten how to be a man of the world on occasion.

"Well, Charley," I began, after a few preliminary draughts, "you seem to have a good thing of it. Your school is prosperous, I un-

derstand; the work suits you; you have a mighty pretty family of children growing up, and your health appears to be perfect."

"Yes," he admitted; "I suppose I ought to be thankful. I certainly enjoy great mercies. It's a warm, crowded kind of life; plenty of affection,—plenty of anxiety too, to be sure. I like to have the boys around me; it keeps one's heart fresh, though in a way it's sometimes wearing to the nerves. Yes, I like the young rascals—I like them. But, of course, it has its drawbacks. Most careers have," he added, in a burst of commonplace.

"It is not exactly the career that you had cut out for yourself," I suggested, "when we talked our plans over, you remember, that last evening at New Haven."

"No, it's not," he acknowledged; "but perhaps it is a better one. What was it I said then? I really don't recall it. Something very silly, no doubt."

"Oh, you said, in a general way, that you were going in for money and celibacy and selfishness,—just as you have *not* done."

"Yes, yes; I know, I remember now," he said, laughing. "Boys are great fools with their brag of what they are going to do and be. Life knocks it out of them fast enough; they learn to do what they must."

"Do you ever write any poetry nowadays?"

"No, no; not I. The muse has given me the go-by completely. Except for some occasional verses for a school festival or something of the kind, which I grind out now and then, I've sunk my rhyming dictionary deeper than ever plummet sounded. The chief disadvantage of running a big school like this," he continued, with a sigh, "is the want of leisure and retirement to enable a man to keep up his studies. Sometimes I actually ache for solitude,—for a few weeks or months of absolute loneliness and silence. Mrs. Armstrong has fixed me up a nice little private study,—remind me to take you in there before you go,—where I keep my books, etc. But the children will find their way in, and then I'm seldom undisturbed anywhere for more than an hour at a time; there's always some call on me,—something wanted that no one else can see to."

"You ought to swap places with Berkeley for awhile. He's got more leisure than he knows what to do with."

"Berkeley! Well, what's he up to now? Philately? Arboriculture? What's his last fad? You've seen him lately, you said. I met him for a minute in New York, a few years ago, and he told me he was going to an old book auction."

"He's got genealogy at present," I explained.

"Genealogy! What hay! What sawdust! Aren't there enough live people to take an interest in, without grubbing up dead ones from tombstones and town clerks' records? Berkeley must be a regular old bachelor antiquary by this time, with all human sympathy dried out of him. No, I wouldn't change with *him*. Would we, fatty?" he said, appealing to a small offspring of uncertain sex which had just toddled out the door and across the gangway to kiss its papa good-night.

I took leave of Armstrong and his interesting family with a sense of increased liking. His unworldliness, good nature, and simple little enthusiasms and self-satisfactions had somehow kept him young, and he seemed quite the old Armstrong of college days. I afterward learned that the excellent fellow had just finished his law studies, and was preparing to enter upon practice, when his father's health failed, forcing him to give up his parish, and leaving a number of younger brothers and sisters partly dependent on Armstrong. He had accordingly taken the first situation that promised a fair salary, and, having got started upon the work of teaching, had been unable to let go until it was too late; had, indeed, got deeper and deeper in, by falling in love and impulsively marrying at the first opportunity, and finally setting up for himself at the Pestalozzian Institute. Poor fellow! Good fellow! *Amico mio, non della fortuna.*

My next call was upon Clay, who had rooms in the Babel building in New York, and was reported to be something of a Bohemian. He received me in a smoking jacket and slippers. He had grown a full beard which hid his finely cut features. His black eyes had the old fire, but his skin was sallower, and I thought that his manner had a touch of listlessness mingled with irritability and defiance. He was glad to see me; but inclined to be at first, not precisely distant, yet by no means confidential. After awhile, however, he thawed out and became more like the Clay whom I remembered,—our college genius, the brilliant, the admired, in those days of eager hero-worship. I told him of my visits to Berkeley and Armstrong.

"Berkeley I see now and then in town," said Clay. "It was rather queer of him to turn parson, but I guess he doesn't let his theology bother him much. He has a really superior collection of etchings, I am told. Armstrong I haven't seen for years. I knew he was a pedagogue somewhere in Connecticut."

"Don't you ever go to the class reunions?" I asked.

"Class reunions? Well, hardly."

"I should think you would; you are so near New Haven."

"How charmingly provincial you are—you Southern chaps! Don't you know that, to a man who lives in New York, nothing is near? Besides, as to my classmates at old Yale and all that, I would go round a corner to avoid meeting most of them."

I expressed myself as duly shocked by this sentiment, and presently I inquired:

"Well, Clay, how are you getting on, anyway?"

"That's a d—— general question. How do you want me to answer it?"

"Oh, not at all, if you don't like."

"Well, don't get miffed. Suppose I answer, 'Pretty well, I thank you, sir.' How will that do?"

"Are you writing anything now?"

"I'm always scribbling something or other. At present, I've got the position of dramatic critic on the 'Daily Boreas,' which is not a very bad bore, and keeps the pot boiling. And I do more or less work of a hack kind for the magazines and cyclopedias, etc."

"I thought you were on the 'Weekly Prig.' Berkeley or somebody told me so."

"So I was at one time, but I got out of it. The work was drying me up too fast. The concern is run by a lot of cusses who have failed in various branches of literature themselves, and undertake, in consequence, to make it unpleasant for every one else who tries to write anything. I got so that I could sling as cynical a quill as the rest of them. But the trick is an easy one and hardly worth learning. It's a great fraud, this business of reviewing. Here's a man of learning, for instance, who has spent years of research on a particular work. He has collected a large library, perhaps, on his subject; knows more about it than any one else living. Then along comes some insolent little whipper-snapper,—like me,—whose sole knowledge of the matter in hand is drawn from the very book that he pretends to criticise, and patronizes the learned author in a book notice. No, I got out of it; I hadn't the cheek."

"I bought your book," * said I, "as soon as it came out."

"That's more than the public did."

"Yes, and I read it, too."

"No! Did you, now? That's true friendship. Well, how did you like it? Did you get your money's worth?"

I hesitated a moment and then answered:

"It was clever, of course. Anything that you write would be sure to be that. But it didn't appear to get down to hard-pan or to take a firm grip on life—did it?"

"Ah, that's what the critics said,—only they've got a set of phrases for expressing it. They said it was amateurish, that it was in a falsetto key, etc."

"Well, how does it strike you, yourself? You know that it didn't come out of the deep places of your nature, don't you? You feel that you've got better behind?"

"Oh, I don't know. A man does what he can. I rather think it's the best I can do at present."

"Why don't you go at some more serious work; some *magnum opus* that would bring your whole strength into play?"

"A *magnum opus*, my dear fellow!" replied Clay, with a shade of irritation in his voice. "You talk as if a *magnum opus* could be done for the wishing. Why don't *you* do a *magnum opus*, then?"

"Why don't *I*? Oh, I'm not a literary fellow—never professed to be. What a question!"

"Well, no more am I, perhaps. I don't think any better of the stuff that I scribble than you do. It's all an experiment with me. I'm trying my brushes—trying my brushes. Perhaps I may be able to do something stronger some day, and perhaps not. But at all events I sha'n't force my mood. I shall wait for my inspiration. One thing I've noticed, that as a man grows older he loses his spontaneity and gets more critical with himself. I could do more, no doubt, if I would only let myself go. But I'm like this meerschaum here,—a hard piece and slow in coloring."

"Well, meanwhile you might do something in the line of scholarship, a history or a volume of critical essays—'Hours with the Poets,' or something of that kind, that would bring in the results of your reading. Have you seen Brainard's book? It seemed to me work that was worth doing. But you could do something of the same kind, only much better, without taking your hands out of your pockets."

Brainard was a painstaking classmate of ours, who had been for some years Prefessor of Mental and Moral Philosophy, English Literature, and European History, in a western university, and had recently published a volume entitled "Theism and Pantheism in the Literature of the English Renaissance," which was well spoken of, and was already in its third edition.

"Yes, I've seen the stuff," said Clay. "My unhappy country swarms with that sort of thing: books about books, and books about other books about books,—like the big fleas and little fleas. It's not literature; it's a para-

* Dialogues and Romances. By E. Clay. New York: Pater & Sons, 1874.

sitic growth that infests literature. I always say to myself, with the melancholy Jaques, whenever I have to look over a book by Brainard or any such fellow, 'I think of as many matters as he; but I give Heaven thanks and make no boast of them.' No, I don't care to add anything to that particular rubbish heap. You know Emerson said that the worst poem is better than the best criticism of it. The trouble with me is that what I want to do I can't do — at present; what I can do I don't think it worth while to do — worth my while, at least. Some one else may do it and get the credit and welcome."

"But you do a good deal of work that you don't care about, as it is," I objected.

"Of course. A man must live, and so I do the nearest thing and the one that pays quickest. I got eighty dollars, now, for that last screed in 'The Reservoir.'"

"But," I persisted, "I thought that money-making had no part in your scheme. You could make more money in a dozen other businesses."

"So I could," he answered; "but they all involve some form of slavery. Now, I am my own master. After all, every profession has its drudgery, and literary drudgery is not the worst."

"Well," I conceded, "independent of what you accomplish, I suppose your way of life furnishes as many daily satisfactions as any. I sometimes envy you and Berkeley your freedom from business cares and your opportunities for study. What becomes of most men's college training, for example? By Jove! I picked up a Greek book the other day, and I couldn't read three words running. Now, I take it, you manage to keep up your classics, among other things."

"Oh, my way of life has its compensations," he answered. "But Sydney Smith — wasn't it? — said that life was a middling affair, anyway. As for the classics, etc., I find that reading and study lose much of their stimulus unless they get an issue in action, — unless one can apply them directly toward his own work. I often think that, if I were fifteen or even ten years younger, I would go into some branch of natural science. A scientific man always seems to me peculiarly happy in the healthy character of his work. He can keep himself apart from it. It is objective, impersonal, makes no demand on his emotions. Now a writing man has to put himself into his work. He has to keep looking out all the time for impressions, material; to keep trying to enlarge and deepen his own experience, and he gets self-conscious and loses his freshness in the process."

"I am surprised to find you in New York," said I, by way of changing the subject. "I thought you had laid out to live in the country. Do you remember that pretty little word-picture of a winter afternoon that you drew us — something in the style of an *Il Penseroso* landscape? I expected to find you domesticated in a Berkshire farm-house."

"Yes, I remember. I tried it. But I find it necessary, for my work, to be in New York. The newspapers — confound 'em! — wont move into the woods. But, after all, place is indifferent. See here; this isn't bad."

He drew aside the window curtain, and I looked out over a wilderness of roofs to the North River and the Palisades tinged with a purple light. The ferry-boats and tugs plying over the water in every direction, the noise of the steam whistles, and the clouds of white vapor floating on the clear air, made an inspiriting scene.

"I'm up among the architects here," continued Clay; "nothing but the janitor's family between me and the roof."

We talked awhile longer, and on taking leave, I said:

"I shall be on the lookout for something big from you one of these days. You know what we always expected of you. So don't lose your grip, old man."

"Who knows?" he replied. "It doesn't rest with me, but with the *daimon*."

I was unable to visit Doddridge, the remaining member of our group. He lived in the thriving town of Wahee, Minnesota, and I had heard of him, in a general way, as highly prosperous. He was a prominent lawyer and successful politician, and had lately been appointed United States district judge, after representing his section in the State Senate for a term or two. I wrote to him, congratulating him on his success and asking for details. I mentioned also my visits to Berkeley, Armstrong, and Clay. I got a prompt reply from Doddridge, from which I extract such portions as are material to this narrative:

"The first few months after I left college I traveled pretty extensively through the West, making contracts with the farmers as agent for a nursery and seed-farm in my part of the country, but really with the object of spying out the land and choosing a place to settle in. Finally I lit on Wahee, and made up my mind that it was a town with a future. It was bound to be a railroad center. It had a first-rate agricultural country around it, and a rich timber region a little further back; and it already had an enterprising little pop. growing rapidly. To-day Wahee is as smart a city of its inches as there is in the North-west. I squatted right down here, got a little raise from the old man, and put it all into building lots. I made a good thing of it, and paid it all back in six years with eight per cent. interest. Meanwhile, I went into Judge Pratt's law office and made my salt by fitting his boy for

college — till I learned enough law to earn a salary. The judge was an old Waheer — belonged to the time-honored aristocracy of the place, having been here at least fifteen years before I came. He got into railroads after awhile (is president now of the Wahee and Heliopolis Bee-line), and left his law practice to me. I married his daughter Alice in 1875. She is a Western girl, but she was educated at Vassar. We have two boys. If you ever come out our way, Polisson, you must put up with us for as long as you can stay. I would like to show you the country about here, and have you ride after my team. I've got a pair that can do it inside three minutes. Do you remember Liddell of our class? He is an architect, you know. I got him to come to Wahee, and he has all he can do putting up business blocks. We have got some here equal to anything in Chicago. * * *

"Yes, I am United States judge for this district. There is not much money in it, but it will help me professionally by and by. I shall not keep it long. Do I go into politics much, you ask. I used to, but I've got through for the present. The folks about here wanted to run me for Congress last term, but I hadn't any use for it. As to what you are kind enough to say about my 'success,' etc., whatever success I have had is owing to nothing but a capacity for hard work, which is the only talent that I lay claim to. They want a man out here who will do the work that comes to hand, and keep on doing it till something better turns up. * * *

"So Berkeley has turned out a dilettante instead of an African explorer. I heard he was a minister. He does not seem to have much ambition even in that line of life. I should think Armstrong had got the right kind of place for him. He was a good fellow, but never had much practical ability. You say very little about Clay. How is old 'Sweetness and Light,' any way? I saw some fluff of his in one of the magazines,— a 'romance' I think he called it. This is not an age for scribbling romances. The country wants something solider. I never took much stock in philosophers like Berkeley and Clay. There is the same thing the trouble with them both: they don't want to do any hard work, and they conceal their laziness under fine names,— culture, transcendentalism, and what not? '"Feeble and restless youths, born to inglorious days.'"

This letter may be supplemented by another, —say Exhibit B,— which I received from Clay not long after:

"My Dear Polisson: It occurs to me that your question the other day, as to how I was 'getting on,' did not receive as candid an answer as it deserved. I am afraid that you carried away an impression of me as of a man who suspected himself to be a failure, but had not the manliness to acknowledge it. You will say, perhaps, that there are all degrees of half success short of absolute failure. But I say no. In the career which I have chosen, to miss of success — pronounced, unquestionable success — is to fail; and I am not weak enough to hide from myself on which side of the line I fall. The line is a very distinct one, after all. The fact is, I took the wrong turning, and it is too late to go back. I am a case of arrested development — a common enough case. I might give plenty of excellent excuses to my friends for not having accomplished what they expected me to. But the world doesn't want apologies; it wants performance.

"You will think this letter a most extraordinary outburst of morbid vanity. But while I can afford to have you think me a failure, I couldn't let you go on thinking me a fraud. That must be my excuse for writing.

"Yours, as ever,

"*E. Clay.*"

This letter moved me deeply by its characistic mingling of egotism with elevation of feeling. As I held it open in my hand, and thought over my classmates' fortunes, I was led to make a few reflections. From the fact that Armstrong and Berkeley were leading lives that squarely contradicted their announced ideals and intentions, it was an obvious but not therefore a true inference that circumstance is usually stronger than will. Say, rather, that the species of necessity which consists in character and inborn tendency is stronger than any resolution to run counter to it.

Both Armstrong and Berkeley, on our Commencement night, had spoken from a sense of their own limitations, and in violent momentary rebellion against them. But, in talking with them fifteen years later, I could not discover that the lack of correspondence between their ideal future and their actual present troubled them much. It is matter of common note that it is impossible to make one man realize another's experience; but it is often quite as hard to make him recover a past stage of his own consciousness.

These, then, had bent to the force of chance or temperament. But Clay had shaped his life according to his programme, and had the result been happier? He who gets his wish often suffers a sharper disappointment than he who loses it. "*So täuscht uns also bald die Hoffnung, bald das Gehoffte,*" says the great pessimist, and Fate is never more ironical than when she humors our whim. Doddridge alone, who had thrown himself confidingly into the arms of the Destinies, had obtained their capricious favors.

I cannot say that I drew any counsel, civil or moral, from these comparisons. Life is deeper and wider than any particular lesson to be learned from it; and just when we think that we have at last guessed its best meanings, it laughs in our face with some paradox which turns our solution into a new riddle.

Henry A. Beers.

THE NATIVE ELEMENT IN AMERICAN FICTION.

BEFORE THE WAR.

"POETRY," Mr. Whipple finely says, "is the protest of genius against the unreality of actual life." This statement seems, in a measure, to be true of the best prose fiction: for the finest standard of emotion is hardly to be found actually embodied in any single person; it is a creation of the mind, an ideal, for which human life suggests the material,—a beautiful image to which we cling with all our secret forces,—not within the *actual*, nor yet wholly beyond the *possible*.

American fiction has passed through many stages since Charles Brockden Brown laid the foundation in 1798. In the early half of the present century the novelist was left free to range to the utmost verge of the possible: for the national sentiment welcomed anything in romance that gave evidence of imagination, paying for it any price in public esteem. The romancer found little competition at home, and had free range of the prizes, while abroad he had more than his share of attention, and if he grumbled, as he often did, it was, for the most part, the result of inordinate greediness engendered by unearned successes.

The *invention* of our early writers was quite equal to that of their English brothers, but in the choice and artistic disposition of material they were not held to so high a standard. Indeed, until the time of Hawthorne, it is difficult to find any rigidly conscientious work done in the department of fiction; and the magnificent success of novelists like Cooper seems due to their wealth of new matter, and to a certain breadth rather than delicacy of treatment—a gift of nature and not of art. To-day, the competition is great, and, by a process of critical selection, the artistic side of novel-writing has been developed, without, it would seem, any corresponding accession of imaginative power; so that the highest places are held by literary men who have but little creative force,—men who can strike an average, classify characters, and give a certain shape and body to their classifications, but cannot vitalize them with anything like spiritual vitality. The atmosphere of criticism is so largely tinctured with scholarship that fine writing is often credited with the essentials of fine imagination, and fine imagination, without the graces of style, has a hard time in getting a hearing. This is a natural reaction from the old excesses, where imagination was rank and art was slighted. The poverty of exacting criticism was lamentable. But the new process may well have its own excesses, and produce in time a new reaction.

Let us trace, as well as we can, the history of these changes in our fiction, and note the growth in it of a native as well as an artistic element. It was in Philadelphia that our first novelist was born. The third was from a remote corner of New England; but it is a little remarkable that both came of Quaker stock, and that each, by natural processes, ejected himself from the old faith. The second and fourth—if we pass by Irving, who coquetted with Fiction, but hardly entered the list of her suitors—were of Dutch and English extraction of the New York or New Jersey quality. The fifth and sixth, both women, were from Massachusetts. These six, in their order, were Charles Brockden Brown, James K. Paulding, John Neal, J. Fenimore Cooper, Miss Catherine M. Sedgwick, and Mrs. Lydia Maria Child. Mrs. Child's venture was a small one, confined to two meager volumes, published in 1824–25; while the other five writers held the entire ground of important novelistic literature for thirty-three years. Brown was sole occupant from 1798 to 1812, when Paulding—who, with Irving, had been skirmishing in "Salmagundi"—published "John Bull and Brother Jonathan." Five years later, John Neal rushed in with his first romantic venture,

> "Swingeing the scaly horror of his folded tail."

Cooper's "Precaution" followed in 1821; and in the next two years, "The Spy," "The Pioneers," and "The Pilot." Afterward, he became perennial, giving to the world one, two, sometimes three volumes a year, the best of which were translated into nearly every modern language in Europe.

Charles Brockden Brown, as we have said, was a mild Quaker, but the "Quaker" in him was thrust out by a severe attack of infidelity. Later in life came a more religious mood, and he died, says his biographer, a good Christian. John Neal, less fortunate, remained in the Quaker fold until his twenty-fifth year, when he knocked a man "head over heels," as it is phrased, and was turned out of meeting. Brown gravitated from Phila-

delphia to New York; Neal from Portland to Baltimore — thus preserving to New England her sober gravity, undisturbed by the school of fiction, until that gentle and delightful form of it introduced by Miss Sedgwick came to the Berkshire Hills.

Brown's early life was unmistakably gloomy. From a temperament delicate and fine, but morbid,—in which the intellectual overbalanced the physical forces,—sprang his first book, which, though stimulated from across the water, was wholly within the range of his mood and spirit. It contained, however, not a hint of the new American life, not a spark of that humor which afterward flashed freely in American literature. Except for an awful sense of solitude,—the gloom of primeval nature,—there was scarcely a touch of our glorious scenery. No social element is represented, such as Paulding afterward found in Philadelphia and New York, the centers of social activity between which Brown all his life oscillated. It was his peculiar gift to paint the night side of human experience. In "Wieland," his first novel, the story, though not wholly a tragedy, is so overwhelmingly black with the tragic element that the reader never for a moment emerges. In "Edgar Huntly," Clithero, the somnambulist, and Huntly himself, rest throughout under an incubus of horrors — fire, starvation, grave-haunting, sleep-walking, murder, wild beasts, and a nightmare of Indians. The same sense of solitude and dismay pervades the experience of Arthur Mervyn, who plunges from the couch of the plague to the cellar of the murderer, and only escapes to walk the hospitals. The power possessed by this rare genius, of throwing gloomy characteristics into his theme, was equaled by no other American writer. In the matter of morbid analysis, Poe, in comparison with Brown, was superficial, Hawthorne was cheerful, and the modern school of French writers are feeble. With Poe, we can see that the gloom came by an effort of a spurred imagination; with Hawthorne, that it was the work of an artistic sense; but with Brown, it seems to have been constitutional — the gift at once of temperament and circumstances. He was possessed by it: his early solitariness, his later experience in the two plague-stricken cities, combined with a most brooding and vivid imagination, had worked into the blood, so that we may reasonably believe that, substantially, Henry and Clara Wieland, Arthur Mervyn, Edgar Huntly, and even Jane Talbot, were but the incorporation of the author's own mental experiences. But Brown's novel-writing ended with his thirty-third year, and he died at thirty-nine. His six stories, compressed within seven years of his working life, were all the product of one mood in that period of life which, in such a man, lies between soul-experience and human action,—when the soul flowers, but has not reached a mellow fruitage; when imagination is boldest, and reason least assertive.

It was a long step from Brown's work to Paulding's first novelistic, or, rather, allegorical venture — "John Bull and Brother Jonathan." This tale is amateurish, but presents the first touches, in romance form, of that rich, broad humor which Paulding and Irving together introduced — the rollicking Dutch element, jovial and healthy, with no deep seriousness in it, and yet a manly fun half way between the grim playfulness of the south-west and the devout humor of the New Englander, who curtsied to the Almighty before making a joke. The Knickerbocker element, which comes to the front in Paulding's "Merry Tales," reaches its highest development in "The Dutchman's Fireside," published in 1831. The author's first four or five volumes mark a growing American sentiment in literature, a rasping sense of individual hostility to foreigners,—which was both social and political,—an almost ludicrous determination to show that the Declaration of Independence included a clause on literary independence. But beyond this, the work is loosely constructed, weak in dramatic interest, and of no credit whatever to American workmanship. Between the best of it and "The Dutchman's Fireside," which is mature work and of national value, the gulf is great. But before this novel was written, Irving had made a way for American invention, Cooper was full-fledged and delighting the world, Miss Sedgwick was charming the youth of New England and being reprinted abroad, and John Neal from Baltimore was plunging and caracoling in every field of literature.

"The Dutchman's Fireside" presented enough loose workmanship, but it was a most delightful introduction to the heart of Knickerbocker social life. The atmosphere was large and sunny, full of the grace of gentle culture and hearty manners, as well as of good living, —rich in the customs of colonial life, brilliant and warm with the golden foliage of American scenery. Paulding could tell a story charmingly. The action, at times, hurries along with rapidity, being full of incident,—natural, sympathetic, with the very cream of life in it. Again, the author will sink the novelist in the *raconteur*, and address a coterie. Presently, forgetting that he is not a preacher, he will give us a touch from the last pulpit. Anon he will be Addison, and the man about town. But one finds him oftenest following in the footsteps of Irving,—much inferior in the

graces of style,—uneven, inartistic, now edging himself among his characters, now changing natures with them,—so that we can hardly tell when we have Paulding, and when it is somebody else.

This trait is noticeable also in John Neal, whose "Keep Cool" followed five years after the "John Bull," and preceded Cooper's "Precaution" by four years. The three were "first" books, and represent merely the promise of their authors. Neal wrote from the surface of his mind, which was frothy. His life was mixed, and his novels were equally so. The very plot is erratic, sometimes intensely, almost luridly, dramatic, sometimes weak and attenuated beyond any reader's patience. As he had been shop-boy, dry-goods merchant, lawyer, poet, and essayist, as well as novelist, he considered himself qualified to lecture on all subjects. Now it is on the Yankee dialect, which he thinks no one understands so well as he. To illustrate his knowledge, he drags into "The Down-Easters," his cleverest book, two of the rankest of Yankees, and sets them to floundering in the plot. When they have ruined that to the extent of half a volume, we are plunged at once into a nest of horrors—dirking, drowning, seduction, desertion, adultery, poisoning. The whole is loose-jointed and extravagant, the dialogue spun out interminably, and amounting to nothing. So, also, in "Errata" we get relays of argument on Quaker customs, law, motherhood, the management of children, dueling, and murder. In "True Womanhood," written in his later years, and published in 1859, all his early buds are in over-ripe blossom. His own personality is pushed headlong into the text. He is gossippy, old-womanish. The style is slipshod, a perfect storm of words to the square inch of ideas, a huddle of incident and characters, with scarcely a clew to his purpose with them. Of the artistic element there is none whatever, no sense of proportion, no patient study of persons, no arrangement, no aim, and no fulfillment. There is only one character that clings to the mind, and that is John Neal—the universal Yankee, whittling his way through creation, with a half-genius for everything, a robust genius for nothing,—everything in the egg, and not a chick fully developed.

With the appearance of Cooper we began to hold up our heads among the romancers of the world. In literary form and workmanship he was far inferior to his great contemporaries abroad. He was utterly deficient in psychological analysis. Of broad humor he had only enough to hold his own in the second rank of his native State. Though he could draw very well a sailor's sweetheart, like Mary Pratt, or a soldier's daughter, like Mabel Dunham, yet of *fine* women he had only a chivalrous notion, and painted them from a respectful distance. They were delicate creatures, to be handled like porcelain. Dressed out and beautified, they were to be protected and worshiped. They walk through the halls of his heroes, and take seats at the upper end to distribute the prizes after the tournament. But in Paulding's Catalina there is more of the sprightly, lovely, living woman than in all the Frances Whartons, Elizabeth Temples, and Gertrude Greysons of Cooper's entire catalogue. The novelist's six years in the navy had made him a complete Jack Tar. He learned there to handle not only the ropes but the "yarn," and whatever he told, he told as "to the marines"; but he told it with such incredible confidence, and, withal, in such a chivalrous spirit, that he made us shut the eye of criticism and open the ear of faith. He never hesitated for a trick. On a pinch, he could extricate a hero or a heroine twenty times a day, each time by a different device. His *dramatis personæ* were as extravagant in their heroism or in their devotion as Dickens's persons were in their eccentricities. Yet, with all these limitations, he possessed a fine, robust sympathy and manliness, and a creative power equal to the best of the men abroad.

Easily superior to all our novelists in sea-tales, which required technical knowledge, and on the frontier, where his imagination had full play, he was in the delineation of the passions probably surpassed by Simms. There is a delightful transmissibility of blood in all his heroes. For instance, though there is no Long Tom Coffin anywhere else so admirably set forth as in "The Pilot," yet we have him cut up into parcels and distributed everywhere, under a white and under a black skin. He is at once the protector and servant of his master, delicate in his sensibilities and rough in his fists, quite competent to carry a cannon under his arm or a maiden on his shoulder—the ideal sailor, in short, combining strength, dogged faithfulness, and noble self-sacrifice with the most rugged and sometimes deformed exterior.

Two other persons, Chingachcook and the Pathfinder, Cooper created outright. The former, with Uncas to supplement him, is the ideal Indian—grave, silent, acute, self-contained, sufficiently lofty-minded to take in the greatness of the Indian's past, and sufficiently far-sighted to see the hopelessness of his future,—with nobility of soul enough to grasp the white man's virtues, and with inherited wildness enough to keep him true to the instincts of his own race. Probably at his first appearance, in "The Pioneers," this hero was a study from life. Afterward, when Cooper began to

present him in youth and manhood, the character was idealized; but the ideal is a noble one, worthy to stand for the heights of the savage nature — a god-send to the later romancers, who have never been able to escape from him. Chingachcook appears at his best, perhaps, but under another name, in "The Last of the Mohicans"; Natty Bumpo, in "The Pathfinder," where, with all his excellence as a representative frontiersman and scout, he unites in a most delicious and manly way the tender qualities of a lover. The scenes with Mabel Dunham, where he finally merges the lover in the paternal element, present the best range of sentiment that Cooper attained.

In the sea-tales, what strikes us as best is the management of "The Two Admirals." "The Red Rover" may do for the "marines"; the "Sea Lions" may come closer home to a sailor's experience and please us with its homespun and sensible Mary and its vigorously drawn Vineyard skipper, but the interplay of manly affection in the two admirals, and their reciprocity of self-sacrifice, indicate the largeness of Cooper's nature; while the handling of the two fleets, whatever the nautical critic may say of it, holds the interest of the landsman best. Again, Harvey Birch, in "The Spy," is perhaps a new creation from the actual; but the combination of the spy and the gentleman is so rare, and is put together in so dry an atmosphere of other incident, that it fails to satisfy. The social life in the old mansion of the Whartons is bare beside the social life which Mrs. Stowe, for example, depicts; while the autumnal glow of the Hudson River scenery never reaches the mellow beauty of autumn days on that noble stream, as painted by Irving and Paulding. Cooper's scenery everywhere, in fact, is indefinite, though often large and effective. Less real in "The Spy," he is marvelously successful in "The Prairie" and "The Pathfinder" in producing a sense of the primeval prairie and forest grandeur.

Cooper did not,

> "In years that bring the philosophic mind,"

become a philosopher, and one hardly likes to follow him through those rasping times when the spirit of patriotism led him to back up his countrymen abroad, only to back down upon them at home. There is no irritation so uncertain in its results as that of patriotism acting on a thin skin. The patriot who is without a cool philosophy becomes a public scold — abroad, for his country, and against her at home. Yet, however much the critical literary or patriotic spirit may attack Cooper for short-comings, he deepened the sentiment for America among the middle classes of the Old World, and created a genial atmosphere for us there, in which we may thriftily sun ourselves.

Following Cooper, in 1822, came Miss Catherine Sedgwick, who, in "A New England Tale," struck a new vein, and was welcomed earnestly. In "Redwood," two years later, and afterward in "Hope Leslie," "Clarence," "The Linwoods," etc., she took strong hold on the hearts of the New England youth. She was, with Mrs. Child, among the first to re-awaken the Puritan echoes and to paint that mildly wicked life around the "Boston Bay." She touched the Shaker craze at Lebanon, but in a constrained manner, as if it were too near home. It forms an episode, but not well incorporated, in her novel of "Redwood," whose Debby, however, must have been a study from life, and is racily rural and fairly comparable to Mrs. Stowe's New England women. Most of Miss Sedgwick's women, indeed, whatever be the formality and stiffness of their borrowed language, are delineated with spirit and interior knowledge, and though they share the romantic spirit of the heroines of that day, begin to show the qualities familiar to our experience. The author, like Paulding, was doing something to emancipate the American mind from foreign types — being in this original, and superior to Cooper, as she was truer to life than John Neal. In painting the scenery of Western Massachusetts, she is more successful in details than Cooper in like scenery, more nice and discriminating than Paulding, and has a charm of her own in simple, outlying country life. She is everywhere fertile in small devices, which will not always bear inspection, — changes the scene as often as she chooses, and scatters her dead along the line of march, gaining thereby in realism, but losing in intensity. She everywhere interests, but nowhere thoroughly absorbs the reader. Yet she was a worthy progenitress of a long line of most charming women novelists.

Mrs. Lydia Maria Child began her literary career with two novels, — "Hobomok," in 1824, and "The Rebels," a year later. The former burrows in colonial life about Salem, and is redolent of Indian and Puritan customs; the latter deals with Revolutionary history. Both are local, and show a mind tinged by colonial studies and steeped in the Puritan atmosphere. So far they are native work, but no stronger as stories than one would expect from a young woman of twenty-two. It is curious that, thirteen years after Mrs. Child, John Lothrop Motley, beginning in his twenty-fifth year, worked the same field — pursuing, in "Morton's Hope," the golden dream of youth

during the Revolutionary period about Boston, but losing himself anon in the note-books of a Göttingen student; later, in "Merry Mount," making a fair historical study of Thomas Morton and the Puritans, but with a dramatic interest only sufficient to indicate the strain he was to follow in his magnificent story of "The Dutch Republic."

While Mrs. Child and Miss Sedgwick were developing the early New England interest, William Leggett in New York was working the western mine, printing his "Rebels" with much success in the "Atlantic Souvenir." Otherwise,—with the exception of Richard P. Smith, who published "The Forsaken" in 1831,—Cooper, Neal, Paulding, and Miss Sedgwick held the entire field, publishing rapidly. New York, New England, and the "marines" got their fill of romance.

In the next five years there was an influx of fiction, most of it obscure, a little of it promising. Hawthorne wrote "Fanshawe," which he would gladly have had forgotten, and produced several of the short "Tales," afterward republished in England. John P. Kennedy appeared with "Swallow Barn," "Rob of the Bowl," and "Horse-Shoe Robinson," the latter his high-water mark. William Gilmore Simms brought out "Guy Rivers," "The Yemassee," and "The Partisan"; James Hall appeared with "Legends of the West"; Theodore S. Fay, with "Norman Leslie." Edgar A. Poe contributed many curious tales, all the work of the "Angel of the Odd," who was made up of bottles and casks, and poured out wine and hellebore until the sweet Maid of Fiction became a Bacchante. Richard Montgomery Bird came out with "Calavar" and "The Infidel"; James Lawson, with "Tales and Sketches by a Cosmopolite"; Hannah F. Lee, with "Grace Seymour"; and F. W. Thomas, with "Clinton Bradshaw"—a pretty prolific quinquennium altogether.

Three of these new writers—Kennedy, Simms, and Poe—were of the South, and introduced the lurid element. James Lawson brought a Scotchman's reminiscences to the wilds of the West. Fay had a mania for reform, and wrote cleverly for the young, but dismally for the grown-up reader. It is noticeable that the wickedness of "Gotham" was beginning to transpire about this period, and that it was mostly traceable to foreign counts and adventurers. There was a native innocence in the New York youth of both sexes that was pleasing to our pride. Fay thought it useful, however, to saturate his patient reader with home-made morality, and, like Neal, carried him through a full course of lectures on dueling, drinking, gambling, etc. The interest of the story slips away as the lecture lengthens. Thomas was more successful as a story-teller, and depicted New York social life in the early quarter of the century with considerable unction. His young people are interesting, and his conduct of the trial scene in "Clinton Bradshaw" is clever. But he, too, dabbles in politics, law reform, debating societies, and other public themes, until the work of the novelist is forgotten in that of the moralist.

James Hall introduced his reader to the gentler side of the Indian character; and Montgomery Bird, who was in all respects extravagant, but exciting, reached his height in "Nick of the Woods, or the Jibbenainosay,"—a book which, intended to show the savageness of the savage, succeeds mainly in displaying the intense cruelty possible in the white man. Every type of character is strained to the utmost,—Roaring Ralph Stackpole, the everlastingly monotonous horse-thief, whom every one takes to his bosom; Parson Dodge, the Yankee peddler; and Peter, the "Jib," who has Quaker antecedents with a Pawnee outcome. Art is at its lowest ebb, artifice at its highest reach, and Cooper, at last, is outdone in his own province of rank invention.

Meanwhile, in the Green Mountain State, Daniel P. Thompson presented some vivid pictures of the Revolutionary struggle, and, later on, in the "Green Mountain Boys," held the attention well to pioneer methods of fighting the Indians. Of characteristic New England life he gives us a view in "Locke Amsden," drawn evidently from his own experience. This book is stronger in story than Eggleston's "Hoosier Schoolmaster," and truer to the general spirit of the times, though the latter writer sketches better, and has a broader sense of humor. Thompson, however, had an educational motive in this work, and drowned his persons in his theories. Hannah F. Lee also wrote with a moral purpose for the young. It was the excuse for novels all over New England. They must be made, in some way, to supplement the pulpit and school-house, or there was no *raison d'être*.

Kennedy and Simms were of the school of Cooper, yet each had a vein and strength of his own. The former, whose "Quodlibet," "Swallow Barn," and "Rob of the Bowl" are mostly trash, with but little truth or dramatic power or home growth about them, reaches a national value in "Horse-Shoe Robinson." This person, though perhaps a genuine character, drawn in part from life, would probably never have existed but for "The Pathfinder." He is a delightful com-

bination of a good heart, a homely understanding, shrewd fighting qualities, a chivalrous devotion to the duties of friendship, and unprecedented felicity in outriding the Angel of Death, even when the latter is mounted on his fleetest steed; but, withal, he is an admirably characteristic specimen of American serious humor and dialectic extravagance — so much so that, notwithstanding the manifest absurdity of the plot of the book and its otherwise alien elements of character, this single creation lifts the work of Kennedy into national importance.

Simms, with a downward proclivity toward the Newgate Calendar, began, in 1833, to flood the country with every style of fiction. There was no generation of Southern life which he did not touch upon, and no phase of romantic murder which he did not illustrate. With a feeling for reality, which was unknown to Cooper and Kennedy, a certain cleverness of invention and strong sense of subordination which kept him from the obvious artifices of both these writers, he was a superior student of human nature in the peculiar line which he took, and held his characters more rigidly to the sequence of cause and effect. He reaches the depth of cold horror in "Beauchampe," while in "The Partisan" and "Mellichampe" he is at his best as an historical novelist,— making the swamps and swamp-gloom real, and the play of passions of every shade of wickedness and cunning intensely exciting. The women are something like realities, and act an important part in the drama. The romance is made to seem so much like reality, that one is inclined to accept Simms's pictures as justly characterizing the times. They are pictures of action and the external results of passions, rather than studies in the development of character. If they are not pleasing to the fastidious, yet they have undoubtedly tinted the clear stream of history to the unrefined for a long generation.

Beverly Tucker followed in the Simms school, in "The Partisan Ranger," the value of which lies solely in its showing the spirit of certain sections of Southern political thought. Fenno Hoffman's "Greyslaer," published in 1840, was more in the Cooper vein, but intenser, although the dramatic interest, which opens well, fades away early.

Taking thus a hasty survey of the fiction of the first forty years of the century, it is interesting to note how little art there was and what a supply of romantic material,— how fertile invention was among our writers, and how unscrupulous. There was great justice in the twofold attitude of Europe toward it: for abroad the public read with avidity, while scholars criticised with asperity. The new field of pioneer life which we had opened was wide and varied, displaying every form of action, every strong play of passion, every deep contrast of character. It abounded in the mysterious, the extraordinary, the marvelous, as well as in rich and glorious scenery. Pioneers from every people on the globe met — in the somber primeval forests, on the boundless prairies, by slow and magnificent streams, where they came face to face with the most peculiar, the most picturesque — the most mysterious people on the face of the earth, developing by the meeting both the strongest contrasts of character and the most vivid incidents known even to fiction. It was difficult, in the matter of incident, for invention to outrun reality. Europe, as we said, was eager to read and to swallow whatever came; but the scholarship of Europe was even then jealously critical of our use of all this vast material,— and well it might be. Looking back upon it now, in the light of more exacting literary art, we can see the early weaknesses, and must acknowledge the justice, even while we lament the spirit, of the severest things that were said against us. We squandered our riches, until it came to be a question whether we should not have to go into bankruptcy. We gave the world a generous feast, but so ill-cooked that only large appetites could partake with impunity.

It was left to us, however, in literature, as it was in the industries, to show that we not only had the raw material, but could give the world a lesson in the use of it. In Hawthorne, whose faculty was developed among scholars and with the finest additaments of scholarship, we have our first true artist in literary expression, as well as the most completely equipped genius of romance. His subtle insight into the elements of character was marvelous. He was original and purely American,— Puritan, even, in his cast of thought and in all the internal and external conditions of his creation. But art is of no country. All ages temper the steel of the fine workman; all literatures whet the edge of his tools. In his sense of the controlling influence of powers beyond the individual's grasp, Hawthorne was Grecian. "The Scarlet Letter" and "The Blithedale Romance" are as fierce, unrelenting tragedy — controlling not only the actors but the writer — as anything in Æschylus. But Hawthorne's Fate came in the more modern form of "heredity." There were no angry gods; the "Sisters Three" had their origin in the ancestral stock a few generations back. His sense of their power, however, was intense, and was deeply based in the constitution of his own mind. He was too sane a man, of course,

to yield credence to the Puritan suspicion of demonic influences, yet he was too much of a seer not to have discovered that, whether demons exist in nature or not, there are demons which are the projections of our own minds; and the struggle of his art was so to materialize these projections as to give them, not the reality which Cotton Mather insisted upon, but a spiritualized reality equally potent over the actions of men. Mr. Henry James, Jr., has pointed out—very justly, it would seem—a use made of the "scarlet letter" wherein Hawthorne overreached himself,—where the spiritual projection becomes labored and artificial. As far as Hawthorne attempts to make this image a potent force in Arthur Dimmesdale's mind, his instinct is unerring; but when he tries to make it visible to little Pearl and Roger Chillingworth, he passes from art into artifice. There is, perhaps, no natural person in "The Scarlet Letter," just as there is no natural Hamlet in life; but we must accept Arthur Dimmesdale as a marvelous embodiment of the Puritan conscience acting upon the finest human clay,—a clay made sensitive to every emotion, quickened by every intellectual force.

The artistic evolution of the plot is as perfect as that of the "Œdipus Tyrannus." So, too, in "The House of Seven Gables," Judge Pyncheon is equally an embodiment of the granitic forces of the Puritan temperament, inheriting, not its finer conscience, but its untempered rigidity as acted upon by the forces of life. The man breaks at last, but he never bends. In the same way each character in Hawthorne's small list is a finished study, at once local in its surroundings and general in its psychological elements. It is a study of man in his special environment,—more scientific than the science of to-day, because it does what science fails to do; it tries to settle the spiritual element in its true place as a factor in man's life. Others have surpassed Hawthorne in the management of external conduct, of dialogue, of home life, of local scenery; but none have reached the depth to which he penetrated in the study of the human heart as the creature of its own creation. In every higher qualification of the artist, he easily excels. His style is masterly in ease, grace, clearness,—the winning, absorbing, entrancing quality. His skill in hinting in ideal and spiritual elements is the most perfect in our day. His mastery of light and shade—the power of deepening gloom by sunshine and intensifying sunshine by means of darkness—is of the finest order, at once the gift of original perception and the result of most assiduous practice. Probably few writers ever made so many successes that were failures, or so many failures that were successes; that is, few ever did so much that was to others artistically perfect in order that they might do something artistically perfect to themselves. Mr. James marvels at the existence of the "Note-Books"; yet their publication has thrown a flood of light not only upon the workings of Hawthorne's mind but on the sources of his artistic effects. They supplement with a sunny external quality the gloom of his psychology. They show us in his own nature a capacity for beauty and sweetness, where his own generation saw only a capacity for morbid analysis; that is, they furnish the biography of the sympathetic side of his mind, while the novels represent what was equally real to his emotional nature. No doubt, while his actual life was simple and pure-minded, capable of absorbing beauty and interest, he had, in imagination, lived through the tortures of the damned. He had given to Hester and Dimmesdale no exaltation or despair of which he was not himself capable, and probably none which he had not, by sheer force of imagination, without any adequate external cause, passed through. Others have been capable of such moods—the moods of "angels and ministers of grace" as well as of demons—without being either sinners or angels; but few have obtained the power of expressing them as he did. He spiritualized everything he touched, with a quality which is felt but cannot be analyzed,—which eludes every attempt to fix it. Little Pearl, standing in front of Governor Bellingham's mansion, looking at the "bright wonder of a house, began to caper and dance, and imperatively required that the whole breadth of sunshine should be stripped off its front and given her to play with." It was no harder to strip off that sunshine for little Pearl than it is to detach and handle the spiritual quality of these romances.

We had never reached such insight, or such grace of style, before Hawthorne, and we have never reached it since. As a writer he was long in obscurity and had little influence on other authors. Emerging into something like local note when the first series of "Twice-Told Tales" was published, in 1837, he dawned upon a wider field, in 1842, with the addition of the "Second Series." The intensity of his gloom was lightened in the "Mosses from an Old Manse" in 1846, and he then reached a larger circle of readers. In 1850, '51, and '52, he became national in fame, and soon reached the height.

Meanwhile, the old inartistic style of writing was in possession of the field. Of new names we find Cornelius Mathews, who tried, unsuccessfully, in "Behemoth," to re-people the West with the "Mound-Builders," and

later, gave us some fair bits of local coloring in the "Career of Puffer Hopkins" and "Moneypenny"; but, as stories, these were cheap and flashy. We find, also, Charles F. Briggs's "First of the Knickerbockers," which has a flavor—merely a flavor—of old Dutch times and of the spirit of New Amsterdam, but no good dramatic action or story. There was some humor and satire, and some local value also, in his later novels—the "Adventures of Harry Franco," the "Haunted Merchant," etc. Caroline M. Kirkland appeared with her "New Home," "Forest Life," and "Western Clearings," which, with but the slightest thread of narrative, and no dramatic power whatever, were good as realistic pictures of Western settlements.

It was just then that the scholars, poets, and artists entered the field: Motley, with "Morton's Hope"; Ware, with "The Simple Cobbler of Aggawam"; Longfellow, with "Hyperion"; O. A. Brownson, with his religious tract, "Charles Elwood," which had but the faintest apology for the story form; Allston, with "Monaldi." None of these works made any distinct flutter as fiction, or left any impress as pictures of manners and character. D. Carruthers, in the South, and P. Hamilton Myers, who belonged to New York, did a little for local illustration, but no more. Maria J. McIntosh kindled a youthful interest, and got republished abroad. C. W. Webber illustrated South-western life. Herman Melville gave some realistic pictures in "Typee" and "Omoo," and in the sea-tales, in which, however, he fell short of Cooper. Miss Emily Chubbuck (afterward Mrs. Judson) was getting closer home to the girl-life of New England in "Alderbrook." The Warner sisters had begun tickling the emotional fancies of the young to disappoint the experience of the adult generation, coming closer home to the outdoor life of the northern rural districts than to any serious realities. George W. Curtis was dreaming through the East with the "Howadji," and emptying his delicious "Nile Notes" into the lap of Fiction; but the sweet maid was just then looking too fixedly on Hawthorne to discover that she was even addressed. She would, by and by, smile more kindly on "The Potiphar Papers" and on "Trumps."

While the field was thus invaded by many who failed to establish a solid footing, two peculiarly characteristic and most promising men, in opposite schools, and with most opposite spirit and tendency, had come and gone, each leaving a vivid trace, yet each failing of the best,—Sylvester Judd and Edgar A. Poe. Poe's first prose tale appeared in Baltimore in 1833. For ten years he worked that unsunned mine of his, producing shapes grotesque and horrible, in an atmosphere whose murkiness was only surpassed by its miasmatic vapors. The tales are the projections of a weird, fantastic imagination, beaten into form most laboriously, and everywhere showing the stress of the workmanship, but unillumined by any beam of beauty, uninspired with a single spiritual or divine force. Unlike Dante and Hugo, Poe, in his flights of imagination, never went parallel with any movement of the human heart. His stories were exercises of a marvelous ingenuity, and, for the most part, belonged to the domain of nightmares.

In 1845 these tales were all before the world. Hawthorne's second series of "Twice-Told Tales" was read throughout New England. Cooper was still in the field. With three such powerful imaginations, America was well equipped in the field of romance; but she still needed a realistic painter. Cooper grasped the pioneer spirit in its largest range; Hawthorne was most fully possessed of the Puritan spiritual and demonic forces,—each being in himself representative,—while Poe was representative of himself alone, soaring or plunging in a world of his own. But the common external life of New England remained unpictured until Sylvester Judd, who was then thirty-two years old, published "Margaret" in 1845. By gift of nature Judd had a wide range: for he possessed the keen sensibility of Brown and Hawthorne to external impressions and to internal convulsions. He had been visited by all the religious emotions, and was played upon by every Puritan element. He had, moreover, become a cyclopedia of idioms, dialects, and rural technicalities. He possessed the dramatic faculty, and could reproduce as well as Hogarth the tragedy of low life. We have in the camp-meeting, the small-pox visitation, the murder at the dance, and a score of others, scenes as lurid with moral depravity as Hogarth's best. But, unlike that artist, Judd had a delicate purity of mind which made him extremely felicitous in reproducing the simplicity of child-life and moral innocence. Margaret's pathway, amid hideous shapes of depravity in her family associations, is as redolent of innocence as the pathway of Una and her lion. The graceful fancies that play about her in her walk to and from church, her spiritual experiences in the evening on the hills, the sweetness that radiates like moonlight from her pure soul, are singularly child-like. She walks in a tainted atmosphere, but the miasma has failed to strike in. Chilion with his violin, and Obed with his herbs and idiotic obliquity, are originals. The book is

saturated with genuine aboriginal Yankee humor, which depends much less on dialect than on quaint phrases and turns of thought. There is every variety of this, from the raw Yankee of Obed to the semi-educated homespun of Deacon Ramsdell. "Good tew chaw," "orful burnin'," "Luddy mussy!" "Marcy me!" "arrants," "chores," "Goll darn it!" "run of an idee," "sozzled her feet in water," "put some kindlers under the pot," "wouldn't fetch a bungtown copper," "gallows" for "braces," "glairy," "flummery-like," "pimpin' enough," "good as nut-cakes," "jerked up his trowsers," "nuzzles about in the grass," "Oh, dear me, suz!" "larn the brats," "I snore" for "I declare," "lollopping on the steps," "begrutch me," "knee-high to a toad," "clear the coop," "doused into each other," — these are but a few of the phrases which every one acquainted with the rural life of thirty or forty years ago will recognize, not as exceptional, but as a part of the common vocabulary. John Neal's Yankees are caricatures; Paulding's are borrowings; but Judd's are indigenous to the New England soil. They had deep religious natures, and when they were sweet they were racy and rich; when they turned sour they were tart; but there was a basis of natural vigor in both their sin and their suffering for which only the granitic life of New England would account. If upon Judd's keen observation and dramatic power there had been grafted less of the moral reformer, he would have been a great novelist in the modern sense: since he was quite as realistic as any in the modern school, and, moreover, was safe from the novelistic sin of pessimism; for, with a wealth of external fact, he was rich, also, in facts of spiritual significance. But the intense element of moral reform carries him away. He must have his sermon, however much the story suffer. He mounts not only the pulpit, but the platform, and preaches with camp-meeting energy the speedy coming of *his* new millennium. Margaret and Richard Edney are dragged into all conceivable associations — first, that we may be sure of seeing every form of New England life, from "intery, mintery, cutery, corn" down to murder trials and jail-yard executions; and, next, that we may take our share in every reform, from the slavery agitation to the lazar-house visitation. There is in "Margaret" the making of twenty novels — the whole of rural New England in character and scenery, but all undigested. There are scenes of most powerful dramatic energy; but the story, as a whole, is sacrificed to the sermon. The book was welcomed by the best men in New England as of the highest novelistic promise, but it contained all the elements that would ultimately throttle the fulfillment.

The next decade, 1850–60, brought in three strong writers, — all New Englanders, and two of them women. Of writers of lower rank, Richard B. Kimball opened with "St. Leger," John Esten Cooke with "Leatherstocking and Silk," giving, later, "Dr. Vandyke," "Hilt to Hilt," etc., — all abounding in blood and passion. Neither writer had any strength in characterization, and though both were prolific and exciting as story-tellers, they found a wide rather than a discriminating audience. Alice Cary was delightfully discursive in sketches of Western life; J. T. Trowbridge, in the home element of northern New York and of New England; H. A. Wise added another name to the list of the "marines"; N. P. Willis, like most of our traveled scholars, was interested in foreign life, and, among the artists of Italy, gave us almost our first sight of the American girl abroad. Sophia Firkin, in the studio of Paul Fane, determined to have her "bust taken from the life," is rather Bohemian and coarsely drawn; but she is suggestive of our more recent peripatetic heroines. J. G. Holland made his first venture on the field of romance, allured, like Motley, Mrs. Child, and Miss Sedgwick, by early local traditions. The mixed colonial life of interior Massachusetts, with a spice of the witches, bigots, and other sinners, and a yeasty handful of virtue in Mary Holyoke and of justice in William Pynchon, makes the staple of the story, which marks that wide human sympathy and careful balancing of the good and evil moral forces in common life that made Dr. Holland so popular in after years. But as a story this early venture had little value. In "Miss Gilbert's Career," later on, he struck a deeper vein, working out two spirited characters, — Mrs. Ruggles and the energetic, bustling Dr. Theophilus Gilbert. Miss Cummings, in "Mabel Vaughn," "The Lamp-lighter," etc., added something to the delineation of girl-nature and home-life, working that common but fascinating vein in which our women-writers have shown themselves most at home.

Some of these story-tellers were clever, and had a wide audience, but all were greatly over-shadowed by Mrs. Stowe, whose "Uncle Tom's Cabin," in 1852, "Dred" (or "Nina Gordon"), in 1856, and "The Minister's Wooing," in 1859, marked a new era in American novel-writing. Here we had the genuine novel, — no mere romance, or allegory, or evolution from the inner consciousness, but a work saturated with American life, — not local, but spanning the whole arch of the States.

Mrs. Stowe was brought up amidst the

"divinity" of New England, and was as much the product of its clerical faculty as any divinity student. Both her associations and her sympathies sent her to the front of the anti-slavery agitation; while her social advantages and her early migration to the West gave her an opportunity of studying our society in its widest range. Thus she had in her the Puritan in its loftiest reach — the New England clergyman. She was in the forefront of the broadest Puritanic movement — the anti-slavery reform. She developed amid the finest culture, and ripened in mind when the times were ripest for action. These were her opportunities. Her gifts from nature were of the Walter Scott pattern. Her mind was masculine in its perception of humor, in its broad, healthy common sense. She absorbed, like Scott, everything that goes to the fullest expression of human action — incident, gesture, dialect, feature, tone, inflection — both the peculiar and the general. She could generalize and individualize — her individuals being both types and distinct personages — warm, full-blooded, alive all over, and characteristic. She had such a large intellectual endowment that she could give a fair fund of mind to each of her creations; such a wealth of humor and *bonhomie* that she could warm the coldest blood; such a wide possibility of the sinner and saint in her nature that she could endow a double-headed procession to march with Eva heavenward, or with Legree in the other direction. In "Uncle Tom's Cabin" she was lavish. This book contains her whole range of characters, and everything combined to make it her great work. "Dred" is but a sober variation on the anti-slavery theme; "The Minister's Wooing" is but a study in early New England life. "Uncle Tom's Cabin" alone places her with Walter Scott. It is more intense and morally fierce than anything of Scott, and more dramatic. The background, though not so historically full as Scott's backgrounds, is nearly as rich. Except in the negro element, there is no distinctly humorous character in its pages, but a sense of humor irradiates the whole, flashing from black Sam, or Phineas Fletcher, or Topsy, but more from the author's management of incident, and binding every person into the human family. Humor is the sunshine which warms everything into life.

While Mrs. Stowe was still overtopping New England, Mrs. Spofford opened a new mine in ghostly romance. "Sir Rohan's Ghost," "Azarian," and "A Thief in the Night" were somber unrealities. They were projections of the imagination, like Poe's, but with a suffusion of soul and an intensity of feeling to which Poe was a stranger. "A Thief in the Night," in particular, was a work of high art. The awful mystery of that chamber of death into which we are introduced at the opening takes possession of the mind. We stand there over the ghastly corpse, and wait with white faces while the narrator goes back to trace the dark approaches of the grim vengeance to the threshold. We feel as if fixed by the "glittering eye" of the Ancient Mariner. No such weird and somber tale exists in American fiction,—none in which the whole atmosphere is so penetrated with a terrible sense of blood. Poe's tales, in comparison, were aggregations of horror; this was a vital presence. The writer had given her soul to it, and was absorbed out of sight, — a thing which could never happen to Poe.

Another book of the period, showing much originality, but of a sunnier sort, was "The New Priest of Conception Bay." In this the Rev. R. T. S. Lowell did for the comparatively unknown region of Newfoundland what Judd had done for New England; portraying, in the sunniest colors, the simple, rural life of Conception Bay, and making real to the mind those rugged shores, with the barrenness creeping up the sands and rocks, and spreading over the hills and over the life of the people. He did for our north-east coast what Scott, in "The Pirate," had done for the borders of Scotland,—painted the amphibious life of fishermen so that we could hear the sound of the winds in stormy weather, and were permeated with the glow of the brilliant sunshine in summer. All passions there were mild and comparatively innocuous, yet all existed in the egg. Inability to do anything very bad seemed to be an effect of the climate. The very villains were imported, and their villainy faded out. While the story spreads over a large surface, and is often at loose ends, lacking concentration, the concomitants bear every sign of being true to the life and spirit of those shores. The dialects are delicately discriminated. Like Judd, the author had poured the accumulated riches of years into his one book, and it was easy to see that there would be no worthy successor.

This keenness of observation often showed itself in our story-writers of the next ten years. Men of large culture and fine sagacity entered the field merely as foragers, not equipped either with the artistic sense or the high genius of the true novelist, but of shrewd and penetrative critical powers. Much the best of these was Oliver Wendell Holmes, whose "Elsie Venner" and "The Guardian Angel" overflowed with wit and fun and with rare character sketching. One of the best studies in the scholastic life we have ever seen was old Byles Gridley, from whose paternal heart

to his professorial eye was a long stretch, but a straight road. He combined in his person the village patriarch with a whole parietal faculty, and the vigilant patrol which he kept up over the village literature and love shows with what a keen sense Holmes had studied life at the neighboring university. Beecher, in "Norwood," and Higginson, in "Malbone," contributed some character sketches and some of the frame-work of New England life, charming in wit and humor and rich in descriptive passages,— full of local life.

With Miss Louisa Alcott came a spicier child-life, and with Mrs. A. D. T. Whitney a more natural girlhood than had existed before among writers of either sex. We were getting, in fact, from romance to realism; and of this realistic school, following Judd, one of the first and best, though finding but few readers, was Mrs. Elizabeth B. Stoddard, whose "Morgesons" was a work of genius, showing the keenest observation of local customs and of character, and adding to Charlotte Brontë's skillful minuteness a caustic humor which made a new field in novel-writing. The delineation of a kind of life not yet by any means gone from New England, was, indeed, to Mrs. Stoddard, almost too fascinating; and the story is sometimes heavy with a redundancy of spice and plums. The dialogue is crisp, and concentrates action without elucidating it sufficiently. In the paucity of those finger-posts which the more generous novelists set up to indicate the road, the reader must go slowly or lose his way; but with patience comes an abundant reward.

The war period was ushered in with a greater concentration of attention on our native resources in social life.* But the war soon scattered all forces in fiction to center them in action. Pen and tongue and hand, heart and head, were at the battle-front among the tremendous realities. The intellectual life of the nation, like an electric spark, flashed at the point of the bayonet; and with the end of the fight all literary energy seemed spent. There were but few worthy novels written for the eight years following 1861. The old writers were silenced, struck down, like Winthrop, at the front, or, like Hawthorne, by the breath of the cannon-ball as it were. Those who held over this period of strain, surviving in the magazines, lived an attenuated life. The magazines, indeed, almost alone preserved to our fiction the breath of life, and out of them and their monthly demand grew both the new taste and the new supply: for they lived close to the railroad centers, near the great arteries, and felt the pulse of our new, hurrying life. The war had disturbed the old monotony of healthy and regular growth in the nation, forcing old blood into new channels; and out of the change and ferment was to come a more vigorous and much more original novelistic growth. When it was ready, it came in a burst from all parts of the country. The wheels of time had got a fresh jog, and were rolling on a little faster than usual. The magazines had caught the cue, and were demanding rapidity of action. "He who reads must run," they said: "therefore write so that he who runs may read." The rich, old, delightful backgrounds of gossip and scenery began to drop out. Walter Scott and Thackeray seems likely to be left to the old folks. Even Dickens, who gave an impulse to much of the new work, used too large a canvas to suit the new taste. Our writers had begun to travel, and felt the keen artistic sense of European criticism on their style. Unfortunately, also, they felt the sneer which pervades a certain small corner—far from the best corner, as it seems to me—of science, and were fain to suppress the higher idealizing faculty rightfully due to the best imaginations,—"the vision and the faculty divine," which preserves our sanity and has

> "power to make
> Our noisy years seem moments in the being
> Of the eternal silence,"

to give us sight of those

> "truths that wake
> To perish never;
> Which neither listlessness, nor mad endeavor,
> Nor man, nor boy,
> Nor all that is at enmity with joy,
> Can utterly abolish or destroy."

James Herbert Morse.

* This period, with that subsequent to the war, will be considered in a second essay, to appear soon in THE CENTURY.

BOTH SIDES OF THE JURY QUESTION.

[REPLIES TO "IS THE JURY SYSTEM A FAILURE?" AND REJOINDER.]

EDITOR OF THE CENTURY MAGAZINE.

SIR: Undoubtedly there are serious defects in the jury system as at present organized. It may be conceded that it does not give satisfaction in complicated civil cases,—for instance, those involving patent rights. There are also defects not inherent in the nature of the system, such as those arising from the method of selecting the jury, which tend to exclude the most intelligent class. All this goes to show that the system needs reform. Mr. Stickney's paper in the November CENTURY attacks it on grounds that, if proved, demand its abolition. He is in error, it may be noted, regarding the origin of the jury system. It was not in its inception "only a feudal court of the lord's vassals"; it did not have its origin in the feudal system, nor did it form a part thereof. On the contrary, its germ is found in customs common to the whole Teutonic race, and its development was no further connected with feudalism than as it took place during feudal times, and among a feudal people. These statements may be fully verified by reference to Hallam's "Middle Ages" (ch. VIII., pt. 1, note 8), Freeman's "History of the Norman Conquest" (vol. V., p. 302), and Stubbs's "Constitutional History of England" (vol. I., p. 608). As to the cause given for the adoption of the jury system, the "lack of better machinery," it is the true one, so true that it may be given with equal propriety for the establishment of any great institution, human or divine. Further, Mr. Stickney is hardly fortunate in his choice of comparisons, when he couples as twin results of English blundering trial by jury and parliamentary government. Whatever may be the merits of trial by jury, parliamentary government is acknowledged to be, in its results, inferior to none.

Turning from Mr. Stickney's assertions to his arguments, it appears that his main objections to the jury are, that it is composed of men who have no knowledge of the law and no experience in deciding questions of fact. Their ignorance of the law is, as he admits, remedied by the instructions of the judge. But the jury are, he says, incompetent to apply these instructions. This difficulty occurs more frequently in complicated civil cases; but these are comparatively few, and are often settled by arbitration. In all cases, too, the jury may, if in doubt concerning the application of the law, find a special verdict of fact, leaving the decision to the court. Again, the jury are not commonly left to apply, unaided, a bald statement of legal principles to such facts as they may find, but, in civil cases at least, they are frequently directed that upon the finding of such-and-such facts, they are to return such a verdict,—a practice well calculated to remove any difficulty in the application of legal principles. As for criminal law, it is so simple that its application causes comparatively little difficulty.

Mr. Stickney argues further, that the jury is not well qualified to decide questions of fact, for lack of training. On the contrary, every man's daily life is a training in the decision of questions of fact. Every business man must again and again, in the course of his business, sift evidence, weigh testimony, and balance probabilities. Knowledge of the world and knowledge of human nature are almost synonymous, and both are acquired in ordinary social and business relations. This is the knowledge and this the training needed in the jury-box. The judge, on the other hand, is by his position removed from the current of popular life. His acquaintance with business methods and the life and sentiment of the people is, as far as his profession is concerned, almost entirely theoretical. Instead of being fitted by his professional training for the determination of questions of fact, he is in a measure unfitted. His business is to determine questions of law, and law is a science, the principles of which are ascertained and illustrated in a vast number of reported cases, and its conclusions reached by logical deduction from those principles. All is definite and exact. Questions of fact, on the contrary, require for their determination a nice estimation of probabilities, in which formal logic goes for little, and the very foundation of reasoning is loose and uncertain. A contract is indeed a contract, whether concerning flour or railway bonds; but the law governing that contract, and the facts to which that law is to be applied, are very different things, determined by very different methods, and requiring diverse abilities for their determination.

Mr. Stickney concludes his case against

the jury with an argument, which he very correctly introduces as "the most singular point of all." Reduced to a simpler statement it is this: Errors occur in the rulings of the judge, for the elimination of which appeals and new trials are used; but these cause great delay and expense, to remove which evils the jury should be abolished. Thus it seems that the jury which decides on fact is to be abolished because the judge errs in deciding the law,—an application of the doctrine of vicarious atonement both new and striking.

Mr. Stickney has little to say of any merits belonging to the jury system, and nothing of the process of double selection, by which the worst elements of the community may be kept out of the jury-box; nothing of special juries, by which a superior class of jurors may be obtained when desired; nothing of the advantages of the check which judge and jury mutually exercise upon each other, though he must have known that the judge may prevent any gross injustice by setting aside a verdict. Such criticism is neither candid nor convincing. He very properly denies that the jury is longer needed as a security for popular rights against the encroachments of government. However, as a security against the encroachments of wealthy and unscrupulous corporations, the jury is still valuable. It is true that jurymen are human, and may sometimes be corrupted; but their brief term of service limits the power to do mischief, while a corrupt court, clothed with jury powers, would be a perennial source of injustice and oppression.

H. E. S.

Bay City, Mich., Nov. 11, 1882.

Editor of The Century Magazine.

Sir: To a lawyer, the article in the November Century, assuming that the jury system is a failure, and coolly proposing a bench of judges in its place, is startling and suggestive. That justice is not always speedy is not the fault of juries. It is largely the fault of lazy and incompetent judges, whose blunders force litigants to appellate courts. The number of cases appealed because the verdict is contrary to the evidence is extremely small. In comparison, the number appealed because of errors in law, chargeable to the presiding judge, is extremely large. Judges are trained men, and yet appellate courts disagree as to the law. The disputes that weary litigants are disputes about the law of the case, not the facts of the case.

Mr. Stickney says: "The fact is, that the jury, in our criminal procedure, and, in truth, nearly our whole criminal procedure, is especially adapted for the protection of criminals." This is too sweeping. The aim of criminal law is to punish guilt, but its humanity is too broad to sacrifice innocence by "running amuck" after crime. The law declares that no citizen shall be deprived of his sacred rights of life or liberty unless twelve of his countrymen, after seeing and hearing the witnesses, state, under oath, that in their opinion there is no reasonable doubt of his guilt. Does Mr. Stickney wish that rule amended? Does he wish to hang men on surmise and imprison on suspicion, because a felon now and then goes free? "To innovate," says Edmund Burke, "is not to reform." Our penitentiaries are moderately filled with the work of juries. The ratio of acquittals to convictions is wonderfully small, as any prosecuting attorney will admit. And many of these are lost by the absence of witnesses, the weakness of the proof or the prosecution, and some are justly lost. A bench of judges would never do for criminal cases. They would become hardened. As Hamlet says of the grave-digger who sang at his work, "Truly, the hand of little employment hath the daintier sense." And oftentimes the humanity of the jury has offset the callousness of the judge, and tempered justice with mercy. I have never known juries to err except on the side of mercy. I have known courts to oppress.

The jury system is an educator of the people; and this idea did not "first spring up in the fertile brain of Alexis de Tocqueville." Erskine remarked it. It educates them more in their sentiments than in their acquisition of mere legal and political knowledge. "English subjects judge each other," says Erskine with pride. The jury system is democratic; the bench of judges monarchical. One diffuses power among the people; the other centralizes it. The jury chosen from the people, representing directly the people, identified with the people, answerable to the people, is more alert to the rights of the people than a bench of judges whose very position makes them independent of public opinion, and who are less immediately responsible to the people. Those who believe in the maximum of power in the people and the minimum in the government will never consent, without a struggle, to a jury of judges. A stream is not purer than its source, and the value of the jury system depends upon the moral character of the citizen. The sole cause of the unfavorable view of the system arises from the alacrity with which complacent judges excuse the wealthy, influential, and prominent citizen from serving his country when called upon

the jury. There is just where the reform is needed, and there alone.

Andrew Lipscomb.

WASHINGTON, D. C., Nov. 7, 1882.

EDITOR OF THE CENTURY MAGAZINE.

SIR: I have read, with careful attention, the paper on the abolition of the jury system in the November CENTURY; and, while it has left an impression, it does not satisfy me. It is a subject which has been quietly simmering in a multitude of minds for a long time, and, I believe, needs only to be brought prominently before the people to provoke the liveliest discussion. Mr. Stickney desires to substitute trial by a commission of judges, which shall be conclusive in the first instance, save in the one event of disagreement of the judges in rendering judgment; in which case a new trial, or re-trial, would be had. But where would this trial be had? In the same jurisdiction? Before the same judges? The answer is, before a smaller number of these same judges. That means, I suppose, that if, in the cause of A *vs.* B, four of the judges were for A and three for B, the second trial would be had before either the four A or the three B judges only (presumably the four who were for the plaintiff), in either of which cases the event of the trial is certain beforehand, supposing the evidence to be the same in the second trial. And if it is not the same, then the new trial could not (perhaps I ought to say should not) be had for disagreement of the judges, but for evidence admitted or refused contrary to law, or afterward discovered; and thus, at the outset, we have an important exception to the rule of practice. There could be no other division of the judges in which there would exist the smallest possibility of agreement. Unless there were a material change in the testimony at the second trial, the judges who had solemnly weighed the evidence and carefully applied all the then existing principles of law bearing thereon, and then deliberately put themselves on record as in favor of the demand of one party, would be chary, indeed, of changing a conviction so clearly settled. The opinion of a judge would come to be worth but little, and precedents would be valueless if he could hold two opinions upon the same state of facts. Why should not the first opinion be entitled to as much weight as the second? To me it seems entirely improbable that any system will be adopted which does not include a provision for appeals to a higher jurisdiction. While the article in question expressly admits that under no system can all decrees be just, it yet expressly stipulates that no appeal can be had to correct these occasional errors. Can a system for the administration of justice be sure, and as perfect as circumstances will allow, while no preparation is made for the correction of certain error?

The fact that suitors would in all cases know what judges were to try their causes is, to my mind, a formidable objection to the plan proposed. Every man has his relatives, friends, and partisans. Every man has his biases in religion, morals, and politics. Every man has his weaknesses. Every man has his prejudices against persons, places, things, and methods, and so *ad infinitum*. Can it be supposed that some of these things will not sometimes, however infinitesimally, operate for or against him who sues for pure justice? Would a judge construe the evidence against a near relative as he would against a stranger? How many of his personal or political friends, how many of his faith would come before him for trial? Would he lend a willing ear to the offerer of bribes? Would he be impressed with the social grandeur of one man or the social abasement of another? If he were suspected of any of these things, how would you find it out? Put him upon his *voir dire?*

Very truly yours,

J. L. Long.

PHILADELPHIA, Nov. 2, 1882.

EDITOR OF THE CENTURY MAGAZINE.

SIR: Mr. Stickney seems to have overlooked many things far from unimportant in his sweeping abolition of the jury system. He says that "a contract is a contract, whether it concerns flour or railway bonds"; but does he mean to say that a jury composed of men accustomed to dealings in flour or bonds, as the case may be, cannot better decide as to whether a breach of a contract relating to either of those articles has occurred, than a court of judges, who could hardly be expected to be familiar with the details of every business followed by their fellow-citizens? Surely his argument on that point fails in all cases where a special jury is obtainable, if not in others. He suggests that "the judge, by a few years' experience on the bench, gets a knowledge of the general methods of business men which no business man can possibly have." Is that true? If it is, our judges should all go into business, and, *vice versâ*, our business men into law, since there is to be had an education superior to any they can find in the counting-house or the board of trade. Here I must take issue squarely with Mr. Stickney. The judge may acquire a general knowledge of business forms and usages, in fact usually does, but from whom does he learn it? Why, he learns

it from the very men Mr. Stickney declares unqualified to sit on juries.

As far as knowledge of human nature is concerned, I have seen men in the jury-box as shrewd as any judge that ever sat on the bench; plain farmers in homespun garb, with as keen eyes for the "animus" of a witness, and as good judgment as to his credibility as is to be hoped for in anybody. Besides, the juryman's attention is solely directed to the witness's statements and manner, and is not distracted by having to pass on the admissibility of evidence and similar questions,—an advantage of no small account.

The exclusion of irrelevant matter, I suppose, arose not so much from a fear or distrust of the jury, as from a desire to save time. Would Mr. Stickney have counsel drag the history of the neighborhood before the jury, however trustworthy, or would his court of judges be disposed to listen to all that might be offered? Here, again, I think he totally overlooks reasons more potent than those he demolishes.

How often, comparatively, does it happen that the judge's charge contains good ground for appeal? And does Mr. Stickney suppose that one opinion out of a hundred would be changed if the judges took twice the time to prepare them? I do not, for the reason that as the judge has to pass upon many points over and over again, he necessarily becomes familiar with the greater number of questions daily submitted to him, and can decide them "instanter" to the best of his ability and learning.

The real usefulness of courts of appeal consists in the aid they afford to the trial judges, and were the former to have cognizance of the facts as well as the law, much valuable time would be wasted, and the appellate court prevented from establishing the law on all points presented to it, thus enabling the courts of original jurisdiction to decide causes rapidly and correctly. As to the number of appeals, would not disappointed suitors appeal every time they suspected a hostile prejudice in the mind of the presiding judge, if they knew the facts would be passed upon again, and would not Mr. Stickney's proposed system be peculiarly liable to this objection?

With regard to expense, I do not see how his plan would diminish that at all. And how about the state of unsettled legal rights which would probably exist during the time the change was being made? The history of the jury system is not at issue: the question is, does it fill the purpose for which it is used? By keeping the courts as free from corruption as possible, I think our system of judicature will be as near perfection as the spirit and genius of our people will allow.

Respectfully yours,

Edwin F. Bishop.

HOUGHTON, MICH., Nov. 11, 1882.

MR. STICKNEY'S REJOINDER.

IN the space allowed me I can only make a summary of what seem to me the chief considerations in the question before us. I could, I think, establish my historical accuracy where it has been questioned by your correspondents. For instance, as to my statement that the jury system which we in this country now use (and that is the jury system that I considered) was originally a feudal court of the lord's vassals: When I take your correspondent's express admission that its development "took place in feudal times, and among a feudal people," and add to that admission the facts that the very essence of a jury was that it should be made up of the parties' "peers," and that the "peers" were the vassals of the same feudal lord, I think we come somewhat near to establishing the point that *our* jury *was*, at first, "a feudal court of the lord's vassals." If we were to seek the "origin" of the "jury," we should have to go much farther back than the Teutonic races,—among whom your correspondent intimates that the "jury" had its first existence.

But such points do not touch the merits of the discussion. The real question before us is whether we cannot frame some piece of judicial machinery which will better serve our needs than this mixed tribunal of judge and jury.

What the American people ought to have, in the way of judicial machinery, is a system of courts, where the poorest and weakest man could summon the richest and strongest man or moneyed interest, and be sure of getting justice,—not at the end of six or seven years, and at great cost, but at once, and at slight cost. Nothing less than that will serve our needs. With the majority of our citizens, a long delay in getting justice is almost as bad as not getting it at all. The delays of the law are now the chief evils in the administration of justice. Those delays now amount to almost a denial of justice to any but the rich and strong. Our judicial machinery must make justice not only sure, but cheap and speedy.

In order to secure this general result of sure, cheap, and speedy justice, and to secure it for all men, poor and rich alike, the machinery for the administration of justice must be as perfect as it is practicable to make it. Especially the tribunal which first hears the

cause should be made as perfect as may be, the first hearing should be as thorough as possible, and the first hearing should, as a rule, be the last. In other words, the work of hearing and deciding a cause, like most other human work, should be done as well as it can be done at the outset,—once for all,—instead of having the first doing of the work almost certainly imperfect, and afterward spending several years in the correction of old errors and the making of new ones.

Does not that general proposition have in it, at first blush, a shadowy glimmering of sound sense?

I ventured to suggest as to our present jury system these considerations:

1. That it is made up of several men is a valuable feature. This tends to secure a consideration of all sides of a case.

2. The requirement of unanimity in reaching a verdict is a valuable feature. It tends to insure the thorough consideration of every essential point in a case, and almost never works any practical inconvenience.

3. The use of men who are without special fitness and experience for the special work they are to do necessarily brings the same practical results in the administration of justice that it does elsewhere. This work of sifting evidence, of seizing and holding the vital points in a case, of giving due weight to the contradictory statements of the parties and the arguments of able counsel, is a work that requires strong minds and thorough training.

4. The use, in any tribunal, of men who are only temporarily taken from their ordinary callings, and who must therefore make their decision in all cases without delay, makes impossible the thorough consideration of the evidence in complicated cases, and makes it almost certain that there will be errors in the judge's rulings, which he is compelled to make on first impressions, without a full opportunity for deliberation.

5. This certainty, or great probability, of errors compels us to allow appeals in (practically) every case, through sometimes two or three appellate courts.

6. These delays, of appeals and new trials, constitute the greatest evil in our present system of procedure.

I then ventured to suggest that we should keep the good points of the jury system (for there are good points) and attempt to eliminate the bad ones. I suggested the following main features of a judicial system:

1. Our tribunal for the original trial of causes should be made up of a reasonable number of men (as is the case in the jury),—say, five or seven.

2. These men should be men of training and experience.

3. They should at the outset decide the whole of the case on the facts and the law.

4. They should take for the consideration of each case such time as should be needed, be it more or less.

5. Unanimity should be required in giving a judgment, as is now the practice with the jury's verdict.

6. Appeals (except in very special cases) should be abolished.

The chief objection made to this proposed scheme, by the most intelligent men, is that it is not practical.

The scheme has been tested by experience. It is in substance the system that has now been in operation in the United States Court of Claims for over twenty-eight years. As to its practical working there, I am allowed to print extracts from letters from the Honorable William A. Richardson, Judge of the Court of Claims, whose large experience on the bench and in public affairs will command for his judgment the greatest weight. Judge Richardson, who has been a judge of the Court of Claims now for more than eight years, was, before being Secretary of the Treasury, for more than sixteen years a judge of probate in Massachusetts. He writes (I have ventured to italicize some phrases):

"I have had considerable experience in the line of your suggestions. The Court of Claims, of which I have been a judge for more than eight years, very nearly meets your ideas of the wants of the people as a remedy for the evils of the jury system. It has been in existence now twenty-eight years, and works with entire satisfaction, apparently, to all suitors, *with little expense and little delay*. * * *"

"As to the point raised by those who object to your plan for judicial investigation of facts by trained judges, instead of by untrained and often uneducated juries, —the anticipated danger that judges trained in the law *would not be so able to agree upon facts* as jurymen,—I may say:

"This point has been subjected to a crucial test, by our Court of Claims, under laws and regulations which require the utmost exactness in the determination of facts, and do not admit of a general verdict or judgment on the whole case without a statement of the facts agreed upon.

"By a rule of the Supreme Court, made in 1865, the Court is required to make, in each case, a finding of the facts in the case established by the evidence, in the nature of a special verdict, but not the evidence establishing them.

"There are five judges of the Court, and the Act of Congress of June 23, 1874, ch. 468, provides that 'the concurrence of three judges shall be necessary to the decision of any case.' This is understood to apply to the facts, each and all of them, and to the law, as well as to the final result. Therefore, in reducing to writing the exact and minute facts which are material to the issues involved in the opinion of any one of the five judges, the test of agreement is tried upon many points in every case before the final judgment can be considered at all. Experience has proved that there is no difficulty whatever in the five judges bringing

their minds to an agreement *on every single point of fact* raised by either of them in conference, or by the counsel at bar. The statute requiring the concurrence of three judges has had no practical operation, as to the findings of fact. *There has rarely been a case in which, at the end of the judges' conference, there has been a single dissenting voice to the findings, in whole or in part, and no case where the findings were adopted by three against two of the judges.*

"Judges are much more likely to disagree upon the law or the application of legal principles to the facts than upon the facts themselves. Superficially considered, this might seem strange, but the reason for it becomes manifest upon a careful investigation. The several judges come from different States, where they have been educated and trained each in the peculiar practice of his State. Their views upon legal principles have, of course, been molded to a greater or less degree upon the decisions of their respective State courts; and those decisions have, from time to time, modified the ancient principles of the common law to adapt them to State legislation, and the conditions, habits, and customs of the people of the local sovereignty. In other words, the judges, having been educated in somewhat different, though not antagonistic schools, very naturally at times take different views at first of legal principles, or the application of legal principles to the facts. But that *even these differences melt away in conference* may be inferred from the official printed reports, the latest two volumes of which disclose only two dissents, one in each volume. At the present term *there has not been a single case of disagreement as to the law or fact.*

"As to the facts, the evidence of them is presented to all the judges alike. Each one has exactly the same means of ascertaining them as do his associates. Their previous training as to principles of law does not color the evidence differently in the eyes of the several judges, and no one of them has preconceived ideas on the case, because the whole case is unknown to them until presented in open court. In memory, closeness of observation, and powers of analysis, judges may differ; but as they are all *men of trained minds, accustomed to weigh evidence, and take into consideration the views and opinions of others,* as well as to express clearly and forcibly their own, any differences which exist at the beginning of a conference are almost invariably reconciled before its close. If one has forgotten any part of the evidence, another remembers it, and calls attention to it. If one does not at first see the bearing of any part of the proof upon other points or upon the issues, some other one is sure to point out its force and effect. In this way, by intelligent discussion, comparison, and examination, extending through all the time that may be required for that purpose, and not stifled by a general verdict hastily agreed upon, an agreement is almost invariably reached; and no one can reasonably doubt that the real facts are established just as they are proved.

"Juries are practically compelled to return a verdict within a limited time, usually within a few hours. But the judges can deliberate as long as the complication of the facts and the necessities of the case may require."

The main principles underlying the scheme which I propose are these:

1. The decision of causes needs to be in the hands of selected able men.

2. Training is as necessary for the men who administer justice as it is for men engaged in any other service.

3. Whatever work is to be done at all should (as a rule) be done as well as it can be done in the beginning, once for all, and not done rudely and incompletely at the outset, with the possibility of afterward correcting errors by a series of new trials and appeals.

There are many other practical considerations in favor of the scheme which can be fully appreciated only by lawyers. I may mention this one: that a scheme having the main features here proposed would furnish a simple and easy method of fusing the common law and equity jurisdictions, which is very generally regarded in the profession as desirable.

Albert Stickney.

NEW YORK, April 20, 1883.

DISSOLVING VIEWS.

WHEN I have been long gone, if one I love,
And who loves me, shall chance upon a ring
That I have worn, or any simple thing,—
A knot of ribbon, or a faded glove,—
I wonder if the sight of it will move
To fond remembrance, and if tears will spring,
And if the sudden memory will bring
A sudden sadness over field and grove.

Perhaps: and yet how quickly we forget!
And how new scenes, new faces that we meet,
Crowd out the old,—until the world grows gay
Above forgotten graves. Softest regret
Grows stale by keeping; and, however sweet,
No Past has quite the sweetness of To-Day.

Caroline A. Mason.

TOPICS OF THE TIME.

The Present Aspect of the Irish Question.

AS TRAVELER, lawyer, university professor, historian, and member of Parliament, Mr. James Bryce writes on the Irish question (in the present number of THE CENTURY) with a training, experience, and authority that are not associated with every utterance on this momentous and perplexing question. As a study of the historical, political, social, racial and temperamental phases of the subject, Mr. Bryce's essay seems to us remarkable. He writes, apparently, totally without prejudice; he criticises both sides impartially and without remorse; and he presents his views with a lucidity that makes certain things clear which to many minds, especially those at a distance, have long remained dark.*

Writing, as he does in this case, largely for a foreign audience, Mr. Bryce has not seen fit to discuss pending remedies, or to give his personal opinion as to what precise course England should take at the present moment. The thoughtful reader of his essay is, however, able to make his own deductions as to the wisest policy the dominant party can now pursue.

Although the Irish question is in a less acute phase now than it was a year ago, Ireland is still the main difficulty of English politicians, and English opinion seems, unfortunately, more than ever divided as to the measures needed to pacify the sister island. The discovery of the Phœnix Park murderers and the conspiracy whose behests they carried out; the signs which such an event as the attempt to destroy the Government offices in London gives, that the desperate party is still active, have driven many, even of those who sympathize with Irish demands, into the belief that for the present nothing can be done, and that the British Parliament must wait till Ireland is more "quiet and contented" before a system of popular local government is created in Ireland, or any other concessions are made to Irish demands.

But to us who watch the struggle calmly from the other side of the Atlantic, such a view seems mistaken. It is a mistake not to follow up the remedial measures already taken, by other measures which will complete their work. It is a mistake not to use the present lull in popular agitation for the purpose of carrying out reforms which could not be so well discussed in the midst of clamor. Above all, it is a mistake to allow the dynamite and dagger conspirators to feel that they have gained their object of preventing reforms, and further embittering the minds of both nations. Nothing pleases these ruffians better than that English statesmen and the English people should identify the Irish people with themselves, and make their outrages a reason for pausing in the path of conciliation.

To us, therefore, it seems that the ministry of Mr. Gladstone ought to persevere in the policy which it announced three years ago, and in which the Land Act of 1881 was so great a step. It may, and indeed it ought, at the same time to repress conspiracy and outrage with the firmest hand. It can do so all the more confidently if the rest of its conduct, and its willingness to listen to reasonable proposals, show that it is not the victim of panic. These murders and explosions must be the work of a not very large band of fanatics. But the fact that they have not excited more reprobation in Ireland, and have been promoted by certain Irishmen in America, and applauded by others, shows better than anything else the depth of hatred which is felt toward the English Government in Ireland. If England has done so little to lessen this hatred by her well-meant efforts during the last fifty years or more, might she not try the experiment of leaving the Irish more to themselves, and letting them learn, by a little disagreeable experience, how hard a thing governing is, and how great are the evils of disorder? Perhaps, if the patriots of Ireland had more responsibility thrown on them, they might learn a little more wisdom and moderation.

One word more may be said as to the attitude of the English: and it is a word of praise for the self-control which they have shown under provocations which in most countries of Europe would have produced an outbreak of fury against the people from whom come assassins and the organizers of explosions. We remember how the insurgents of the Commune were dealt with after the capture of Paris in 1871; how Russia has dealt with Poland; how Austria dealt, in 1849, with the Hungarians who had met her in open war. An American may feel some pride in seeing that, whether English policy toward Ireland is wise or not, the English nation does not forget either its courage or its humanity even when most sorely tempted.

The Outlook for Statesmen in America.

THERE are evidences, in recent events, which point to a reversal of the ratio that has heretofore existed, in American politics, between the man of native but uneducated force on the one hand, and the scholarly and experienced publicist on the other. Hitherto the former has been much in demand; and both for his intrinsic merits and as a counterbalance to an over-refined culture, his importance could not be gainsaid. The conditions of American life before the war, when our frontier began almost at the doors of the Capitol, produced a large proportion of such men. War always lays emphasis on natural vigor and skill, and the hasty character of our struggle made prominent for the time in military life, and the momentum of the struggle afterward carried into political life, many whose equipment for legislative duties was an energetic, self-reliant, and martial disposition, rather than a contemplative habit of mind, or a culti-

* The essay on Lord Beaconsfield and that on Mr. Gladstone, in THE CENTURY for November, 1882, and March, 1882, respectively, were also written by Mr. Bryce. Mr. Bryce is widely known in America as the author of that standard historical work, "The Holy Roman Empire."

vated experience. Once in a while the instincts of the self-made man (as distinguished from the college-made man) are fine enough to lead to broad views, but in general his horizon is narrow and bordered by prejudices; he speaks well of the bridge that has carried him over, but of no other. Such a man is apt to regard legislation as the science of applied selfishness, and to legislate for but one type (himself) or for his other self — the party. But, even if we consider legislation on a merely selfish plane, the fact remains that laws must be made for a wide diversity of selfishnesses, and this requires not so much ideas as the capacity for dealing with ideas. The more successful the self-educated man has been,—whether in railroads, or silver mining, or sheep-raising,—the more likely he is to be incapacitated for the broad work of the legislator. Indeed, to do his constituents justice, he is usually chosen, not for his knowledge of tariff principles or of constitutional distinctions, but in outright advocacy of some interest for which he is certain to stand up and be counted, on every occasion. This was well enough in war times, when there was one overmastering interest. But with the inauguration of President Garfield the war spirit expended the last of its momentum, and the country once more recovered the civic temper and turned to economic questions pure and simple. The result is inevitable that the current of progress will sweep past this type of public man and leave him in a shallow bayou of his own. He will have his uses, but his days of leadership are numbered.

On the other hand, it must be owned that the national legislative service is not yet being recruited largely from the scholarly classes. The House of Representatives has been steadily losing intellectual caste ever since the war, until now there is little left to lose; as to the present Senate, it is probably not the peer of any one of its predecessors, even in sound presidential timber, to say nothing of economic learning, or that liberalizing culture which is particularly needed in a democracy as a check to the abundant philistinism of the merely practical man. Fancy the Congress of the United States, forty years ago, either desiring or being compelled to go outside the Capitol for material for a Tariff Commission! Are we to have no great successors to our great men—none with the imagination of Seward or Webster, or the altruism of Sumner? Is the future greatness of America, as Whitman maintains, to consist only in the greatness of the average? Looking down from the gallery of the House, a foreigner, with a literal idea of representative government, might naturally draw conclusions the most unfavorable to our intellectual and moral character as a nation. Few foreigners know how remote from the tides of every-day activity is at the present time an annual session of Congress; nor do they know that, though for the time government here may seem to be robbed of its representative character, still, even under present conditions, the people are as sure to be heard on a commanding issue (though a little tardily) as in England or France. When it comes to a direct vote on any one question which concerns a large class of voters, the ordinary politician is anxious to be on the popular side. His skill is frequently expended in trying to prevent a question from becoming a commanding issue. His opportunity is in maneuver, in tact, in compromise, in dodging a direct vote. He does not want to make a bad record, or to antagonize anybody, and when he steals, it is by schemes that rob merely the Government or some friendless interest. He knows that, being under our saturnine exteriors a happy people, and being hardly aware of a governing power, we not only grow indifferent to wrongs that do not come home to us, but are slow in arousing to those that do. From this state of affairs we take refuge in a blind belief in our luck,—a sentiment which is to us what national prestige is to other nations,—and feed ourselves with the hope that something is going to pull us out of the slough besides our own virtue and wisdom. But it is evident that this indifference cannot last. It is the result of conditions that are rapidly disappearing; and once they are gone, the normal interest of Americans in political affairs will assert itself like trodden grass.

The causes which have produced the marked reluctance to enter public life on the part of those who naturally should control it, are in part the subject of an able paper in a recent number of the "Fortnightly Review," by Mr. James Bryce, one of the keenest observers and fairest minds in England. Though writing for an English audience, Mr. Bryce has not been misled by false analogies between England and America — between politics which are concentrated in a single body and are the social life of England, extending even into its educational institutions, and the politics which, as we have indicated, are little more than an incident in the material conquest of America. "The chief practical use of history," he says, "is to prevent one from being taken in by historical analogies"; and, as a part of his argument, he makes clear to the London critic of the novel "Democracy" exactly how much weight is attached to the negro-minstrel view of American politics, which it seems that critic has been taking seriously as the fate that threatens English constitutional government from this side the Atlantic. Without underrating our legislative evils or the difficulty of eradicating them, Mr. Bryce does justice to the best feature in the present aspect,—the increased public sensitiveness to purity in candidates for office. We have nowhere seen remark of the fact that in New York State the exciting campaign of last fall was conducted almost without personal vituperation of the candidates,—a fact which argues well for the increased willingness of able and honest men to accept office. Mr. Bryce's paper, though written before the election, is not, however, impaired by that event; and the reader who thinks the Civil Service Reform bill either an unnecessary, or a final, measure, may well go back and consider the evils which have been its occasion, as they are outlined by an unprejudiced historical student.

There are many reasons for believing that our politics have touched bottom in their moral and intellectual decline. Assuming that the Reform bill shall be fully executed and its scope extended (which are now the issues), and that this shall be followed, as logic demands, by State and municipal legislation of a similar spirit and scope—the trade of the gambling politician will lose its prop and substance. Moreover, together with the return of a larger proportion of the best men to public life, there will be before long a

new generation upon the scene,—a generation born since the war, young men educated in a commercial era, and with new blood that runs unclotted by the great conflict. Sectional questions will no longer afford the uneducated demagogue a political advantage, as such, over the scholar, the lawyer, or the merchant. For the first time in half a century, the stigma has been removed from the honorable pursuit of politics. As our social conditions continue to approximate those of England, the lingering prejudice against college-bred men will disappear, and that element will occupy the prominence in legislation which it enjoys in other phases of our national life.

One naturally asks, What is being done to feed the sources of future influence in the new profession which will virtually be established when the people resume their sovereignty? Already our best institutions of learning are shaping their instruction to meet the demand of the times. Harvard, Yale, and Johns Hopkins now afford excellent facilities for a thorough education in political science and for the discussion of current public problems; while, at Columbia, the subject occupies a special department, with prize lectureships for the best original work. Besides the teachings of the best attainable text-books, much is accomplished by the personal influence of the instructors, who in some instances have awakened the pupils to enthusiastic interest in the subject. It is through such personal agencies, if at all, that a higher tone is to be reached in our public life. What could not be expected of a professorship of politics with such a man in the chair, for instance, as Dr. Lieber, or Charles Sumner, or President Woolsey, or Mr. George William Curtis?

It is easy to scoff at the absurdity of educating men for a profession so dependent upon the suffrages of their neighbors; but are not lawyers and physicians thus dependent? And is not the spoils system merely an interference with the law of supply and demand? And when the superiority of the educated statesman were once evident, would he not be employed as readily and as long as the lawyer or the physician? For one result of the vital teaching of political principles will be the preparation of educated men, if not to lead, at least to select the leaders.

Stripped of its old bombast, the truth still remains that the political interest of the world is centered in America, and awaits the realization of our destiny. We cannot too soon or too laboriously set to work to create an atmosphere about the minds of young men which will nourish a high ideal of political duty, and make a political career as honorable here as in England. Emerson, in "The Fortune of the Republic," —that noble last word of warning and encouragement to his countrymen,—exclaims, with a prescience of patriotic faith: "I not only see a career at home for more genius than we have, but for more than there is in the world."

Over-organized School Systems.

THERE has been in New York, during the past winter, a very unusual interest in the public schools of the city. This interest has been due largely to a series of articles in the "Mail and Express" newspaper, in which the workings of the system were exhibited more thoroughly and systematically than they ever before have been in the daily press. Commenting upon these articles, the editor of the "Popular Science Monthly," in a recent number of that magazine, struck a lusty blow at machine education. In deference to public opinion on the subject, the Board of Education, at the beginning of the new year, undertook, in the words of one of its members, to "ease up the machine" by modifying the course of study, and making a few changes in the direction of elasticity. These changes have not been long enough in operation to enable one to judge fairly of their effects. Our purpose here is to indicate the main features of the machine as it has existed in New York for some years past, and to point from them a moral for schools of other cities. It will be necessary, then, to restrict our view to those particular features of the system which bear upon the end in view.

The distinguishing peculiarity of the New York system is the superintendency. That, more than anything else, makes it the machine it is. The course of study prescribes what subjects, and what portions of each subject, shall be taught in each grade. It is the duty of the assistant superintendents to find out whether the exact ground laid down for each class has been covered by it, and how well the work has been done. In order to this, they visit each school at least once every year, and examine every class. The results of the examinations, recorded on a scale of percentages, are reported to the superintendent, and from these reports he estimates the character of the instruction. In this way, by having the same men examine all the schools, and by comparing one school and one class with another, a wonderful uniformity is secured, both in methods and in results. Every school is made just as much like every other school as possible. Children of the same grade in different schools are taught the same parts of the same subjects in the same way at the same time.

Even this, however, is not enough. In order to secure the completest uniformity, another step is necessary. If the liberty were given him, each teacher might use his own method of reaching the result supposed to be aimed at — the education of the pupil. Such diversity is effectually prevented by a provision which makes the teacher's standing dependent upon the percentage obtained by his class in examination. If the class obtains a certain per cent., the teacher is marked "excellent"; for a somewhat smaller per cent., he is marked "good"; and for a still smaller, "fair" or "bad." If two "fairs" or any worse mark stand against a teacher's name in the superintendent's book, he is a marked man, in more senses than one. The teacher's standing being thus entirely dependent upon the percentage obtained by his class in the yearly examination, the strongest incentive is provided for him to teach, not in the way that seems to him best for the class, but in the way that will enable his class to meet the questions of the examiners. It follows that he does not desire liberty in regard to his methods of teaching. He wants to know exactly how much of each subject will be required by the examiner, and just how that official wishes the subject taught. Theoretically the teacher is required by the examiners to develop in his class the ability to think and to reason; practically, he is driven to obtain "good marks" by

drilling them upon such questions as he has reason to expect will be asked at examination.

Just at present the New York system is in a transition state, in which the principals temporarily have far more liberty to use their own methods than they have had for twenty years past. The "Manual," a teacher's hand-book, in which are laid down minute directions in regard to methods, is in process of revision. This manual has proved an excellent servant, but a bad master. Originally written as a book of suggestions in regard to methods, it was made mandatory by the Board of Education, against the protest even of its authors. What effect the revised manual, used according to its original suggestive purpose, will have upon the system it is impossible to predict; but as this system has been working for many years, as it is still working to a large extent, through the momentum gathered in these years, and as it is in danger of working again after the revision of the manual, a more complete and effective method of stifling individuality in teacher and pupil could not be devised. As a machine, the system is perfect; but the end of this machine is its own perfection, and not the development of the faculties of the children. Under such conditions as these, education becomes a mere drill; stuffing is encouraged, or rather demanded; the relation between teacher and pupil is made, so far as possible, entirely mechanical; and the training is robbed of that ethical element, that relation to character and conduct, which should be its most important constituent.

A certain degree of organization in schools is absolutely necessary. An ungraded school is chaotic. The evils of disorganization have been clearly perceived; and the steps of grading the single school, of securing uniformity in different schools of the same grade, and of appointing a superintendent, a part of whose duty it is to see that the schools do preserve a certain degree of uniformity, have already been taken in most of our cities. The tendency seems to be toward the New York type, and the danger is that in shunning the evils of a lack of system, system is likely to be sought for its own sake. If this be granted —that schools in our American cities are tending toward over-organization,—it becomes a problem of very great importance how to secure a reasonable degree of system without crippling the teacher in his efforts toward the free expansion of the pupil's mind. Some machinery, doubtless, we must have; but the end of education is the development of character, and character cannot be machine-made by any process whatever.

In the solution of this problem, superintendents of schools must bear the most important part. A thorough knowledge of the principles of education, and a wise adaptation of those principles, will enable superintendents to develop their schools in the right direction. Their supervision should be intelligent and sympathetic; they should be the helpers, and not merely the judges, of their teachers; they should explain why certain methods are founded on right principles, and why certain others are not; they should occasionally take hold of a class and develop a subject in the teacher's presence, in order to show how underlying principles may be practically applied. A large part of these duties might be performed by principals, who ought to be men fitted for such work. The distribution of supervisory functions is a mere matter of detail. The teachers' standing should not depend entirely upon periodical examinations of their classes in the New York style. Courses of lectures by eminent educators should be provided for teachers, and they should have the means of making a continual advance in the science and art of their profession.

In ways like these the problem we have indicated may be solved, and the dangers of over-organization, so strikingly exemplified by the school system of New York, may be avoided.

Two Rich Men.

Two men have lately passed away from life among us whom we should have been glad to make immortal. William E. Dodge and Peter Cooper were conspicuous examples of men of wealth using their wealth in promoting the wealth of others. They, in their own manner of living, solved the problem of capital and labor. If all rich men followed their system, and found riches to be only a means of doing good, all envy, jealousy, and hatred of the rich would fade from the hearts of the poor, and society would be freed from one of its most vexatious annoyances and most threatening dangers. But where one rich man appreciates the true use of wealth, a hundred regard it only as an instrument for luxurious indulgence and vulgar display, or for miserly and meaningless hoarding. It is this false use of wealth that loosens all the joints of society and makes our future uncertain. The reason why the two men whom we have named were fountains of blessing, is to be found not in demagogism, by which a Tweed gives coal to the poor as a means to secure votes, but in a benevolence which seeks the welfare of others as its end. Dodge and Cooper sought no office nor worldly honors. They were too noble to be receivers. They lived on the higher plane of giving. They understood the Master's words: "It is more blessed to give than to receive." They had an exquisite delight (such as the miser or spendthrift never knew) in an economy of benevolence, and made it the business of their lives to minister to the wants of men. What to the mass of men would be self-denial was to them the healthy outflow of a generous spirit. To have these streams dried up is a calamity not only to those who were immediately benefited, but to the whole city, which loses the force of these living examples of virtue.

The great, greedy crowd of money-getters were rebuked and bewildered when they saw the venerable man of fourscore and ten still planning how best to help the deserving poor. The weak creatures who make up fashionable society could not but get a glimpse of an idea that there were higher prizes than dog-carts and yachts, and all the paraphernalia of social distinction.

Peter Cooper was the antipodal energy to that of certain other rich men in our community, dead and living. The one energy came from heaven, the other came from a very different place. The one infuses health into the community; the other poisons everything it touches. The one energy is modest and loving; the other is brass-browed as Satan, and stirs up the fires of hell in the human breast.

To the youth of our city and country the two benevolent lives to which we have referred have been

a useful lesson. How many of these may have been brought over to the practice of virtue by these honored names! How many young men, ready to start in the selfish life of the multitude, may have been checked by the discovery in these examples of a truer happiness to be pursued by a holier road!

The best sermon that can be preached on the subject of riches and their use is to point to these noble lives. They are facts and not theories. They cannot be doubted or denied. They lived among us and left the truth established concretely for the examination and admiration of all. They have made more glowing and striking the contrast between the pure joys of beneficence and the feverish excitements, jealousies, trickeries, dishonesties, and cruelties of the grasp for gain. Many theoretic nostrums are recommended for diseased society, but lives like those of Dodge and Cooper give health wherever their influence extends.

OPEN LETTERS.

On the Dynamite Policy — by an Irish-American.

THE Irish land question, and the past and present condition of the Irish peasantry, have assumed during the last two or three years more general interest outside of Great Britain than at any previous period of time. This has been brought about, in my opinion, by the persistent efforts of Mr. Charles S. Parnell and his colleagues in the British Parliament, in organizing the Land League and keeping the subject of the wrongs of Ireland before Parliament, in and out of time. Mr. Parnell has, no doubt, believed that this was the best and only effective means of obtaining redress for his long-suffering countrymen. That there has been in the past, and there is now, wide-spread distress and unnecessary suffering inflicted on the Irish peasantry and farmers with small holdings, in the South and West of Ireland, there is no question. That these poor people, overworked, badly fed, and scantily clothed, have suffered wrongs inhuman in character, and which no other people would bear with such patience and Christian fortitude, is a fact clear to those who have visited Ireland to study the condition of the people with unbiased feelings, and gifted with the power of close observation.

I have traveled through Ireland five times during the last ten years, and I know from personal observation that these people have flagrant wrongs heaped upon them, and the bulk of them work harder, with less encouragement, and have less left when the year's rent is paid, than any similar class in Europe. Every available article raised on their small holdings is saved and sold to meet the rent when due. I have witnessed dozens of ejectments under circumstances that seemed heartless and cruel and sufficient to make one's blood run cold.

These noticeable wrongs and consequent suffering of the peasantry and small tenants, forcibly ejected from their homes by unsympathetic landlords, naturally engender bitter and hostile feelings which break out occasionally in acts of violence toward the agents, for the owners of the land seldom appear among the tenants. These acts are usually magnified and exaggerated by the English press, and it only gives one side of the story. It has always seemed strange to me, in discussing these questions with intelligent Englishmen, who are fair and generous on other subjects, that they do not understand the Irish question, or from prejudice they misrepresent the true condition of the Irish situation.

These long-continued grievances and hardships of the small tenants are traceable, in my opinion, to a class known as non-resident landlords, who have their rents collected and their business transacted through efficient agents, a body of men as heartless as their masters. These Irish landlords spend the bulk of their income, and all of their time, in England and on the continent. They seem to be without national pride or human instincts so far as their tenants are concerned. They take no steps and spend no money to help elevate or improve the wretched condition of the small farmers in the South and West of Ireland. There are no people who are more grateful and responsive to just and fair treatment than the Irish peasants, but they have but few chances to exhibit these feelings in the districts of Ireland named. Every Irish-American, worthy of the name, is deeply interested in the best way to bring about reform and build up a better and healthier state of feeling between landlord and tenant in a peaceful and equitable manner.

But just here I desire to say, in the most emphatic language, that every respectable Irish-American whom I know, condemns the acts of the low-lived scoundrels who take any part, directly or indirectly, in such attempts as have been recently made to destroy life and property by the hellish method of dynamite, or crimes like the Phœnix Park murders. Such low and dastardly acts bring the cause into disrepute, and those who commit them are not and cannot be true friends of Ireland. These crimes alienate the friendship and sympathy of the enlightened Christians of all nationalities,—a sympathy which is sure to be extended toward any brave people who are suffering from unjust laws.

P. T. Quinn.

Nathaniel Hawthorne Again.

THERE are two or three points in connection with the fragmentary story left by Nathaniel Hawthorne, and published recently under the name of "Doctor Grimshawe's Secret," which seem to me to have been but imperfectly considered by the critics. The story, with its accompanying "studies," calls our attention to the methods of a great artist as well as of a great

genius. That has often been said. We can see the artist sporting with the gaunt, solid frame-work of his images as if they were toy structures. In the early days we were taught to believe that gloom mastered the man, but by the help of these "studies," we see that it was he who called forth the gloom and remanded it to its place again, — circumscribing, shaping it, summoning the sunshine to touch it into delicate fantastic forms, molding it as perfectly as the creative mind ever molds its creature. He is as much the conjurer as Prospero, who summoned the "spirits of the vasty deep," or as Shakspere, who summoned Prospero.

It is clear enough to the ordinary reader that the early chapters of the story, while more than tentative, are far less than final. The author has got the order of attendance regulated. The story has taken shape not only to the reader's mind, but clearly has a shaping nearly satisfactory to the author, although far from being illuminated, intensified, enriched, as Hawthorne always enriched his perfect work, with poetical fancies and spiritual suggestion. There is here and there a grain of coarseness, not yet refined; of crudeness, not yet polished; some inelegance of diction which would have tried his very soul to see in print. In this respect — in its finish and polish — the work in the first seven chapters is behind the "American Note-Books," which bear the marks of being written in leisure moments when the writer could pause to pursue a fancy or elaborate a description. In these chapters, he is either fitting together previous studies, as he means the parts to stand — bending the beams, so to speak, to make them take their final shape and place, or, in some spurt of the imagination, fashioning with great rapidity some connecting structure, in too much haste and glow to be nice in the elaboration. The stress of the workmanship is visible; but its greatness and solidity are worthy of the study of our modern school of novelists.

The persons are greatly typical — Elsie, with the mysteries of womanhood; Ned, with the spirit of a nobleman working in the atmosphere of democracy; the grim Doctor, with the implacable passions of a granitic nature, gradually, though never entirely, yielding to the gentle rain of human sympathies, — even the musty corners of his cobwebby study breaking into that golden glow which cobwebs may take on when lifted into the sunshine; Colcord, with that wholly spiritual but impotent nature which Hawthorne had previously painted in Clifford; Lord Braithwaite, with the Italian subtlety and instinctive diabolism of a descendant of the Borgias. These are all great types, and clearly marked. It is easy to see that if the author had carried out his purpose, the uncertainties of touch would have disappeared, the moral significance of the characters would have been intensified, the mystery would have taken truer relations to realities, the passions would have become not more typical of the profounder passions of society, but more in harmony with the beautiful spiritual forces. As it stands now, imperfect in a hundred ways, but pretty fully blocked out, there is nothing inferior in the conception to that of the "Scarlet Letter."

Each part of the picture has its own local atmosphere. In New England, the bleakness of winter, the somberness of innumerable grave-yards, the stillness of a wilderness, the gloom of Calvinistic theology; in England, the sensuous steam of the roasting-spit and the clatter of old silver, rising amid the antique glories of old ruins. Parts of the English picture are finished; other parts are hardly even plotted, while in the American portion the story is evidently completely plotted, but scarcely a thing polished. Elsie's share in the story is only hinted. It is clearly not intended to be great, but rather sunny, and effective as sunshine. She is no heroine, but she is reserved to be the delight of the reader's eye, for his heart to rest upon in the midst of the darker hues of the story; while Ned is to be no hero, but, like Hamlet, the sport of Destiny. Both Ned and Elsie are exquisitely conceived, but they are to be the puppets of great and unrevealed powers. As Hamlet's love yields, and Ophelia goes down, when ambition and revenge enter, so here, when the implacable spirit of age-long jealousy and inherited hate are to be considered, love is a minor affair, flinging its gleam upon the canvas, but no more. It is enough for the author's purposes if it be there in the morning to brighten the hill-tops, and in the evening to lend its tints to the western clouds.

But the point which interests me most, and which, I think, has been less clearly brought out by the critics, is one that touches close upon the methods of our present novelists, who, like Hawthorne, like Irving and Cooper, and John Neal and Bancroft and Motley, go abroad for a larger intellectual atmosphere, but, unlike those writers, strike a malarial tract of it, and come home to us with a cold chill upon them. With Hawthorne, this certainly was not the case. We find everywhere in these studies, as we find in Irving, the broader horizon which foreign travel gives. The shy, deep-eyed New Englander was peculiarly fitted by nature to find poetical inspiration in the Old World. He loved its past long before he had seen it, and found in its traditions the mysterious working of forces which had reached over to America. He loved the old somber atmosphere as only an American can. How well he could create its counterfeit is seen in the Puritan novels. Better than any of the English romancers, better even than Scott, it seems to me, he could feel the poetical charm and spiritual influence of an old, ivy-crowned castle, or of a "venerable brotherhood" of English elms. But he preserved, in the glaring light of an English dining-hall, the essential sanity of mind that accompanied his stage-coach rides among the New England hills. His was a mind brooding over the mystery of life, searching, in human faces and human speech, as well as among the ruins of man's work, for the key to his graver action. The movements of his persons are everywhere under control. He is the wizard, weaving the mystery, but keeping the key to it, and never involving himself in his own meshes. The mystery was one of superstitions, — an atmosphere for which he was not responsible, but which he must work into his web, with all its dreamy additions, as a thing found in existence. His was not the business of science to dispel illusions, but to show them. His pictures were always such as required this setting. Note, in the Italian novel, how he prepared the background, taking in the art and culture, the subtlety and passion of the Italy of the Middle Ages.

His stage is to present the scenery, not alone of kings and dead antiquities, but the artistic aspirations embodied in antique ruins, the faded passions represented in crypts and moldy dungeons. He was picturing a world in ruins, a world dead hundreds of years ago, but in and out of which life is still creeping, affected still by the dead past. The life of to-day is small compared with its background. Man, as an individual, is infinitesimal; but the shadow of mankind, as it lingers from the past and broods over to-day, is vast and awful. This is the motive of the New England romances, particularly of the "House of the Seven Gables," and the motive grew stronger when the author was planning this last work. He was most certainly trying his hand at that international novel of which we hear so much. His studies ran in that direction, and his mind was at work powerfully in the effort to disentangle modern England from monumental England, to get the life of to-day square against the magnificent débris of old castles and old inherited glories, and to contrast with this the working idea of the American system, which he, both from his patriotic and his manly instinct, considered the loftier ideal.

The results of this study are seen in the long and penetrating analysis of the old warden's character and that of his *confrères*. Looked at as a delineation, though far from complete, of national characteristics, the work is deeper and loftier to my thinking than those works of to-day which claim to portray national traits,— because it goes below the surface. Hawthorne was an artist, and loved the beauty of the Old World; but he had the Puritan manhood, and his struggle to show the finer meaning of it is almost painful.

James Herbert Morse.

On Mr. Cable's Readings.

MR. GEORGE W. CABLE has been giving some readings from his own books in Hartford, one in public, and two in private parlors. An ordinary "reading" is one of the entertainments that reconcile us to the brevity of life and beget a longing to go to the land where there will be no more sighing and no more reading. But Mr. Cable is not an elocutionist, and has none of the smart bravery of the professional which we admire, and praise, and shun. He is just an interpreter of his own writings, and by a method so simple and so without pretence that it seems to lack all art — until we attempt to account for the effect produced. This effect was not so satisfactory before a large and miscellaneous audience as in presence of a small, compact, and more sympathetic one, partly because the selections were not so judiciously made for the public performance, and partly because of the limitations in the writer himself and in his material.

Mr. Cable's work is delicate and subtle, and his interpretations of it must be the same. The love scene between Aurora and Honoré Grandissime is a fascinating model for all apprentices in the art of fiction, full of tenderness, witchery, and the utmost archness and finesse of a woman about to capitulate. To broaden and exaggerate this refined and delicate scene so as to satisfy the spectators and listeners in the back seats of a large hall, to substitute for the bashful, half-broken utterances of love the loud tones of the eloquent elocutionist, is to lose a certain charm of the proceeding. If you have ever tried to make love through an ear-trumpet, you will understand what I mean. The public reading of this was delightful, but it lacked the subtle shading which the author gave it in private.

That which thoroughly captivated his hearers in the private readings was "Posson Jone'," the last sketch in "Old Creole Days." In originality of creation, in exquisite moral distinctions, in distinct dramatic force, this seems to be the most important addition that American literature has received in many years. It has refinement, breadth, and humor; it gives us two new types; it is as complete as a miniature portrait, and yet it is so freely and largely placed upon the canvas that we feel no limitations. The author has not given us a study of two men only, but a wide picture of human life.

Mr. Cable is a master of the Creole dialect, and in his mouth the broken English of Jules St. Ange, delicious in its elisions and accent, interpreted to us perfectly the character of the insouciant, conscienceless, kind-hearted, volatile Creole. The writer does not describe him nor analyze him; he simply places Jules before us with a dramatic skill that is very rare. And the reader brings him out from the page in all his airy substantiality and elusive, non-moral gayety.

"What a man thing right *is right;* 'tis all 'abit. A man muz nod go again' his conscien'. My faith, do you thing I would go again' my conscien'?"

It is not the drinking of coffee, but the buying it on the Sabbath that troubles the parson.

"Ah! *c'est* very true. For you it would be a sin, *mais* for me it is only 'abit. Rilligion is a very strange; I know a man one time, he thing it was wrong to go to cock-fight Sunday evening."

"Ah!" continued St. Ange, as they descended the stairs, "I thing every man muz have the rilligion he like' the bez — me, I like the *Cattolique* rilligion the bez — for me it is the bez. Every man will sure go to heaven if he like his rilligion the bez."

"Jools," said the West-Floridian, laying his great hand tenderly upon the Creole's shoulder, "do you think you have any shore hopes of heaven?"

"Yass!" replied St. Ange, "I am sure-sure. I thing everybody will go to heaven. I thing you will go, *et* I thing Miguel will go, *et* Joe — everybody, I thing,— *mais*, hof course, not if they not have been christen'. Even I thing some niggers will go."

While the author was unfolding to his audience a life and society unfamiliar to them and entrancing them with pictures the reality of which none doubted and the spell of which none cared to escape, it occurred to me that here was the solution of all the pother we have recently got into about the realistic and the ideal schools in fiction. In "Posson Jone'," an awkward, camp-meeting, country preacher is the victim of a vulgar confidence game; the scenes are the street, a drinking place, a gambling saloon, a bull-ring, and a calaboose; there is not a "respectable" character in it. Where shall we look for a more faithful picture of low life? Where shall we find another so vividly set forth in all its sordid details? And yet see how art steps in, with the wand of genius, to make literature! Over the whole the author has cast

an ideal light; over a picture that, in the hands of a bungling realist, would have been coarse and repellant he has thrown the idealizing grace that makes it one of the most charming sketches in the world. Here is nature, as nature only ought to be in literature, elevated but never departed from. For me it is a good deal truer than a police report, and it adds something to life that I would not part with.

This is not the place for a discussion of Mr. Cable's genius. I only took up my pen to say that those who are so fortunate as to have an opportunity to hear this author interpret his own fascinating creations have a great pleasure ready for them.

Charles Dudley Warner.

Barnay as "Mark Antony."

HERR BARNAY'S vocation was unmistakably preordained when he was endowed by Nature with his musical, resonant, flexible voice, his graceful and impressive presence, his noble head with its Roman cast of feature and commanding poise. Add to these physical gifts, the quick, electric fire, the happy blending of Oriental fervor with western versatility and vivacity characteristic of his Hungarian temperament, and we have the natural actor, who, no less than the poet, is born, not made. Possessing these splendid inherent qualifications, Herr Barnay has strengthened and developed them by the careful training, the earnest and laborious study of a conscientious artist. He is master of all the devices of the stage, using a freedom and variety of dramatic resource that occasionally (though only occasionally) verge upon the melodramatic. His art belongs to the romantic, realistic school, as opposed to the classic and antique. I use, advisedly, the apparently contradictory terms "romantic" and "realistic," for the great romantic revival initiated in literature by Rousseau and his followers, and developed by Goethe, Byron, Scott, and all the poets of the eighteenth century, was but the protest of truth, nature, and realism, against cant in morals and the artificial in art. By the singular effect of a violent reaction, romanticism to-day in its turn has come to signify the very antithesis of truth and reality. But this interpretation is only a passing accident resulting from the extreme point to which the movement was carried, and does not alter the fact that the best art may be at the same time very romantic and very real. Herr Barnay is seen to most advantage in characters that call into play these two qualities; while he lacks the serene repose, the majesty, the restrained power of the finest classic art, he is peculiarly fitted for the rendering of brilliant, fiery, and impetuous *rôles*. As *Mark Antony*, his masterly interpretation of the spirit of the part was not a little enhanced by his appropriate type of face and figure, which made the illusion complete. Never before was more adequate expression given to the triumvir's personal attributes, — his grace, elegance, and magnetism, his moral weakness and intellectual strength, his genuine but superficial sympathy, his unscrupulous ambition, his insinuating, nay, irresistible oratory. Herr Barnay is wonderfully fine and subtle in the scene immediately following the assassination; the studied self-control of his manner, the deeply calculated effect of his conciliatory words to the conspirators, and the apparent sincerity with which he clasps the hand of each in turn, are worthy of all praise. But beyond praise is his sudden, overwhelming outburst of passionate grief, when the murderers have departed and he flings himself upon Cæsar's corpse.

> "O pardon me, thou piece of bleeding earth,
> That I am meek and gentle with these butchers."

This is one of those "great moments" of spontaneity and power that are the touchstone of quality, and that set the stamp upon the actor of genius as distinguished from the actor of talent.

Barnay's delivery of the funeral oration leaves nothing to be desired. The Roman mob (evidently drilled according to the rules of the Meiningen company, to which Barnay at one time belonged) bring his speech into admirable relief, swayed and controlled, as they seem to be, by his commanding voice and cunning rhetoric. Leaning forward on his arms over the pulpit he addresses them at first in a colloquial tone, only gradually working up to the eloquent, declamatory style of the orator, and visibly studying the effect of every inflection upon these coarse, expressive faces. He is extremely forcible and original in the concluding passage of the speech:

> "But were I Brutus,
> And Brutus Antony, there were an Antony
> Would ruffle up your spirits, and put a tongue
> In every wound of Cæsar, that should move
> The stones of Rome to rise and mutiny."

Here he leaves the hearse, beside which he has been standing, and winds in and out among the mob, hissing forth these lines with half suppressed horror and indignation, directly inciting, as it were, each individual to the terrible act of "mutiny!"

Within the limits of his temperament, which, as we have said, is marked by energy, enthusiasm, and impetuosity, Barnay is an actor of the first rank. His repertory is extensive and varied; but if it were only for his *Mark Antony*, he would deserve to be classed with the very few actors who seem not so much to interpret as to reveal Shakspere.

Emma Lazarus.

On Indian Education and Self-support.

THE antagonism felt toward the Indian seems to result, not so much from conflicts incident to our possessing the land, as from his sociologic status which differs so widely from our own. It is a comparatively recent suggestion that a social condition similar to that of the Indian preceded our present advancement, and that an intelligent study of archaic forms of society may reveal the sources of some of the laws and customs which are still potent in our midst. This suggestion, however, has not yet affected the bulk of our people, and the indiscriminate name of "savage" is still sufficient, practically, to cut the Indian off from human interest and sympathy.

Indian society is generally supposed to be without law or order — a sort of random life; but careful investigation is showing that most, if not all, of the tribes are organized into gentes, the gens being based

upon relationship; these gentes combine to form *fratres*, the fratres join to form the tribe, and tribes unite to form confederacies. The gens is, so to speak, the social unit. It possesses a distinctive name, significant of its religious or social ancestry; it has a system of names which are given to its members; it has its hereditary chief, elective chiefs, and soldiers; its location in the tribal circle is fixed; and it has its functions and duties in the religious and secular tribal ceremonies. It is, therefore, a little community possessed of distinct powers, but lacking the means of perpetuation because of the law which forbids a member of a gens to marry within his gens. Thus the tie of marriage and collateral relationship binds the gentes together. Each Indian, therefore, is born into his gens where he is thenceforth fixed, for he may not set up his tent and establish his home except with his gens, where his immediate interests and responsibilities center. The influence of the gens holds even when the Indians have broken up the tribal circle and scattered out on individual farms; and many generations will pass before all traces of this ancient social form will cease to exist.

War among the Indians is generally a private enterprise. When a man desires to avenge a wrong, or wishes to wander forth in quest of booty, or, if in the recklessness of sorrow, he desires to risk his life to assuage his grief, he steps out into the tribal circle or open space, and announces his intention to go on the war-path. Then, when he has fulfilled certain ceremonies, he departs, and is followed by those of his kindred or friends who care to join in the venture. Each one goes voluntarily,—no one is urged or forced to be of the party. War, therefore, rarely involves any considerable part of the tribe, and there is no record of a war ever being the unanimous wish of the tribe. Warfare, partaking of this private aud irresponsible character, is more disastrous than when organized and national, since it renders life and possessions exposed to individual caprice. This custom, so detrimental to the advancement of a people, is, in part, counteracted by the authority vested in the chief.

It is the duty of the chief to prevent quarrels, to settle those that take place, to preserve harmony in the tribe, and to make peace with other tribes. His office is semi-religious, and he cannot go on the war-path, or lead his people in battle, unless under the stress of defensive warfare. Our failure to understand the private character of war-parties and the peaceful duties of the chiefs has led to mistakes. Negotiations have been entered into between the Government and Indian soldiers, and not with the chiefs of the tribe, who were quiet at home. The tribe, not being officially represented, either in the war or in the settlement, regarded the whole transaction as a private arrangement, which could not concern it as a whole. "Paper chiefs," as the Indians often call those Indian soldiers whom our army has sometimes caught and negotiated with, possess much less influence in the tribe than we are wont to fancy. Indians are never counted as chiefs unless they are initiated into the office by the regular tribal form.

Indian society has, therefore, its peculiar organization, and is both real and effective. The same is true of the religion of the Indian. It, too, binds him fast with minute observances, intricate ceremonials, long rituals, on the exact performance of which the welfare of his daily life and his future depends. The Indian's religious duties begin in his childhood and last throughout all his days. Fixity, not freedom, is the characteristic of the primitive forms of his society.

Incapacity and aversion to labor are supposed to be characteristic of the Indian, and are spoken of in connection with his being a hunter, and, in the popular notion, to be a hunter is to live for sport and the pleasures of the chase. When the food supply is derived alone from the precarious chase, the occupation of the hunter becomes one of grave responsibility and labor. Among many of the tribes, the hunting was under the control of leaders, who were appointed to the office with certain religious ceremonies, and any person undertaking private hunting-ventures without the knowledge and sanction of these leaders would incur serious punishment. These rules were rigidly observed in the buffalo country.

Thus the life of an Indian man after reaching maturity was filled with activities and dangers, and it was impossible to avoid such a life in a land devoid of animals capable of being domesticated. Sex determined the occupation of the individual. The men composed the combatant force; they were the protectors and hunters. The women formed the non-combatant part of the community, and were the agricultural and industrial portion of the people. Many of the peculiarities of the Indian race and custom are traceable to the absence of domestic animals. Our more fortunate race, being bred on a continent where lived the sheep and the ox, laid upon these animals the burden of food supply, and the mind, thus freed from its most pressing need, asserted its creative power and devised better modes of living, and gradually society developed into coördinated forms and industries. It is a suggestive speculation to consider what would have been our present condition had our immediate ancestors been forced to accept the poverty of this country in respect to animals, cereals, and fruits. When we look at the Indian mode of life, it is important to remember his environment on this continent and its potent limitations.

It is worth noticing that the Indians have not invented a lock and key, as it opens a singular vista concerning their estimate of possessions. When about to leave their villages, they place their goods in cache to prevent loss from their enemies. Thieving among them is rare; the chiefs enforce the return of articles stolen. It would almost drop the race from the list of mankind to assert that Indians never stole; but it may truly be stated that stealing is not a characteristic trait. The contrary prejudice on our part is queerly indicated in the following quotation from an official communication: "They (the Indians spoken of) are honest, or at least as honest as it is usual for Indians to be. I have never known them to steal, and their word can usually be relied upon."

Treachery toward a friend is almost unknown among Indians. Toward an enemy it is as it is with us: "All is fair in war." To the outside observer vengeance often seems indiscriminately practiced by the Indians; but according to their laws of the responsibility of kinship, the acts find explanation. Among the Indians, kindred rise and fall together; any or all can be held responsible for the act of any one of kin

whether all are cognizant of the act or not. According to our law, innocent and ignorant persons may thus be made to suffer; but according to Indian law, kinship must bear the burden. It is not many centuries since a similar code held us in its clutch.

When fairly dealt with, the Indians are, as a rule, friendly, honest, and true. Truthfulness is an Indian trait, the ideal man is "straight." "I have talked to you without branches," said a venerable chief. The Indian idea of truth is simple, literal, hugging close to the fact, and this idea is consonant with his elaborate social and religious ceremonies. "It is," or "It is not," covers all the ground to the Indian, and he finds it difficult to comprehend the contingencies which hedge about our life and thought.

A careful study of the Indian reveals him to be a man bearing the marks of a common human nature. His peculiar environment has developed him in lines which do not coincide with our lines of development. If his ancient environment were to continue unaltered, there would be little hope of any speedy or great modification of his ancient social and religious forms; but his environment has already changed, and he is to-day stranded upon unknown and untried circumstances. For this change we are directly responsible, as well as for the difficulties involved and their solution. We have corralled the Indian and tried by various expedients to postpone facing the problem of his future, until at last further delay is impossible. His future is indissolubly linked to our own, and the welfare of both races demands careful consideration of the question before us and the difficulties involved in it.

According to the last report of the Indian Commissioner, there are in the territory of the United States, exclusive of Alaska, 262,366 Indians. Of this number 64,393 belong to the Five Civilized Tribes in the Indian Territory and the Six Nations of New York State, leaving 197,973 Indians whose treaties and relations place them in direct line with our responsibility. The amount of land held in reservations is 224,259 square miles, covering an area of 143,525,960 acres. Deducting the amount belonging to the civilized tribes before mentioned, which is 19,672,147 acres, of which only 9,500,352 are classed as tillable, there remains 123,853,813 acres, contained in about 124 reservations, not including the Pueblo villages. These reservations are under the management of fifty-six agencies, and are scattered over eleven States and nine territories. There are, besides, 15,434 Indians living at large without Governmental supervision or special land provision, and this number does not include the remnants of tribes living in the Eastern States.

The wide extent of country over which these tracts of land are spread, the variety of products, and the character of the soil, should prevent too sweeping generalizations when one is considering how the Indians are to become self-supporting on these lands.

Heretofore, the question of Indian land tenure has overshadowed all other considerations pertaining to his welfare. Important as is this question, the statistics contained in the commissioner's report show it to be less simple than has been supposed. Of the 123,853,813 acres contained in the 124 reservations and set apart for the support of the 197,973 Indians, only 8,096,463 acres are reported as tillable, which would give not quite five acres to each Indian. This calculation, however, is based upon an even distribution of the tillable land, according to the location of the population, but the report shows that the tillable land is very unevenly distributed. Another obstacle, perhaps, is the Indian's view of land tenure. He does not see how land, which is as necessary to the welfare of animated nature as air and water, can be withdrawn from the common weal and appropriated to the use of an individual.

The question, therefore, of the Indian becoming self-supporting is something more than giving the Indians titles, and telling them "to go to work on their lands," even if every Indian were adapted to farming.

Agriculture, where the land is suitable, will undoubtedly be the employment of a large number of Indians; but it is clearly impossible for all, since there does not remain enough tillable land to yield support from the soil alone. The inexperienced labor of the Indian adds to the difficulty, and this arises from his isolation and consequent lack of training by means of observation and contact with farmers. It may not be inopportune to allude here to the fact that heretofore tilling the land has been considered by the Indians as woman's work, and the Indian man possesses the aversion, common in our own race, of one sex entering upon the conventional occupation of the opposite sex. Nor is civilization as viewed by the Indian woman without its drawbacks. Their status is one of independence in many ways, particularly as to property. Once when our laws respecting married women were being explained to them, an Indian matron exclaimed, "I'm glad I'm not a white woman!"

A considerable portion of the land classed as tillable requires irrigation, and to make such land profitable, capital and intelligent labor are needed to construct ditches, canals, flumes, etc., and to keep them in repair. A considerable portion of the land reserved is suitable for herding, and there are many persons in our midst who advocate this occupation for the Indians as especially suitable, and quote the advance of our race in the remote past, through herding. The environment of our race was very different from the conditions of this continent, where the absence of animals capable of domestication has left the Indian without an heredity which would tend to make him successful in the care of animals. Herding is to-day, not a pastoral occupation, but a business requiring capital, executive ability, and a knowledge of the market. None of these requirements are at present possible to the Indian, particularly with his barrier of language and ignorance of commercial methods.

Looking at the Indian tribes from a close personal knowledge and study of their life and customs, it seems plainly indicated that variety of occupation and modes of winning self-support is to be the rule with them, as it is with us. Nor can one expect that every Indian will become an industrious, enterprising landholder. There will be such among the tribes, but there will also be the shiftless, indolent class that exists in every community. Our method of treating the race has been to level down, and to attempt to make all alike. The results have been unfortunate. It is the salvation of a people to permit those who can to advance and distance the less vigorous.

The industrial schools at Carlisle, Pennsylvania, Hampton, Virginia, and Forest Grove, Oregon, are movements toward recognizing the value of the individual Indian. At these schools he is taught trades, the worth of labor, and personal responsibility, and, thus is prepared to cope with the world and earn his own living. The Indian has always been a kind of artisan, and his hand is skilled by long heredity to steady lines and strokes, more fine than heavy. The trend of his past turns him toward the shop where the work of the eye and hand is coördinated. To the truth of this statement, it is only needful to call to mind the silver work of Northern and Southern Indians, the bows and arrows and other weapons, the wrought bone implements, the pipes, both historic and prehistoric; nor should woman's handicraft be forgotten,—her weaving, quill embroidery, the articles made of skin, bark, and wood; her pottery-making and free-hand ornamentation. Our museums bear ample testimony to the industrial ability of our native races. The Indian, therefore, is not lazy; but he does not labor as we labor; he has not learned the value of persistent work, which begets provision and care for the future, and his environment in the past has been of such a character as to furnish no suggestion as to the need of such care-taking, but rather the contrary. The one thing imperatively needed for the Indian is industrial education. Educate him thus, and he becomes a friendly neighbor and coworker; keep him in ignorance and isolation, and he becomes dangerous to his own future and to those about him.

The Commission's report states that the number of Indian children who are of school age (exclusive of the five civilized tribes) is 34,662; and this is an underestimate, as several tribes are not reported. The number of reservation schools is given as 73 boarding, 105 day, and 2 night schools. These schools are maintained at a cost to the Government of $278,733, exclusive of rations and of part of the clothing. Various religious societies contribute $58,725, and the State of New York $17,644. The industrial schools at Carlisle, Pennsylvania, Forest Grove, Oregon, and the Indian department at Hampton, Virginia, receive from the Government $91,394, and religious societies give to these institutions $49,882. It is not improper to state that, but for generous outside support, the effectiveness of these schools would be seriously curtailed. Those now in operation can accommodate only 10,202 children, leaving a school population of 24,460 without any possible means of education or instruction in the ways of civilized life.

Where is the block in the way of educating these children? It is in Congress, which should appropriate the money. It is but just to say that there are men in Congress who appreciate the need of education for the Indian, who desire to have the money appropriated; but they are surrounded by such a dead-weight of indifference and ignorance that they can make little headway. This year the appropriations are inadequate, considering the needs and just demands. Treaty obligations, the appeal of the Indians through their agents, the urgent request of the Commissioner of Indian Affairs, and the plain setting forth of the Secretary of the Interior, failed to move the Congressmen from their short-sighted policy and false notions of economy. It is cause for congratulation that the present Secretary of the Interior is seriously and practically in earnest to secure education for the Indian. In his report he offsets war expenses against a plan for educating annually 10,000 Indian children, and adds:

"It is believed that with an annual expenditure of between five and six million dollars, during the next fifteen years, for educational purposes of the character indicated, the danger of Indian outbreaks may be avoided, and the great mass of Indian youth at least made self-supporting."

That such prudent counsel should fall short of practice for the lack of money gives rise to the query whether there remains any other available resource by which industrial education can be provided for the Indian in the near future. Turning to the report, we find that a considerable part of the 115,957,350 acres classed as untillable is adapted to herding. Men with capital and various corporations are coveting these plains, and even now negotiations are pending for the purchase of millions of these acres. Other portions of the untillable land lie in regions of known mineral wealth. Valuable mines have already been discovered, and prospecting parties are secretly pushing their investigations. The day is not far distant when these lands will also fall into the hands of those who can develop their hidden wealth.

The great reservations are sure to be broken up, and it is best that they should be, best for the Indians, best for civilization and for our own race. Isolation is ruin to the Indians, and brings injury to us as well. There is no safety for any people except in education, law, and freedom.

A considerable portion of the land held for the Indians is not secured by treaty, but by executive order; and when land of this tenure is withdrawn, little if any compensation will be given to the Indians. A detailed examination of the treaty lands shows that it is not prudent to delay longer the conserving of the land capital of the Indians. The income which can be secured from the sale of surplus lands will be none too large to meet the needs of industrial schools fitted to prepare the Indian youth to earn their living by intelligent labor, by which alone they can secure their future welfare and advancement. The well known "Civilization Fund" was derived from the sale of Indian lands. To that fund was mainly due the establishment of the industrial schools at Carlisle, Forest Grove, and Hampton, which herald the day of right-doing toward the native inhabitants of our land.

A. C. Fletcher.

On the Galloping Horse in Art.

THE article entitled "The Horse in Motion," which appeared in the THE CENTURY MAGAZINE, for July, 1882, describes how, at the instance and the expense of the public-spirited Governor Stanford of California, Dr. J. D. B. Stillman, a physician, and Mr. Eadward Muybridge, a photographer, investigated the sequence of attitudes taken by animals in quick motion, and their causes, and how in the five-thousandth part of a second an attitude was photographed at each foot of the stride of a galloping horse.

The truths discovered by these gentlemen are a most

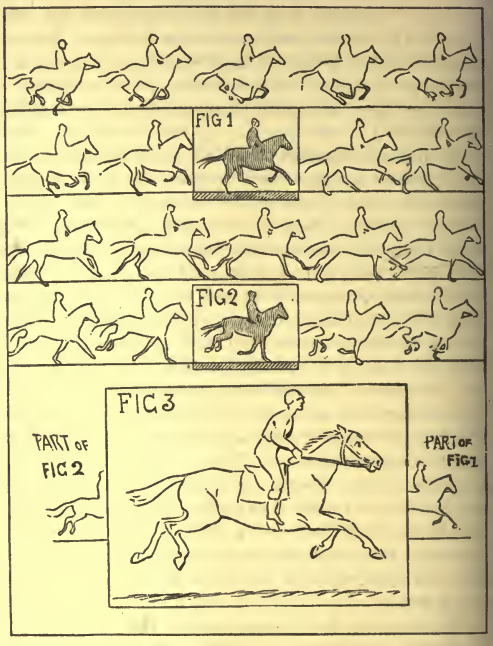
valuable addition to scientific knowledge, but it is the object of this article to prove that they have arrived at false conclusions with regard to the pictorial representation of the galloping horse. They call the manner in which painters have depicted the gait "the conventional and mythical gallop," and ask "if animal motion is always to be taught to follow such severely false models, wherein is it better teaching than that of the priests of Osiris, with whom all forms were stereotyped for thousands of years, and the last stages of their art were worse than the first";* and in such manner Dr. Stillman in his writings, and Mr. Muybridge in his lectures, contend that with the knowledge they have given them, artists are "false to their mission" if they "willfully persist in perpetuating a falsehood."

They seem to misunderstand the art of the pictorial artist, which is to reproduce by pigments sensations through our eyes similar to those produced through his eyes when he saw what he depicts, or what, from his previous experience, he knows would be produced had he seen what he depicts; and so, disregarding the important question of the effect produced on our eyes by objects in quick motion, they insist that artists should represent them as if our eyes were photographic cameras.

If the reader of this article will fix his eyes on any object, and then close them and open them as quickly as he can for one or two seconds, he will find that the object has not disappeared, though it has seemed to quiver, and yet each time the eyes were closed the object was shut out from sight; and if he possessed photographic cameras instead of eyes, the representation of what he saw would be a series of dark blanks and unquivering objects. He will also find that if he shuts his eyes for the space of one second and opens them for a second, he will then have alternate representations of blanks and unquivering objects, as the camera would give them. He will find, also, that winking as fast as he can, he does not open and close his eyes oftener than from three to four times in a second; so that the eyes do not give detached sensations of changes, which occur as often as four times in a second, and the impressions produced on them when more strongly affected, or for a longer portion of those short periods of time, eliminate those produced on them when less strongly affected, or for a shorter portion of the time.

The pace of a fast running horse is about a mile in one minute and forty seconds; that is, five thousand two hundred and eighty feet in one hundred seconds, or very nearly fifty-three feet in a second; so that if each stride of the gallop is twenty feet in length, the time taken in making it is twenty fifty-thirds of a second, or less than two-fifths of a second, and the time between each of the twenty positions taken by cameras set a foot apart, while the horse is making the sequence of attitudes given by them, is one fifty-third of a second, and this was the case with Governor Standford's mare Florence Anderson, whose stride was nineteen feet nine inches long.

A copy of the photographic illustrations of the attitudes during a stride of Florence Anderson is here given. The imitation of one of these twenty attitudes must be what Dr. Stillman advocates when, after criticising the manner in which painters have represented a horse galloping, he writes: "We are told that



the object is to represent action; would not that object be more readily attained if some position were represented which was known to be true, instead of one that is proved to be impossible?"

The winking experiment has proved that none of those attitudes will be seen detached, since they lasted but a five-thousandth portion of a second, and the sensation produced through the eyes must be a blending of impressions produced by a series of those positions. Let us consider two of those attitudes—Figure 1 and Figure 2; neither of these recalls to us our sensations when we saw a horse galloping. In Figure 1, we recognize the position taken by a horse who endeavors to commence his stride, but is restrained by his rider; he rises with three of his feet in the air, feels the restraint, and quietly settles down again, one foot remaining on the ground during the movement, which requires about a second for its operation. In Figure 2, we recognize the attitude of a horse kicking, except that the position of the near fore leg is not one which would last a second; but the "off" fore leg, rigidly planted on the ground, checks any idea of a change in its position for about a second of time.

Figure 3 is made up of the fore part of Figure 1 and the hind part of Figure 2; but this represents the galloping horse in what Dr. Stillman calls the "conventional and mythical gallop." So that manner does represent the fore legs and the hind legs in positions they actually take during the stride; but they are not in those positions at the same time. Let us make a chronometrical examination of this difference: Figure 1 and Figure 2 represent attitudes at distances apart equal to one-half of the stride, there being nine atti-

* See "The Horse in Motion," page 102. Boston: James R. Osgood & Co.

tudes between each; so that it having been shown that the whole stride is taken in two-fifths of a second, then one-fifth of a second is the time which elapses between the fore legs being in the position shown in Figure 3 and the hind legs being in the position there shown. The winking experiment shows that the eyes do not take note of their closure at intervals of one-fourth of a second; so it has "been proved to be impossible" that they should appreciate the difference of one-fifth of a second in the positions of the fore and hind legs.

On further examination, it will be seen, that for ten feet of the stride both the hind feet are off the ground, and for ten feet both the fore feet are off the ground, in four of the positions both fore and hind feet being off the ground; so that the impression on the eyes for half the time is that of both hind feet off the ground, and for half the time is that of both fore feet off the ground. One hind foot touches the ground for three feet, then both hind feet touch the ground for three feet, and then the other hind foot touches the ground for three feet. One fore foot touches the ground for five feet, and the other for five feet, one hind foot and one fore foot touching the ground at the same time in two of the positions.

If the reader will make another experiment, and move one of his arms backward and forward as if striking a series of blows as quickly as he can, and observe the effect in a mirror, he will find that the resultant effect on the eyes is the well-defined outline of the knuckles when the arm is at full stretch, the rest of its positions being indistinct. This effect may be accounted for partly because, however swiftly the movement may be given, there must be a pause at the reversal of the movement from forward to backward, and partly because the eyes are also excited by the reversal more than by the continuous movement in one direction.

In our winking experiment, the sensations produced while the eyes were closed are eliminated by the more powerful impressions produced during the longer period when the eyes are partly and fully open; and so with regard to the effect of the sequence of attitudes of the galloping horse, the impressions of the quick, involved actions of one foot after another touching the ground for one-tenth of a second are eliminated by those of the more conspicuous actions lasting throughout the whole stride of fore or hind legs, swinging in the air from positions near each other under the belly to the extreme boundary of the attitudes; and, like the knuckles in the experiment of the outstretched and retreating arm, the positions, when the legs are most outstretched, are those which most powerfully affect our eyes, and those positions, when painted, recall our sensations when we see horses galloping, while those shown on a photograph taken in the five thousandth part of a second do not recall those sensations.

George Snell.

"Strangulatus pro Republicâ."

IN THE CENTURY for December, 1881, was published, a fac-simile of the late President Garfield's singular death-bed autograph, "*Strangulatus pro Republicâ,*" and editorial comment was made to the effect that "the most diligent search and inquiry have failed to discover an earlier use of the Latin phrase."

It has just chanced to me to find in a familiar book a passage which may be held to cast some light on the source and sense of President Garfield's self-composed epitaph. In Bishop Ellicott's "Life of Christ," page 307, note 1, an extract is made from the commentaries of Dr. (now Bishop) Lightfoot ("Horæ Hebraicæ") on the Gospel of Matthew, in discussion of the term ἀπήγξατο as applied to the suicide of Judas Iscariot. "The explanation of Lightfoot," says Bishop Ellicott, "according to which ἀπήγξατο is to be translated '*strangulatus est, a Diabolo scilicet,*' is obviously untenable. We may say truly with Chrysostom, that it was the mediate work of Satan, but must refer the immediate perpetration of the deed to Judas himself."

Here we seem to have a chance glimpse into some rabbinical tradition or superstition that those who are killed directly by satanic agency "*strangulati sunt.*" I do not venture to offer this as any adequate elucidation of the tantalizing and obscure ἅπαξ λεγομενον of the late President's death-bed. But General Garfield was widely read, alike in theological and general letters; and who knows but that the idea — so natural in his then condition — that his assassination was due to direct diabolical agency, may not have knit itself more or less unconsciously in his mind about a dimly remembered phrase which in some sort suggested the source rather than the method of the deed?

Edward S. Gregory.

LYNCHBURG, VA., Feb. 19, 1883.

BRIC-À-BRAC.

Through the Wood.

THROUGH the woodlands when the day
Drives the dusky night away,
And the hill-top's pearly height
Catches first the creeping light,
And above the valley pale,
Slow the night-mists lift their veil—
Then, with whistle clear and low,
Down the woodland path I go:

Dim the dew upon the grass
Prints my footsteps as I pass,
And the cowslip's carpet sweet
Crushes 'neath my springing feet,
And the daisy-blossom's eye
Closes as my step draws nigh,
Lest I bruise her tiny cup,
Ere her lord, the sun, is up!

First I chirrup to the bird,
Ere from rest he scarce hath stirred;
Whistle shrill with laughing lip
Just to see the rabbit slip
Through the fern or budding clover
That his swift form closes over;

And with merry heart ring out
Now a carol, now a shout!

Thus I wander ere the sun
Half his midway course hath run,
List'ning to the forest noises—
Call of partridge, wild things' voices,
Yet with tenderest heart of all,
Where the cool damp shadows fall,
List'ning—list'ning—as I go
To hear the brooklet's water flow:

Flowing—flowing—'tis a song,
Glad I'd list to all day long;
For it tells me, soft and clear,
Of a woodland cottage near;
And beneath that woodland shade
Lingering waits a brown-eyed maid:
Hasten, brooklet! whisper low
All thy tell-tale wave doth know!

William M. Briggs.

The Train.

HARK!
It comes!
It hums!
With ear to ground
I catch the sound,
The warning, courier-roar
That runs along before.
The pulsing, struggling now is clearer!
The hill-sides echo "Nearer, nearer,"
Till, like a drove of rushing, frightened cattle,
With dust and wind and clang and shriek and rattle,
Passes the Cyclops of the train!
I see a fair face at a pane,—
Like a piano-string
The rails, unburdened, sing;
The white smoke flies
Up to the skies;
The sound
Is drowned—
Hark!

Charles H. Crandall.

"The Lady, or the Tiger?" or Both?*

I.—THE PROBLEM.

A MONARCH wise; two ladies fair;
A youth not blessed with rank or money;
A Royal Tiger from his lair;
These are our *dramatis personæ*.

The king was great! That potentate
Full wisely steered the ship of State;
And most of all, his shrewdness showed
In his Majestic Penal Code.

An amphitheater, nobly used,
Served as a court where each accused
By his own act strict justice got;
Or—'t was *his* fault if he did not.

The culprit, real or supposed,
Was placed before two portals closed;
Then, uncontrolled, self-guided quite,
He took his choice 'twixt left and right.

Behind the one, in wait for him,
A tiger lurked, severe and grim.
The other hid a lovely maid,
Young, rich, for wedlock all arrayed.

Which door to open? Death or life?
A beast of prey! A lawful wife!
No wonder if he gasped and tarried:
We all do, when we're killed—or married.

The trial, from its institution,
Down to the final execution
(Not having any lawyers in it),
Took just the space *of half a minute.*

In this grand scheme of penal laws—
So free from doubt, delay, excitement—
Each of the tiger's separate claws
Was a "separate clause" in the indictment.

Said we not well this king was shrewd
Who this strong, simple plan pursued?
The crowd amused—Law vindicated—
The tigers fed—the maidens mated!

The king's own daughter's inclination
Was toward a youth of lowly station,
And since he was, like Barkis, "willin',"
He *must* have been a hardened villain.

So the police pursued him, caught him,
And to the Colosseum brought him;
And thither came the monarch proud,
The princess, and the baser crowd.

Behind the scenes another maiden
Attends, with all her gewgaws laden.
While close at hand, to left—or right—
The tiger—with his appetite.

The throng now see the culprit enter
And pause at the arena's center:
Turn, face the royal box, and bow;
Alas! How feels the princess now?

She only, favored by the Fates,
Knows the dread problem of the gates
Which hides her rival's hateful face,
And which the tiger's lurking-place.

Her luckless lover vainly tries
To read her secret in her eyes.
What sign can reach his straining sight?
She lifts one lily hand—the right!

*See story of "The Lady, or the Tiger?" by Frank R. Stockton, in THE CENTURY for November, 1882.

A HORSE-RACE AT A

He sees the sign; he must obey;
He bows again and turns away;
Faces the double-gated wall,
Advances firmly, and — that's all!

Right here the story halts. The sequel
Its author left with chances equal.
Did Love decree the youth's survival,
Although united to a rival?

II. THE SOLUTION.

THIS tiger, savage, sleek, and strong,
Had fasted there alone and long
And grown to be far hungrier than a
Wild quadrupedal Doctor Tanner.

He sniffed the wall that did divide
Him from the maid on t'other side.
One sniff, two sniffs, three sniffs were all;
Then he forthwith *tore down the wall.*

* * * * * * *

Sir Tiger now has had his fill.
Another pound would make him ill.
He's no more need for persons raw,
Than Barnum's tiger stuffed with straw.

Too long we've let our hero stand
Since his fair princess raised her hand.
Boldly he opes the right-hand portal—
Then staggers back in terror mortal!

From out the gate-way, crouching low,
The tiger steps, sedate and slow.
Stops, stoops, unsheathes and sheathes his claws,
While all may note the awful paws!

He gives the youth a scornful glance
And passes on with looks askance.
He does not seem to care to eat him —
Meets him, in fact, but doesn't meat him.

He smooths his whiskers, walks the ring,
Winks at the princess and her lover,
Then smiles serenely at the king
And scans the multitude all over.

His lordly form and bearing made
Fit setting for the part he played.
He on the sands of that theayter
From top to toe looked glad he ate her.

He peered and purred and paced awhile
With that same soft, seductive smile,
Then to a shady corner crept
And laid him down and sweetly slept.

The king in this a portent sees.
Quoth he, while quake the royal knees,
"Go, daughter, quickly as you can
And wed that praiseworthy young man."

The princess trips across the sands
To where her lover waiting stands.
They're married fast, mid cheers and laughter,
And then — live happy ever after.

Oft did the swain in later life
Demand the secret from his wife;
And by all arts strove to oblige her
To tell *which door had hid the tiger.**

But she, as all historians say,
Kept silent to her dying day:
So no step further ever made he
To solve the problem "Death or Lady."

Joseph Kirkland.

Baboo Lore.

THE following are copies, for the most part, of original letters received by myself and friends from various native writers during a residence of some years in Calcutta.

They are principally written by baboos or "Hindu gentlemen" clerks — men educated at the English schools, or Government colleges — where the text-books used are the works of Shakspere, Milton, Bacon, Johnson, or Goldsmith. The result of a frequent and almost exclusive perusal and study of these old-time English classics, coupled with the oriental propensity for figurative and exaggerated expression, is a diction altogether unique.

D. W. Howland.

CALCUTTA, 20 September, 1881.

HONORED SIR: A time is fast drawing nigh when I shall have positively to die of inanition, unless you condescendingly, pity-moved, and graciously take upon yourself a generous and virtuous, although immensely troublesome, task, that is to say, to pre-save me as early as feasible from so perilous and imminent an event, by placing me under your benign care — departmental, personal, both.

Permit me, however, to auto-introduce myself in a brief word or two.

I am a native, uninitiated to office duties, born and reared in a locality where education is still a nonentity *per se*: after much ado, have gained a slight smattering in English, but blessed with a capital character, well-behaving, and sweetly submissive.

* The g is soft here.

COUNTRY FAIR. [AFTER MUYBRIDGE.]

What I cravingly and humbly solicit you for is to allot me some work here, so that a needy soul of my ilk may have some means to support himself. If there be no salaried room spareable know, I pray even for an apprenticeship of the lowest genus, and confidently hope not to be disappointed, on an isolated score of my being an uncouth and unwelcome stranger.

Awaiting at the door for a favorable and forthcoming order,

I remain, sir, obediently yours,

(Signed) MOHENDRO NAUTH CHUNDER.

11 Sunkur Halders Lane, Ahmreetollah, Calcutta.

P. S.—Please take a note of my name and address, and kindly show this somewhat queer and obtruding application to all your friends and acquaintances, in order to pick me up altogether, for the sake of Him, who feedeth all!

CALCUTTA, ———

HONORED SIR: I regret to inform your honor, that I am unable to appear at my post this morning, as I am suffering severely from a carbuncle, as per margin.

Yours ffly,

——— ———

BOMBAY, ———

MESS. ———, CALCUTTA.

GENTLEMEN: We last had this pleasure on the —— inst., and we now have the honor to report the death of our respected senior, which occurred on the —— inst.

Since our last cotton has advanced ¼ anna, and freights are a trifle firmer.

"Oh, Death, where is thy sting,
Grave, where is thy victory?"

Exchange, 1*s.* 9*d.*

Yours ffly,

——— ———

GYA, 19 December, 1880.

To MR. ———

HONORED AND MUCH RESPECTED SIR: With due respect and humble submission, I beg to inform you, that long days past, I have no notice about your health, therefore my mind is very much anxious to know. Now I beg from your noble and generous heart, that please let me know about your health. Sir, don't forget at once me. I am the same poor Kalli, whom you loved very much, and present best silver watch. Sir, now again I ask a post at your office; now do for me whatever your honor and generous heart please.

Hoping this will find you in cheerful spirit,

Your most obd't servant.

MONGHYR, ———

HONORED SIR: I am your same poor slave, who loves you very much, and I beg to inform you, that please let me know how you are. Sir, I am very much like to serve under your feet yet, therefore I hope that your honor will consider again for me in your noble heart. If your honor and generous heart will allow you to send me an answer, then kindly write in your own hand, for my mind is always glad to see you, for this reason I will satisfy my mind in some portion, by seeing your generous handwriting.

Your obd't servant,

——— ———

CALCUTTA, ———

——— ———

MOST NOBLE SIR: Cherisher of the poor. May your prosperity be eternal!

I most humbly and respectfully beg to bring to your honor's kind notice, that I served under your disposal for a period of upwards of ten years, and performed my duties to the entire satisfaction of my superiors, during that period any fault or mistake not done by me, on which your honor summarily dismissed me, without inquiring any cause. Hoping that your honor will reëngage me in my position, I have strong hopes from your honor to support me and my whole family, and consequently necessity urges me to bring my deplorable case before you, and hoping that my humble circumstances may be taken into your favorable consideration.

For this act of great kindness and charity, I shall ever pray for your honor's health, wealth, and prosperity.

I have the honor to be, sir,

Your obedient dismissal,

KOONJEE DURWAN.

JALLANDHERE, ———

RESPECTED SIR: I most humbly and respectfully make a profound bow to beg the favor of your generous authority and prosperity which courteously assures me to have a perfect strength of furnishing me with one of the posts of draftsman, or suboverseer, or subsupervisor, still if there be no vacated post.

But what I do. I have no means to help myself. Now hearing your generosity, I humbly venture to pursue, in prayer, by clutching your blessable feet, and throwing myself at their highness. I take you by the coat in a begging posture, and if you accept this, surely I hope that this action will, together with the prayers I express, help me to move your compassion, and you will take me doubtless under your protection.

I have no recommendation, force, or other interposition by means of which I may receive your favors.

Yours, etc.,

——— ———

CALCUTTA, Nov. 20, 1879.

MY DEAR AND MOST HONORED SIR JOSEPH: I am one very poor man, got one very large family, cannot afford in dwelling present state of financial cripplement to be in presence at your honor's performance. Six rupees—too much excessively, eight annas—just like thing, dear and adored sir; reduce only for one poor baboo, and all miserable baboo race, send programme down to office please,—all baboo like very much.

Wishing success and enlargement of family, I remain your most faithful and adored praiser,

(Signed) CHOOTYPYDID BANDYPYDID.

Look at Browning!

("JOCOSERIA.")

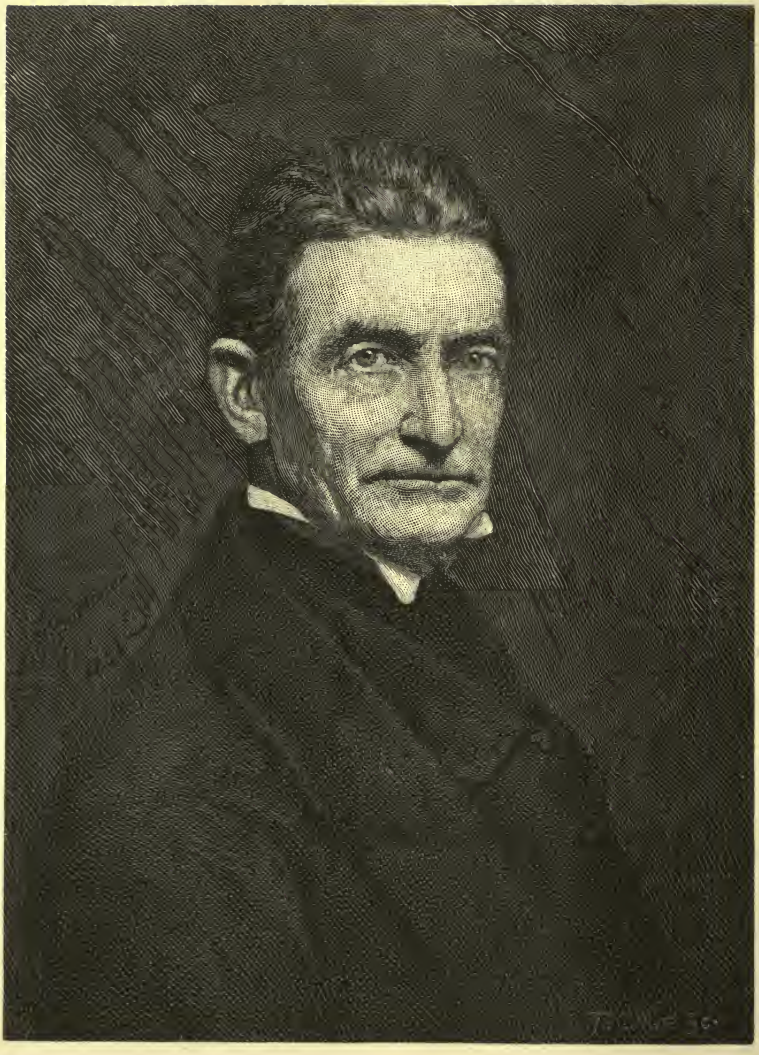
MEN grow old before their time,
With the journey half before them.
In languid rhyme
They deplore them.

Life up-gathers carks and cares,
So good-bye to maid and lover!
Find three gray hairs,
And cry, "All's over!"

Look at Browning! How he keeps
In the seventies still a heart
That never sleeps,—
Still an art

Full of youth's own grit and power,
Thoughts we deemed to boys belonging,—
The spring-time's flower,
Love and longing.

R. W. G.



John Brown

THE CENTURY MAGAZINE.

VOL. XXVI. JULY, 1883. No. 3.

STRIKING OIL.

NEARLY all the petroleum that goes into the world's commerce is produced in a district of country about a hundred and fifty miles long, with a varying breadth of from one to twenty miles, lying mainly in the State of Pennsylvania, but lapping over a little on its northern edge into the State of New York. This region yielded, in 1881, 26,950,813 barrels, and in 1882, 31,398,750 barrels. A little petroleum is obtained in West Virginia, a little at various isolated points in Ohio, and a little in the Canadian province of Ontario. There is also a small field in Germany, a larger one, scantily developed, in Southern Russia, and one still larger, perhaps, in India. The total production of all the fields, outside of the region here described, is but a small fraction in the general account, however, and has scarcely an appreciable influence upon the market. Furthermore, the oil of these minor fields, whether in America or the Old World, is of an inferior quality, and so long as the great Pennsylvania reservoir holds out, can only supply a local demand in the vicinity of the wells.

The petroleum region of Pennsylvania and New York is a hilly or mountainous country, covered largely by forest growth and drained by the Allegheny River or its tributaries. It must not be supposed that the oil-bearing sandstone stratum underlies all this region. It is found only in spots, patches, and belts, and there are no surface indications to show where it can successfully be sought. The entire productive territory covers an area of only 180,000 acres. The outlines of a producing district are established only by experiment, and new districts are discovered by wasting large sums of money on "dry holes." When once a new "pool," or belt of producing territory, is found, the wells multiply rapidly on all sides of the pioneer well until the limits are found. When a dry well demonstrates that the edge has been reached in one direction, no more are bored so far out; and so it is in other directions. After the territory is outlined, it is tolerably safe to bore within it, though there will be important differences in the yield of wells close together, and as the number increases the average yield will diminish.

A glance at the accompanying map will show the shape and extent of the different producing fields. The first to be developed was the Oil Creek field, with the outlying pools of Pithole and Pleasantville and the little belt near Tidioute. Next in order came the Butler, Clarion, and Warren fields; then the great Bradford field, the Allegheny field, then the phenomenal and disastrous Cherry Grove field; and, last of all, a little pool lying in the extreme southern end of the region and called Bald Ridge. It will thus be seen that production, beginning in the center of the now known region, has been pushed north-east and south-west, constantly opening new fields of greater or less extent, but never going very far off a diagonal line on the map. Oil men talk a great deal about the forty-five degree line, and believe that any future discoveries of producing territory will be found either on an extension of that line or in the gaps that now exist in it.

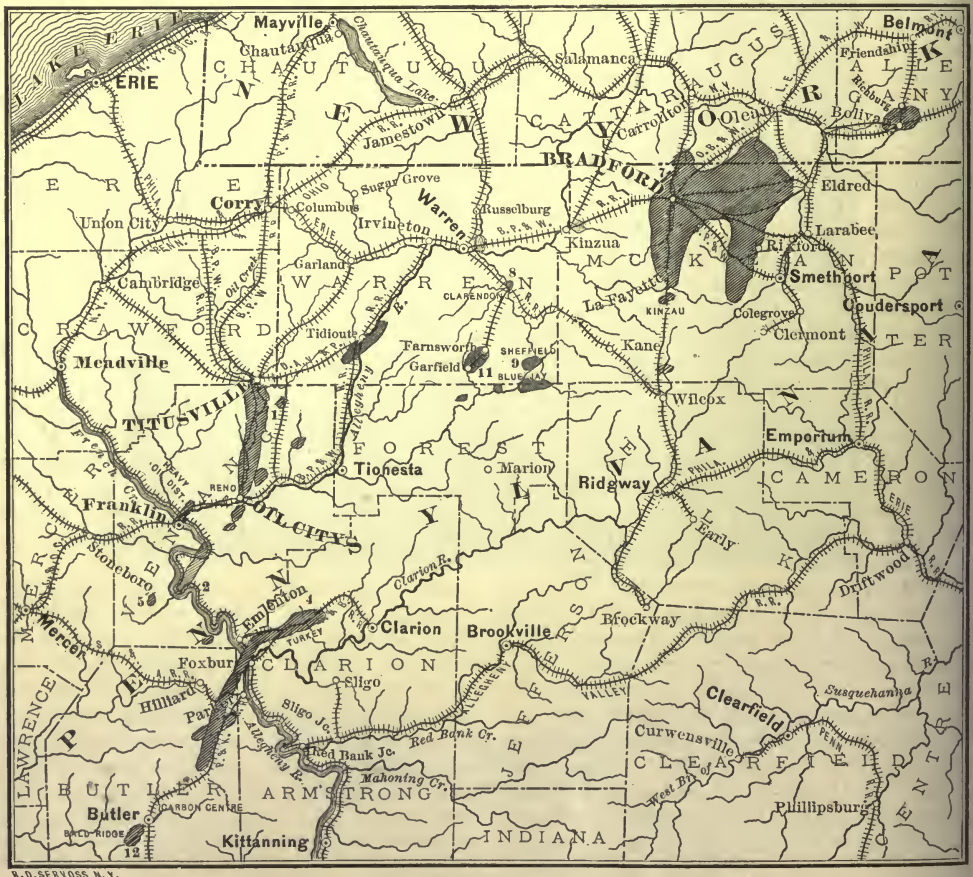
The older districts are now nearly exhausted. A little oil is got in them by pumping; but more than nine-tenths of the wells that used to flow abundantly are now abandoned, and only the blackened and rotting derricks mark their location. Towns in these districts which once counted their inhabitants by thousands, and were busy marts of trade and speculation, have absolutely perished and disappeared from the face of the earth, leaving scarce a vestige behind. The outlines

[Copyright, 1883, by THE CENTURY CO. All rights reserved.]

of the old streets can be seen in the fields, but the houses have been pulled down or carried off bodily.

In speaking of the different producing districts, I have not mentioned that surrounding the town of Franklin. Its product is a heavy oil, used in its natural state for lubricating purposes, and worth five or six times as much as other crude petroleum. Only a small quantity is obtained, and the article is as distinct from the general product of the region as though it were lard oil or sperm oil. A few barrels of this thick oil are also obtained from wells at Mecca, in Trumbull County, Ohio, and a few in Illinois.

On Oil Creek, the first wells struck the oil-bearing sandstone at a depth of 600 feet. In the Butler and Clarion fields the wells are about 1400 feet deep, in the Bradford field from 1100 to 2000 feet, in the Allegheny field from 900 to 1400 feet, and in Cherry Grove 1600 feet. The variation of depth in the same field is caused by the hills. The oil stratum lies on a level, and a well sunk on a hill-side or a hill-top must go down as much deeper than a well in a valley as its mouth is elevated above the valley. In the early days of the oil business, all wells were sunk in valleys; but, after awhile, it was found that there was just as good producing territory on the slopes and summits of the neighboring hills, and a matter of three or four hundred feet more drilling was not important. The oil sand-stratum varies in thickness from five to thirty feet. It is thickest in the Bradford field. There it is dark colored and fine-grained; elsewhere it is of lighter color and more porous. There are no streams or ponds of petroleum in the earth, as was once supposed. The sandstone is saturated with the oil, and a strong pressure of gas forces the fluid through the porous rock and up to the surface when a hole is drilled down to it. After the gas pressure is relieved, a well is pumped, sometimes for a few weeks only, sometimes for years. Some wells flow intermittently, from periodical accumulations of gas; some continuously until exhausted. Some will yield only a barrel a day; some have been known to spurt three

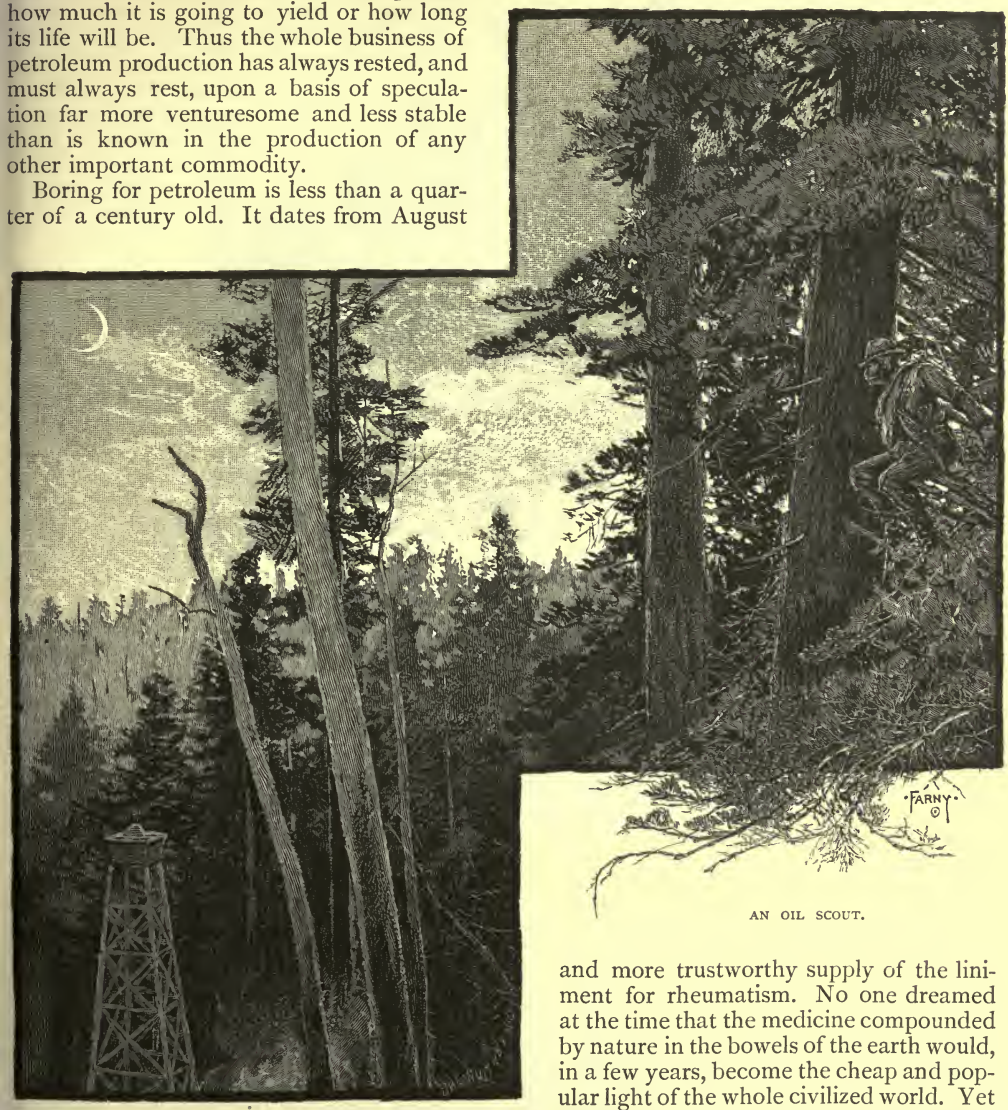


R.D. SERVOSS N.Y.

MAP OF THE OIL REGION.

thousand barrels within the first twenty-four hours after the drill struck the oil sandstone. Of all forms of property, an oil well is about the most uncertain. No one can predict how much it is going to yield or how long its life will be. Thus the whole business of petroleum production has always rested, and must always rest, upon a basis of speculation far more venturesome and less stable than is known in the production of any other important commodity.

Boring for petroleum is less than a quarter of a century old. It dates from August 30th, 1859, when Colonel E. L. Drake struck oil on the Drake farm on Oil Creek. He had faith that the greasy, bad-smelling fluid which floated on the surface of the creek and oozed from crevices in the rock could be found in large quantities by sinking wells. This fluid had long been sold by a patent medicine company, under the name of Seneca Oil, as a remedy for rheumatism. Its curative virtues were known to the Indians at an early day, and they used to gather it by stretching their blankets on the surface of the water and then wringing out the oil absorbed in the fabric. It was the patent medicine company that furnished Drake with the money to bore the first well, the motive being to procure a larger and more trustworthy supply of the liniment for rheumatism. No one dreamed at the time that the medicine compounded by nature in the bowels of the earth would, in a few years, become the cheap and popular light of the whole civilized world. Yet the value of rock oil for illuminating purposes was known long before. In the "American Journal of Sciences" for 1826 there is a letter from Dr. S. P. Hildreth, who speaks of the discovery of petroleum on the Muskingum River, near Marietta, Ohio, by a man who sunk a well for salt water. The searcher for brine put down a hole four hundred feet, and, instead of salt water, it "discharged vast quantities of petroleum or, as it is vulgarly called, Seneca Oil." Dr. Hildreth speaks of powerful explosions of gas from the well, and goes on to say that "the petroleum affords considerable profit, and is beginning to be in demand for lamps



AN OIL SCOUT.

GUARDING A WILD-CAT WELL.

in workshops and factories," and that " it gives a clear, brisk light, and will be a valuable article for lighting the street lamps in the future cities of Ohio." Probably the well on the Muskingum soon ceased to flow. The tradition of it remained, however, and after the Oil Creek discoveries, new wells were sunk near its site which produced and, I believe, still produce a few barrels each per day.

The new light soon found favor in the United States. In 1859, Colonel Drake's well produced about 2000 barrels of oil; in 1860, new wells brought the total yield up to 500,000 barrels; in 1861, it was 2,113,609 barrels, and in 1862, 3,056,690. Inventions speedily produced improved lamps to burn the new fluid, and refiners succeeded better and better from year to year in taking out the substances that clogged the wicks and made the lamps smoke. The " coal oil," as it was then generally called, taking the name before applied to kerosene distilled from coal, did not compare in purity and light-giving quality with the refined oil of the present day; but it was cheaper and better than any lamp oil then in use. In fact, it supplied an urgent demand of the whole world for " more light." The whale had almost been exterminated, and sperm oil was so dear as to be out of the reach of the poorer classes. Candles made of tallow were the common light of people living outside of cities where gas was provided. They were costly in proportion to the light they gave, and it was a poor light at best that could be got from them by frequent snuffing. A fluid called " camphene " was made from turpentine, which was a slight improvement on the tallow dip. Later, an oil was made from bituminous coal in considerable quantities. Poor people could not afford sufficient light to read by of evenings. A few flickering candles were all that the economy of the ordinary class of farm-houses allowed. Who can estimate the value of the work

petroleum has done in twenty-three years for intelligence, culture, and the household virtues? It has made the evenings bright and cheerful in millions of homes. The luminous lamp invites to study and reading, to social games and music, to good conversation, to wit and merriment. In a word, it is a powerful force in the advancement of civilization, —a force which the social scientists, who have so much to say about railroads and electricity, rarely take into their account of the world's progress.

The production of crude petroleum fell off in 1863, 1864, and 1865; but the discovery of the new Tidioute district and of the famous flowing wells of Pithole brought it up, in 1866, to 3,887,700 barrels. The Butler and Clarion counties fields, and fresh discoveries in Venango County, ran the production up steadily during the following years, until it reached 10,809,852 barrels in 1874. Then came two years of decline, the older wells giving out and the newer ones yielding less and less. In 1875, the Bradford field was discovered. Its development proceeded so rapidly, and it proved to be of so great extent, that, in 1880, its yield was double that of all other fields in 1874, and about six times as great as all others at that time. Of the 26,000,000 of barrels produced in 1880, over 22,000,000 came from the Bradford district. The Allegheny district was opened in 1881, and now ranks next to Bradford; and the phenomenal Cherry Grove field in Warren County had its rise and fall in 1882. A number of small districts, or pools, in Warren, McKean, and Venango counties were opened between 1875 and 1881.

For sudden and enormous effect upon values, the Cherry Grove excitement of last summer was without parallel in the history of the petroleum trade. It surpassed the famous Pithole furore of 1865. Cherry Grove is a wilderness township of Warren County, which, prior to last May, was almost uninhabited, its population consisting of half a dozen farmers and a few tan-bark cutters. On election night, the politicians at the county seat used to know exactly how the township would vote, and did not need to wait for the returns from that quarter when figuring up the result. For many years the vote stood twelve Republicans and two Democrats. Nearly in the center of the township was a little clearing embracing a few farms; all the rest was a dense, primeval forest of hemlock and birch, where so little light penetrated the canopy of interlaced branches that it always seemed after sundown. About ten miles from the clearing lay the little oil town of Clarendon, on the Philadelphia and Erie Railroad,—a pocket-field, as the oil men call it, developed about ten years ago, and containing about two hundred wells within sight of the railway station. The "wild-catters," as the prospectors are called who take the risks of sinking wells in unknown territory, had long had a theory that oil would be found south-west of Clarendon; but it was only in the spring of 1882 that a party of four of them ventured to put up a derrick in the clearing in Cherry Grove and began to drill. There seemed to be a premonition in the oil exchanges of the tremendous consequences to follow the sinking of 646, as the well was called, from the surveyor's number of the lot upon which it was located. Its progress was observed with feverish interest. The leading oil brokers of Bradford and Oil City employed scouts to watch it after the hole had got down nearly to the depth where it was expected the oil-bearing sandstone would be reached, and to make daily reports of its condition. The owners boarded the derrick up and stood guard at night with shot-guns, firing at random into the woods to keep the spies from getting near enough to learn anything. In spite of these precautions, one young man managed to evade the guard, and, crawling up to the well in the night, concealed himself under the derrick floor, where he lay for seventeen hours, escaping at last with the precious knowledge that 646 was a flowing well—knowledge which, it is said, brought fortunes to him and to the brokers who employed him.

When at last the mystery about the Cherry Grove well was cleared up, and the fact was established beyond dispute that it was spouting out the largest stream of oil that ever came from a single well,—actually yielding four thousand barrels the first day,—the effect was tremendous. It is estimated that in a few days' time the value of oil on hand and of oil territory and wells suffered a shrinkage to the enormous amount of thirty millions of dollars. Crude petroleum, which had been selling at eighty-five cents per barrel, tumbled down and down and down until it got to forty-nine cents—a figure far below the cost of production by any except big-flowing wells. The reader will ask why the opening of a single well, even though it produced the prodigious yield of four thousand barrels a day, should have been followed by such serious results. The answer is, because every one in the oil regions knew that it was not a question of one new well but of a new producing district, and that scores and perhaps hundreds of other wells would soon be flowing within gun-shot of 646.

In a few days the hemlock woods of Cherry Grove township were alive with men and

IN THE DERRICK-HOUSE — DRILLING.

teams, hauling boilers, engines, drilling-tools, lumber for derricks and shanties, kegs of beer, boxes and barrels of provisions, furniture,— all the equipment, in short, of a new settlement. It was May 17th when 646 struck oil. Before the end of June, two bustling towns had sprung up near by,— one called Garfield, in honor of the martyr president, and one Farnsworth, for the owner of the farm where the wonderful well was sunk. Land that had lately been sold at four dollars an acre to pay the taxes changed hands in five-acre tracts at from $500 to $1000 an acre. Hotels, stores, machine-shops, saloons, and a theater sprang up as if by enchantment. The forest aisles, but lately sunk in the silence of centuries, resounded with the shouts of teamsters, the clatter of machinery, the clinking of sledges upon anvils, the sharpening of drills, and the noise of saws and hammers. By the first of October, three hundred and twenty-one producing wells had been sunk in the Cherry Grove territory, each well representing an average expenditure, for engine, derrick, boring-tools and equipment, of three thousand dollars. Thus, over a million of dollars was spent in four months' time upon a little strip of Pennsylvania forest and clearing two miles long by half a mile wide.

The wells that struck oil soon after the great success of 646 all yielded heavily, with the exception of a few that were sunk outside the narrow producing belt, and that served, by their dry holes, to define the limits of the belt. A thousand-barrel well was no wonder in those exciting days, and a man whose well only spouted five hundred the first twenty-four hours after he struck the oleaginous stratum thought he had but moderate luck. But as new wells were put down the flow of the older ones steadily decreased, under a law that governs all newly opened petroleum districts. There is only a given quantity of oil in the ground under pressure of gas, and the more the subterranean reservoir is pierced, the less powerful is the gas pressure, and the flow from each aperture is necessarily diminished. In August, the Cherry Grove field produced forty thousand barrels a day; but from that maximum it steadily declined, and when I visited it in October, the total daily yield from all the wells was less than the yield of 646 during the first twenty-four hours after it commenced flowing. Many wells were abandoned, and the tools and machinery were being removed to other fields. Even under the discouragement of the rapid collapse of the district, however, new wells were being sunk. Probably the field will yield two or three thousand barrels a day for some years to come, from a hundred wells producing a few barrels each; but its importance has gone, and with it the fortunes of hundreds of eager speculative men, who rushed in to share the

SHOOTING A WELL.

profits of the big strike. With its partial failure, however, the price of oil has gone up, and prosperity has returned to the whole petroleum country. When crude oil brings ninety cents or a dollar a barrel, everybody is happy; when it goes down to fifty cents, times are hard, and nobody wears a cheerful face save the speculators who have sold "short."

The tools and appliances employed in sinking a well are few and simple. A derrick is first built of cheap hemlock lumber, and attached to it is a rude shed which shelters the steam-engine and the machinery for working the drill and sand-pump and for pumping the oil. Frequently the boiler is placed out-of-doors, without protection from the weather, and it usually stands at some distance from the derrick, so that it will not be injured in case the rest of the "rig" is destroyed by fire. The engine works a huge rude walking-beam which, by the movements of one arm, gives the motion to a stout cable, passing over a pulley at the top of the derrick, required to raise and lower the drill. Attached to the derrick is also a big windlass, called the "bull-wheel," which hoists the drilling apparatus out of the well. There is also a smaller windlass, called the sand-reel, which serves to lower and raise the sand-pump. After the rig is got upon the ground, a drive-pipe is forced down through the earth to the rock. The drilling tools consist of the "bit," which is a long bar of iron as heavy as a man can lift, with a sharp end to cut and pound the rock, the "auger stem," an iron bar perhaps

eight feet long screwed into the bit, the "jars," two heavy bars linked together, the "sinker-bar" resembling the auger stem, and the "rope-socket." All these implements, fastened end to end, reach nearly to the top of the derrick when hoisted out of the well. Then there is the "temper-screw," which lowers the drilling apparatus inch by inch as it goes down, and the "sand-pump" and "bailer," employed to take up and hoist out the pulverized rock and water. Once every six feet, in the progress of a well, the creaking bull-wheel is set in motion, the drilling apparatus is hoisted out, and the sand-pump (a cylinder with valves) is lowered and raised with the detritus. Frequently, the bit is unscrewed and sharpened at a forge under the derrick frame. Two or three men are sufficient to put down a well. The movements of the engine are controlled from the derrick by a simple apparatus of cords and wheels. When the well is down about three hundred feet, the "casing," a six-inch iron tube, is put in to keep the water from veins in the rock from getting into the well. When the oil-sand is struck, the oil, mingled with gas, spurts up with great force, perhaps as high as the derrick. Then the "tubing," two inches in diameter, is put in, and a "seed-bag" is forced down between it and the casing. The tubing runs to a tank several rods from the well, into which the oil flows as long as the well is a flowing well, and from which it is afterward pumped.

It costs about 80 cents a foot to sink a well by contract. The cost of a finished well, with apparatus complete, varies from $3000 to $4000, according to the depth at which the oil stratum is found and the expense of getting the engine and boiler on the ground. If a well proves a dry hole, or fails to yield enough oil to pay for pumping, and the owner removes the machinery to other ground for a fresh experiment, he is out of pocket from $1000 to $1500.

When a well is completed and productive the drilling apparatus is by no means useless. Occasionally the well must be cleaned out, or, perhaps, bored a little deeper. It does not always behave well, and it is necessary to find out what the matter is. In connection with the "outfit," as a Western man would say, must be mentioned the "sucker-rods," long sticks of ash coupled together and used in pumping, and the "fishing tools," which come into important service when the drilling apparatus or the rope breaks in the well.

When a well fails it is usually "torpedoed" to start the flow afresh. A long tin tube, containing six or eight quarts of nitro-glycerine, is lowered into the hole and exploded by dropping a weight upon it. The tremendous force of the powerful explosive tears the sand rock apart and loosens the imprisoned oil and gas. Nothing is heard on the surface save a sharp report like a pistol shot, but the ground heaves perceptibly, and pretty soon the oil comes spurting out in a jet that breaks in spray above the lofty derrick. The "torpedo man" is one of the interesting personages of the oil region who is seen with most satisfaction from a distance. He travels about in a light vehicle with his tubes and his nitro-glycerine can, traversing the rough roads at a jolly round trot, taking the chances of an accidental explosion, and whistling or singing as he goes. Sometimes the chances are against him, and a blow of a wheel against a stone sets free the terrible force imprisoned in the white fluid in his can. There is no occasion for a funeral after such an accident, for there is nothing to bury. Man, horse, and "buggy" are annihilated in a flash, and an ugly hole in the ground and a cloud of smoke are all that is left to show what has happened. The torpedo company buys a new horse and hires a new man, and there is no more difficulty about one transaction than the other. The business of "torpedoing" wells is in the hands of a single company, which has made a large amount of money from a patent covering the process of using explosives under a fluid. Most oil producers regard the patent as invalid, because nature supplies the fluid in the well into which the nitro-glycerine tube is lowered; but the courts have sustained the patent. Sometimes well-owners "torpedo" their wells stealthily by night to avoid paying the high price charged by the company. This operation is called "moonlighting," and many lawsuits have grown out of it.

In the whole Pennsylvania and New York field, the number of producing wells is at this time not far from 20,000, of which about 13,000 are in the Bradford district. The number of "dry holes" and exhausted wells no man has endeavored to compute. It is a common saying in the region, however, that since 1879 more money has been put into the ground than has been got out of it. No consideration of the general interest of the trade or of the risk involved in sinking new wells checks the business of boring. Production constantly runs ahead of consumption. It is useless for the newspapers in the oil country to show how much more prosperous the trade and all dependent upon it would be if the price of crude petroleum were kept up to a dollar a barrel, by limiting production. As soon as the price goes up high enough to be fairly remunerative, hundreds of new wells are sunk in old territory, and "wild-catting" becomes active.

A BURNING WELL AT CHERRY GROVE.

"Wild-catting" is the name applied to the venturesome business of drilling wells on territory not known to contain oil, in the hope of finding it. A man engaged in this pursuit is called not a wild-cat, but a "wild-catter." The typical "wild-catter" is a restless, speculative person, rich to-day and poor to-morrow, now making a lucky strike, and now sinking all his available means in a dry-hole. He has wonderful vitality, and never gives up. If "dead-broke," he will always manage to borrow money enough to sink "just one more well." When he begins to put down a wild-cat well, he usually leases all the land in the vicinity, agreeing to pay from one-eighth to one-fourth of the oil obtained if any is found. Should he make a strike, he sells his leases, for a handsome bonus, in tracts of five acres each, and pockets at once a large sum of money besides what he makes from his own well. Sometimes the "wild-catter," finding he has got a dry hole, secretly conveys a few barrels of oil to the spot in the night, empties them on the derrick platform and the ground, and manages to make a profit by selling his leases before the fraud is discovered. This operation corresponds to what is called "salting a mine" in the gold and silver regions of the far West.

Petroleum wells exist in India which are said to have been flowing for thousands of years. Doubtless the business of gathering the oil to serve some simple uses in its crude state is as old as civilization. Talking one day about the first discoveries of oil with a "wild-catter," on one of the narrow-gauge railway lines that run over the mountains and through the forests to reach the wells of Warren and McKean counties, the man said:

"Why, the oil business is no new thing. It's as old as the Scriptures. Job was an oil man. He struck the rock and it poured forth rivers of oil. He got rich in the oil business."

"Yes," chimed in a stranger on the other side of the car, "and that's the way he got his boils. I know men who can't be about oil wells without getting boils. They breathe in the carbon, and it goes into their blood."

The "wild-catter" agreed to this theory, and added that he had no doubt Job's wells took fire, burned up his children, and reduced him to poverty. As he was speaking, we saw a large column of inky black smoke rising above the forest to the right of the train. "A tank's on fire," said the brakeman. The news caused a movement of excitement in the car; some of the passengers went out on the platform, others put their heads out the windows, but the occurrence did not appear to be so unusual as to cause lasting interest. A curve in the road soon brought the train near the fire. A tank belonging to a well was burning with tremendous fury, making a great circular mass of rosy flame, and throwing up an enormous volume of smoke. It is no rare thing, I learned, for the small wooden tanks attached to the wells to take fire; but when one of the large storage tanks of the

Pipe Lines is struck by lightning, the spectacle is so magnificent that people gather from miles around to witness it. The owners make haste to bring a cannon by special train from the nearest town, and shoot holes in the tank to let the oil run out. None of it is saved, but if it is not released the tank boils over and bursts, and other tanks near by are ignited. Lightning is the great enemy of the big iron tanks.

Probably the most beautiful sight ever witnessed in the oil regions was that of the burning well in the Cherry Grove district last summer. A flowing well, yielding over a thousand barrels a day, took fire. The derrick was soon consumed, and the blazing fluid, spouting up high in the air and breaking in a shower of fiery drops, continued to burn for four days,— a wonderful fountain of fire in the midst of the forest. It was finally extinguished by shooting off the casing head with a cannon shot, and then applying an ingenious device for plugging the well below the fiery column.

The method of producing petroleum, as described above, has undergone but little change since the first wells were sunk in Oil Creek in 1859. The derrick is nearly twice as high as then; the drilling apparatus is much longer and heavier; there are improved implements for getting out the pulverized rock and water, and for fishing broken tools out of a well, and with the heavier apparatus now in use much less time is required to pierce to a given depth. Still the process is the same pounding of a hole through the rock, and the general appearance of a new well just sunk does not differ noticeably from that of a well of twenty years ago. It is in the means for the transportation and storage of the oil that great progress has been made. An admirable system has been developed in recent years, by which the product of widely scattered wells is gathered by small pipes into huge storage tanks, and then forced by powerful engines through larger pipes that run straight over hills and valleys, across forests, farms, and rivers, to the chief marts of refining and shipment. No other important product of industry is handled and transported with such small expenditure of labor and capital, and such rapidity and efficiency. The refineries of Pittsburg, Cleveland, and Buffalo are supplied by pipes from the heart of the producing regions in Pennsylvania, and the enormous tanks grouped on the hill-sides and in the valleys at Olean discharge their contents at Bayonne, on New York Bay, three hundred miles distant. A net-work of pipes covers the whole oil-producing territory, reaching every well, uniting all the isolated districts, and collecting the little streams of oil from twenty thousand different subterranean springs into rivulets and rivers that pulsate in their iron tubes like the arteries in the body of a living creature, and flow with powerful current straight to their appointed outlets.

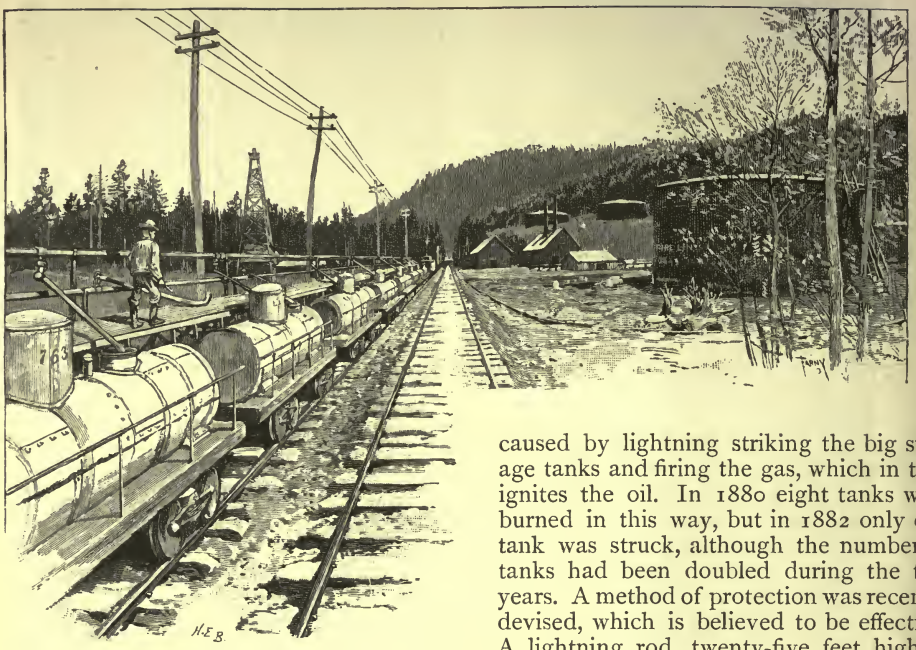
Two pipe-line companies supply the whole oil country with storage and transportation. One of these, the Tidewater Company, taps a portion of the wells in the Bradford field alone, and ends at Tamanend, in Eastern Pennsylvania, where it transfers its oil to tank cars on the Philadelphia and Reading Railway and the Central Railway of New Jersey. It is comparatively a small concern, but is important as the only competitor to its gigantic rival, the United Pipe Lines, a corporation running its mains to every district, large or small, in the oil region, having its termini at the sea-board and at the three principal refining cities of the interior, and possessing a tankage capacity of over thirty millions of barrels. The United Pipe Lines corporation is the great Standard Oil Company under a different name, the controlling interest in the stock of the two concerns being owned by the same men. The United stores and transports; the Standard buys, refines, sells, and exports. This double-headed corporate power is the monarch of the oil trade. Only the producing interest remains in a multitude of hands; all else is virtually concentrated in the grasp of a little group of men who manage the two companies.

Let us look for a moment at the system by which petroleum is handled. It is remarkably simple, inexpensive, and efficient. When the tank at a well is nearly full, notice is sent to the nearest agency of the Pipe Lines. A man comes promptly with a measuring pole and a little book of certificates. He gauges the oil in the tank, unlocks the stop-cock connecting with the outlet pipe, and lets as much oil run out as the well-owners want to dispose of. Then he shuts off the flow, measures what remains in the tank, and makes out a triplicate certificate, showing depth of oil at the beginning and at the end of the run. One he gives to the well manager who has signed with him, one he sends to the central office of the Pipe Lines at Oil City, and one he keeps. A telegram is then sent to the central office, giving notice that so many inches of oil have been run from the tank. Every tank has its number on the books of the company, and its capacity is recorded in inches. On receiving the certificate of the run, the number of barrels and hundredths of a barrel taken from the tank is ascertained by a table, and credit is given to the well for that amount of oil less three per cent., which is deducted for sedi-

A BURNING OIL-TANK. (CAPACITY, 3500 BARRELS.)

ment and evaporation. The account is not only kept in gross with the well, but is divided so that each share-owner, if there be many (and there are usually from three to a dozen), gets his separate credit for the amount of oil he is entitled to from the run. The United Pipe Lines is not only a transportation company, but also a bank of deposit for oil and an insurance company, and it keeps the books of every well it serves.

The oil from the well is now in possession of the Pipe Company, and is in one of its big storage tanks mixed with oil from scores of other wells. There is no separation and no distinction of quality. All crude petroleum, from whatever well or district it comes, is



OIL-SIDING AND PUMPING-STATION. TRANSPORTING OIL FROM THE PIPE-LINES TO THE CARS.

classed together as of uniform value. When a producer sells oil, he gives an order for a transfer to the purchaser of as many barrels from his credit balance as he has disposed of; or, if he wants to use his oil in store as collateral to borrow money upon or convert it into a negotiable certificate, he gets what is called an acceptance, which is virtually a certified check. These acceptances are issued in even amounts of one thousand barrels each. They are passed from hand to hand all over the world, but must, by a rule of the company, be sent in once in six months for renewal, or a double storage charge is made. Frequently they return covered on their backs with indorsements. When the holder of an acceptance or a credit balance wants the oil for use or shipment it is delivered at either of the main shipping points, he paying twenty cents per barrel as the pipage charge, and a storage charge of fifty cents per day per one thousand barrels. Storage for the first twenty days is free, however, to the producer, and a purchaser has ten days' storage without charge.

Insurance is a mutual affair. Losses are assessed on all the oil in the lines and on holders of acceptances and credit balances for oil in store. Last year the assessments amounted to only eight-tenths of one per cent. A loss of less than twenty thousand barrels is considered too small to assess, and is borne by the Pipe Company. Nearly all losses are caused by lightning striking the big storage tanks and firing the gas, which in turn ignites the oil. In 1880 eight tanks were burned in this way, but in 1882 only one tank was struck, although the number of tanks had been doubled during the two years. A method of protection was recently devised, which is believed to be effective. A lightning rod, twenty-five feet high, is attached to four broad bands of iron sheathing, reaching from the apex of the covered tank and out to the sides, and thus, according to the accepted theory, the electricity which the tank accumulates is safely discharged into the air.

The pipe line system was a thing of small beginnings and slow growth. As long ago as 1863 a young Boston attorney, who had established himself on the Tarr farm, one of the first producing districts on Oil Creek, conceived the plan of transporting crude petroleum through tubes, and had some pipe manufactured for the purpose, but never put it down. Two years later the first pipe was laid. It extended from Pithole to the Allegheny River, a distance of about fifteen miles, but the joints were so defective that it was used only a few weeks. It served to show, however, that the general plan of pipe transportation was practicable, and it was not long before a number of pipe companies were formed. Their object was only to take the oil from the wells to the nearest railway line or to the Allegheny River, on which it was then floated down to Pittsburg in tanks upon flat-boats. For a number of years the pipe lines were in bad odor, owing to numerous failures among the companies and to their lack of efficiency. The system gained ground, however, from its evident superiority, and in 1876 the consolidation of a number of lines formed the United Pipe Lines, a corporation which grew in power from year to year, and

finally absorbed all the old concerns. It now owns over three thousand miles of pipes and over five hundred iron tanks, with a storage capacity of from 20,000 to 35,000 barrels each.

A great deal of oil still goes to market by railroad however, not directly from the wells, but from shipping stations to which it is brought by the pipe lines. Tamanend and Williamsport are important shipping points, nearly two hundred miles from the oil fields; Kane, much nearer, is another, and there are numerous points where trains are loaded on the roads penetrating the producing districts. The long trains of tank cars, greasy, dirty, and malodorous, are familiar sights on most of the railways leading to New York, Philadelphia, and Baltimore. The tanks are cylindrical in form, holding about twenty-five thousand gallons each, and surmounted by a "cupola," which gives space for the oil to expand when heated by the sun's rays.

The long pipe lines are: Two from Olean on the northern verge of the great Bradford field to New York Bay, three hundred miles; one from Coal Grove in the Bradford field to Milton on the Philadelphia and Erie and Philadelphia and Reading railroads, about one hundred and fifty miles; one from Rock City in the same field to Buffalo, seventy-eight miles; one from Hilliard's, in the Lower field to Cleveland, one hundred and five miles; one from Carbon Center in the Lower field to Pittsburg, thirty-eight miles (all these belonging to the United Pipe Lines Company), and one from Rixford in the Bradford field to Tamanend on the Reading Railroad, one hundred and seventy miles, belonging to the Tidewater Company. There are also important lines connecting the different fields, so that oil can be transferred from one to another. On the main lines there is on an average a pumping engine every twenty-five miles. The engines may be much nearer together or much further apart, depending on the extent to which gravity can be used as a motive power. Main line pipes are four, five, or six inches in diameter. Through a six-inch pipe twenty thousand barrels a day can be conveyed. When oil is being forced through a pipe there is a constant clicking sound like that made by steam-heating apparatus. The hunter who loses his way in the dense forests which cover mountainous country in the oil regions will hardly go many miles without hearing this sharp, metallic sound; then he has only to follow the pipe to come to a cluster of wells, or a pumping station, or perhaps to a narrow-gauge railway climbing up a frightfully steep grade. The resonant pipe leads him out of the wilderness.

Every new producing district discovered in the oil regions develops one or more new towns. They spring up with marvelous rapidity, and bloom into full-grown municipalities in a few weeks, with stores, hotels, amusement halls, a fire department, and a police force. If the yield from the wells holds out for a year, the rude wooden structures are succeeded by brick blocks and comfortable dwellings; but most of these petroleum settlements never get beyond the shanty stage. Their decline is not so rapid as their rise, but their fortunes steadily fail as the yield of the district decreases. Some of them disappear altogether; others remain, shrunken and dilapidated, as insignificant centers of a little local trade. The magnitude of the producing business as a whole, however, and of the various interests of refining and transporting and of furnishing machinery and supplies dependent upon it, has recently developed a few important and prosperous little cities, whose existence does not hang upon the fate of any one particular district. The chief of these are Oil City, at the junction of Oil Creek with the Allegheny River, in what is known as in the Lower field, and Bradford in the Upper field. Oil City dates back to the first opening of wells on Oil Creek, and is a well-built place of about ten thousand inhabitants, wedged in two narrow valleys, dirty, smoky, and busy,— a railroad center, a large refining point, and the chief market for speculations and actual sales of crude petroleum. The chief offices of the United Pipe Lines and the most important oil exchange in the world are established here. Bradford was a petty country village in 1875, when oil was struck near by; now it rivals Oil City in population, and has a handsome exchange, an opera house, a street railroad, and two daily newspapers. The derricks stand thick among the houses, and dot the sides and crests of the steep wooded hills encircling the town. Railway lines run to every point of the compass, the narrow-gauge roads making no account of mountains, but getting up and over them on grades that would be impracticable to an ordinary train. Titusville, on Oil Creek, once the metropolis of the petroleum country, has lost its importance as a center of oil production and trade, but is the favorite residence town of prosperous brokers and producers, and boasts of its fine business buildings, well shaded streets, and handsome dwellings. It has a population of about five thousand. Warren, an old, quiet, county-seat town, with four thousand inhabitants, on the upper Allegheny, converted into an oil center by the opening of producing districts in its vicinity, is a pretty, homelike place, almost hidden under maple trees, and looking out

GAS WELLS.

from the river bluff on green meadows and the slopes of low mountains covered with hemlock and birch. In the still newer districts of Allegany County, New York (in Pennsylvania the name is spelled Allegheny, and in New York Allegany), the twin towns of Bolivar and Richburg, a mile apart, have together a population of over six thousand, and are equally unattractive, save where some vestiges of the original cross-roads villages remain. In their eager growth, even the homes of the dead have been invaded, and houses have been built in the old burying-grounds over and among the graves. Still less admirable in outward look are the last year's towns of Garfield and Farnsworth, sprawled out over forests and fields in the Cherry Grove district. These raw, rude, dusty, greasy centers of trade and speculation, born in a day of the excitement attending new discoveries of oil, strongly resemble the mining camps of Colorado and Montana. Like these camps, they are full of rough-looking, eager men, energetic and unkempt, bent upon making money by boldness and luck. Drinking-places abound, and the popular form of amusement is the vulgar variety show. There are old and orderly communities close at hand, however, and the laws are enforced without vigilance committees or Judge Lynch's courts. Open gaming is not allowed, and vice fears to flaunt itself in the highways. One does not meet such picturesque characters as are common in the mining districts. There is no element of personal danger, wildness, or remoteness, to attract adventurous spirits. The only peril is of getting "dead broke" in some unfortunate speculation. Telegraphs and railroads run everywhere, so the region is not a refuge, like the far Western Territories, for men who have run away from their creditors, from the sheriff, or from their wives. It looks wild and remote enough among the forests and mountains of northwestern Pennsylvania; but the great cities of Buffalo, Pittsburg, and Cleveland are only a few hours' distance by rail. The oil business is not of a character to attract romantic people. Washing gold from the earth is a dirty business; but the product is the precious, fascinating, yellow metal, while the occupation of boring for petroleum, though more hazardous so far as its chances of profit and loss are concerned than mining, yields only an ill-smelling liquid which sells at eighty or ninety cents a barrel.

Bradford and some of the smaller towns in the oil regions are lighted with natural gas

from wells which fail to yield oil, but discharge a steady flow of gas, not equal in illuminating power to good artificial gas, but so cheap that it is burned lavishly. To a great extent it is used as fuel, a supply pipe run into an ordinary coal stove being the only apparatus required. Were it not for a slight odor, it would be an ideal fuel. You have only to turn a stop-cock to regulate the heat, and there are, of course, no ashes or cinders or coal dust. Huge blazing torches, lighting up the woods for rods around and illuminating some lonely cabin or derrick with a theatrical stage glare, make weird night effects that startle the traveler, new to the oil country, who first traverses the great forests of the Bradford district.

A curious feature of the new settlements in the Cherry Grove district is the great number of shanties and sheds bearing the sign "Bottling Works." There are no saloons proper; but everywhere, on the dusty highways, at cross-roads, and in the woods, where there is a group of wells, this singular legend, "Bottling Works," greets the eye. The equipment of one of these establishments consists of two or three kegs and a dozen bottles of beer. No glasses are kept on the bar, and there are no seats for tired and thirsty wayfarers.

I stopped at one of these places and asked the proprietor, a decent looking fellow, to explain why he entitled his bar a bottling works instead of a beer saloon. He replied that the Pennsylvania license law empowered the courts to grant licenses. When oil was struck in Cherry Grove, the court in Warren county was not in session and would not sit for six months. Meanwhile, what should the thirsty multitude that rushed to the new field do for something to drink? Somebody remembered that there was a law authorizing every person who paid fifty dollars to the county treasurer to bottle ale or beer, not to be sold by the glass, and not to be drunk on the premises. The bottling works took shelter under this law. "You notice this platform in front of my house," continued the beer-seller. "Well, it's not on my premises. The house stands right on the line of the public highway. When I sell a customer a bottle of beer, he don't drink it on the premises; he stands right here on the porch, and the porch is in the highway."

Just then a red-faced man, whose clothes were redolent of petroleum, called for a bottle, swallowed the beer, put down ten cents, and went his way. "Don't you give them glasses to drink from?" I asked. "No; that would be selling by the glass. I got some tin cups and used them for awhile, but concluded I might get into trouble. The court might hold the tin-cup dodge as an evasion of the law. As long as they drink the beer from the bottle, the law can't touch me." "Then the effect of the liquor legislation is that a man who would ordinarily be satisfied with a mug of beer must buy a whole bottle?" "That's what it comes to, my friend."

The beer-seller went on to say that he voted for prohibitory laws every time. The more stringent a law was the better it suited him. "You see," he explained, "'taint every man that's got sand enough in him to violate such a law, and those who have can make lots of money. I always set up in a place where there's some sort of a strong local option or license law to stop the sale of drink. Men will have liquor, and when they are obliged to get it on the sly they'll pay a good price for it. I was two years in the town of Sharon, where they had local option. Even the druggists dursn't sell liquor. Well, I took a room, sub-leased it to a man to store brooms, so it didn't appear to be occupied by me, boarded up the window, made a little door in one pane, got myself a false face, and laid in a stock of whisky and pint bottles. When a customer rapped on the window I put on my mask, handed him out a pint bottle of whisky, and took in a dollar. Nobody could swear he got his liquor from me. I often made over a hundred dollars a day. The liquor cost me a dollar and a quarter a gallon, and I sold it for a dollar a pint. Finally they got a case against me in court. Some fellow swore he bought whisky from me. I got the case postponed six months, and went on selling. Then the jury disagreed. So I got six months' more time. At last I only had to pay a fine of fifty dollars."

Across the road from this man's bottling works was a neat country school-house, and near by, at a cross-roads, a big sign announced that the place was Vandergrift City. The brick buildings of a huge pumping engine sending a stream of oil off toward the seaboard and panting at its work, four huge tanks, and half-a-dozen houses made up the city. The beer-seller said he "located" there because the school was so convenient for his two little children.

The oil exchanges at Bradford and Oil City are noisy and animated places during business hours, and at other times they serve as club-rooms for the members. There are pleasant reading-rooms attached, where the daily papers from the large cities are received; and there are comfortable sofas and chairs, inviting to lounging and chat. In the Bradford Exchange there is also a music room with a piano, where of evenings the tuneful brokers sing popular ballads. The buying and selling

at these places is carried on with the clamor and gesticulation which, for some mysterious reason, is a feature of stock and produce exchanges the world over. Why men, who in all the other affairs of life are quiet and dignified, should think it necessary, when arranging a commercial transaction in stocks or grain or oil, to shout and shriek and wave their arms and shake their fists like raving lunatics, is a problem in human nature which remains unexplained. On a day when prices fluctuate, and the bulls and bears are peculiarly active and excited, the roar and racket from one of these oil exchanges can be heard a block distant. By far the greater part of the transactions are speculative, the oil nominally sold never changing hands at all, and never, in fact, being in the possession of either seller or buyer. The average daily sales at the Oil City Exchange in September last exceeded six million barrels; those at the Bradford Exchange exceeded two millions. I have not the figures for the other exchanges at Titusville, Pittsburg, and New York, but it is probably a moderate estimate to say that the grand total of daily transactions the year round averages ten million barrels, whereas the total production of the whole petroleum field is only about eighty thousand barrels per day. Petroleum is a peculiarly fascinating article for speculative operations, because of the heavy and frequent fluctuations in its value. Within the past year its price has ranged from forty-nine cents to one dollar per barrel. A variation of ten cents in a single day is no uncommon thing. The mere rumor of a successful well in a new district will sometimes send the price down five cents. No other great natural product is subject to such changes in value. The wheat crop and the cotton crop can be estimated months in advance, and one year's scant yield is compensated by the surplus of the next. The annual output of coal varies only with the demand, and there is no fear of the supply becoming exhausted. But with petroleum the case is different. No one can tell how long a well or a large group of wells will hold out. No one knows what new and untapped fountains the earth still conceals. The future of the oil business is not clear from week to week, much less from year to year. Perhaps the supply will so far fail as to send the price up to five dollars; perhaps new flowing wells will so increase the production as to make the oil worth little more than the cost of transportation from the tanks. The reader will see what a field these conditions afford for bold and reckless speculation and for large profits and losses.

The business of refining petroleum grew very naturally out of that of distilling kerosene from bituminous coal, which had developed into an important industry in the United States and Europe during the decade prior to the oil discoveries in Pennsylvania. The establishments using coal as a raw material from which to obtain kerosene substituted petroleum as soon as it became the cheaper of the two substances. The name coal oil was readily transferred to the new illuminating fluid obtained from the earth, and it is still widely known by that name or by the Greek appellation kerosene, originally taken as a trademark by one of the early distillers of cannel coal. It is an interesting fact, showing how persistently special industries cling to the localities of their first choice, that the great petroleum refineries of Hunter's Point, Long Island, whose odors are a serious offense to the noses of the inhabitants of the upper East River front wards of New York city, are the successors of one of the earliest kerosene factories in the United States, which was established on Newtown Creek in 1854.

The chief seats of the refining industry in this country are Cleveland, Buffalo, Pittsburg, Oil City, and Hunter's Point (now called Long Island City). With the exception of Oil City, all these places are situated at a considerable distance from the oil fields, and were chosen for convenience in domestic and foreign shipment of the refined product rather than for nearness to the supply of the crude material. The pipe system, however, brings them practically close to the wells. Most of the exports of petroleum go abroad in the shape of refined oil. There are, however, refineries in Europe, and notably in France, which buy large quantities of crude petroleum in America.

No fewer than ten substances are obtained from petroleum by the refining process besides the beautiful aniline dyes, which are extracted from the residuum by chemical processes. These substances, named in the order of their specific gravity, which varies from 625 to 848, are as follows: 1st, rhigolene, the most volatile product of first distillation used to produce local anæsthesia; 2d, gasolene, used in artificial gas machines; 3d, 4th, and 5th, three grades of naphtha, used for mixing paints and varnishes and dissolving resin; 6th, kerosene, the common illuminating oil of commerce; 7th, mineral sperm oil, a heavier oil for burning in lamps, which does not take fire under a temperature of three hundred degrees, and is employed on steamers and railroads; 8th, a lubricating oil for machinery; 9th, paraffine, from which candles are made; and 10th, paraffine wax. Then there is the residuum, usually called

coal tar, which has a variety of uses. In most refineries the products are only naphtha, kerosene, and residuum. The refining process removes the coloring matter and the gummy substances which would clog the lamp-wick and separates the naphtha, which makes the oil dangerously inflammable. The quality of refined petroleum depends on the care and honesty exercised in the distilling process. Good oil is not dangerous, as many people suppose all kerosene must be. Only the poorer grades are liable to take fire. A very simple test can be applied by any housekeeper to ascertain whether the fluid is safe or not. Partly fill a cup with water warmed to one hundred and twenty degrees Fahrenheit; turn in a little oil, stir the mixture, and apply a lighted match to the surface. If it takes fire, the oil is unfit for use; if not, it is entirely safe.

What is the future of the petroleum business? With a productive territory virtually confined to a few small strips and spots in six counties in Western Pennsylvania and New York, and an inexorable law of rapid exhaustion applying to all wells, the time would seem to be close at hand when this great blessing, the cheap light of the whole civilized world, would fail. Still, the history of the business in the short period since it began has been one of constant expansion. New fields have invariably been discovered when the yield of the old ones began to decline. Oil men have confidence that there is plenty of undiscovered territory yet to be found. Providence, they say, would not bestow so great a gift upon mankind to withdraw it when its use had become universal and the need of the human race for its benefits the greatest. Scientists may say that this view is based on an optimistic or pietistic theory of the universe that will not stand investigation. So far as the great stores of fuel and light, the coal and the petroleum, are concerned, it has, however, held good thus far. They have not failed. If the oil of the rock is destined to run dry, the chemists will perhaps be ready, by the time it is exhausted, to produce a cheap illuminator from water.

E. V. Smalley.

FAREWELL TO SALVINI.*

ALTHOUGH a curtain of the salt sea-mist
May fall between the actor and our eyes—
Although he change, for dear and softer skies,
These that the Spring has yet but coyly kist—
Although the voice to which we loved to list
Fail ere the thunder of our plaudits dies—
Although he part from us in gracious wise,
With grateful Memory left his eulogist—
His best is with us still.
His perfect art
Has held us 'twixt a heart-throb and a tear—
Cheating our souls to passionate belief:
And in his greatness we have now some part—
We have been courtiers of the crownless Lear,
And partners in Othello's mighty grief.

H. C. Bunner.

NIGHTS WITH UNCLE REMUS.*

BY JOEL CHANDLER HARRIS,

Author of "Uncle Remus, His Songs and Sayings," "At Teague Poteet's," etc.

[To GIVE a cue to the imagination of the reader, it may be necessary to state that the stories related in this paper are supposed to be told to a little boy on a Southern plantation, before the war, by an old family servant.]

I.

THE MOON IN THE MILL POND.

ONE night when the little boy made his usual visit to Uncle Remus, he found the old man sitting up in his chair fast asleep. The child said nothing. He was prepared to exercise a good deal of patience upon occasion, and the occasion was when he wanted to hear a story. But in making himself comfortable, he aroused Uncle Remus from his nap.

"I let you know, honey," said the old man, adjusting his spectacles, and laughing rather sheepishly, "I let you know, honey, w'en I git's my head r'ar'd back dat away, en my eyeleds shot, en my mouf open, en my chin p'intin' at de rafters, den dey's some mighty quare gwines on in my min'. Dey is dat, des ez sho ez youer settin' dar. W'en I fuss year you comin' down de paf," Uncle Remus continued, rubbing his beard thoughtfully, "I 'uz sorter fear'd you mought 'spicion dat I done gone off on my journeys fer ter see old man Nod."

This was accompanied by a glance of inquiry, to which the little boy thought it best to respond.

"Well, Uncle Remus," he said, "I did think I heard you snoring when I came in."

"Now you see dat!" exclaimed Uncle Remus in a tone of grieved astonishment; "you see dat! Man can't lean hisse'f 'pun his 'membunce, 'ceppin' dey's somé un fer ter come high-primin' roun' en 'lowin' dat he done gone ter sleep. *Shoo!* W'en you stept in dat do' dar I 'uz right in 'mungs some mighty quare notions—mighty quare notions. Dey aint no two ways; ef I 'uz ter up en let on 'bout all de notions w'at I gits in mungs, folks 'ud hatter come en kyar me off ter de place whar dey puts 'stracted people."

"Atter I sop up my supper," Uncle Remus went on, "I tuck'n year some flutterments up dar 'mungs de rafters, en I look up, en dar wuz a bat sailin' 'roun'. 'Roun' en 'roun', en 'roun' she go—und' de rafters, 'bove de rafters—en ez she sail she make noise lak she grittin' 'er toofies. Now, w'at dat bat atter, I be bless ef I kin tell you, but dar she wuz; 'roun' en 'roun', over en under. I ax 'er w'at do she want up dar, but she aint got no time fer ter tell; 'roun' en 'roun', en over en under. En bimeby, out she flip, en I boun' she grittin' 'er toofies en gwine 'roun' en 'roun' out dar, en dodgin' en flippin' des lak de elements wuz full er rafters en cobwebs.

"W'en she flip out I le'nt my hèad back, I did, en 'twa'nt no time 'fo' I git mix up wid my notions. Dat bat wings so limber en 'er will so good dat she done done 'er day's work dar 'fo' you could 'er run ter de big house en back. De bat put me in min' er folks," continued Uncle Remus, settling himself back in his chair, "en folks put me in min' er de creeturs."

Immediately the little boy was all attention.

"Dey wuz times," said the old man, with something like a sigh, "w'en de creeturs 'ud segashuate tergedder des like dey aint had no fallin' out. Dem wuz de times w'en ole Brer Rabbit 'ud 'ten' lak he gwine quit he 'havishness, en dey'd all go 'roun' same lak dey b'long ter de same fambly connexion.

"One time atter dey bin gwine in cohoots dis away, Brer Rabbit 'gun ter feel his fat, he did, en dis make 'im git projecky terreckly. De mo' peace w'at dey had, de mo' wuss Brer Rabbit feel, twel bimeby he git restless in de min'. W'en de sun shine he'd go en lay off in de grass en kick at de gnats; he nibble at de mullen stalk en waller in de san'. One night atter supper, w'iles he 'uz romancin' 'roun', he run up wid ole Brer Tarrypin, en atter dey shuck han's dey sot down on de side er de road en run on 'bout ole times. Dey talk en dey talk, dey did, en bimeby Brer Rabbit say it done come ter dat pass whar he bleedz ter have some fun, en Brer Tarrypin 'low dat Brer Rabbit des de ve'y man he bin lookin' fer.

"'Well, den,' says Brer Rabbit, sezee, 'we'll

des put Brer Fox, en Brer Wolf, en Brer B'ar on notice, en ter-morrer night we'll meet down by de mill-pon' en have a little fishin' frolic. I'll do de talkin',' says Brer Rabbit, sezee, 'en you kin set back en say *yea*,' sezee.

"Brer Tarrypin laugh.

"'Ef I aint dar,' sezee, 'den you may know de grasshopper done fly 'way wid me,' sezee.

"'En you neenter bring no fiddle, n'er,' sez Brer Rabbit, sezee, 'kaze dey aint gwineter be no dancin' dar,' sezee.

"Wid dat," continued Uncle Remus, "Brer Rabbit put out fer home, en went ter bed, en Brer Tarrypin bruise 'roun' en make his way tords de place so he kin be dar 'gin 'de 'p'inted time.

"Nex' day Brer Rabbit sont wud ter de yuther creeturs, en dey all make great 'miration, kaze dey aint think 'bout dis deyse'f. Brer Fox, he 'low, he did, dat he gwine atter Miss Meadows en Miss Motts, en de yuther gals.

"Sho nuff, w'en de time come dey wuz all dar. Brer B'ar, he fotch a hook en line; Brer Wolf, he fotch a hook en line; Brer Fox, he fotch a dip-net, en Brer Tarrypin, not ter be out-done, he fotch de bait."

"What did Miss Meadows and Miss Motts bring?" the little boy asked.

Uncle Remus dropped his head slightly to one side, and looked over his spectacles at the little boy.

"Miss Meadows en Miss Motts," he continued, "dey tuck'n stan' way back fum de aidge er de pon' en squeal eve'y time Brer Tarrypin shuck de box er bait at um. Brer B'ar 'low he gwine ter fish fer mud-cats; Brer Wolf 'low he gwine ter fish fer hornyheads; Brer Fox 'low he gwine ter fish fer peerch fer de ladies; Brer Tarrypin 'low he gwine ter fish fer minners, en Brer Rabbit wink at Brer Tarrypin' en 'low he gwine ter fish fer suckers.

"Dey all git ready, dey did, en Brer Rabbit march up ter de pon' en make fer ter th'ow he hook in de water, but des 'bout dat time, hit seem lak he see sump'n. De t'er creeturs, dey stop en watch his motions. Brer Rabbit, he drap he pole, he did, en he stan' dar scratchin' he head en lookin' down in de water.

"De gals dey 'gun ter git oneasy w'en dey see dis, en Miss Meadows, she up en holler out, she did:

"'Law, Brer Rabbit, w'at de name er goodness de marter in dar?'

"Brer Rabbit scratch he head en look in de water. Miss Motts, she hilt up 'er petticoats, she did, en 'low she monstus fear'd er snakes. Brer Rabbit keep on scratchin' en lookin'.

"Bimeby he fetch a long bref, he did, en he 'low:

"'Ladies en gentermuns all, we des might ez well make tracks fum dish yer place, kaze dey aint no fishin' in dat pon' for none er dis crowd.'

"Wid dat, Brer Tarrypin, he scramble up ter de aidge en look over, en shake he head, en 'low:

"'Tooby sho'—tooby sho! Tut-tut-tut!' en den he crawl back, he did, en do lak he wukkin' he min'.

"'Don't be skeert, ladies, kaze we er boun' ter take keer un you, let come w'at will, let go w'at mus',' sez Brer Rabbit, sezee. 'Accidents got ter happen unter we all, des same ez dey is unter yuther folks; en dey aint nothin' much de marter, 'ceppin' dat de Moon done drap in de water. Ef you don't b'leeve me you kin look fer yo'se'f', sezee.

"Wid dat dey all went ter de bank en lookt in; en, sho nuff, dar lay de moon, a-swingin' an' a-swayin' at de bottom er de pon'."

The little boy laughed. He had often seen the reflection of the sky in shallow pools of water, and the startling depths that seemed to lie at his feet had caused him to draw back with a shudder.

"Brer Fox, he look in, he did, en he 'low, 'Well, well, well.' Brer Wolf, he look in, en he 'low, 'Mighty bad, mighty bad!' Brer B'ar, he look in, en he 'low, 'Tum, tum, tum!' De ladies dey look in, en Miss Meadows, she squall out, 'Aint dat too much?' Brer Rabbit, he look in ag'in, en he up en 'low, he did:

"'Ladies en gentermuns, you all kin hum en haw, but less'n we gits dat Moon out er de pon', dey aint no fish kin be ketch 'roun' yer dis night; en ef you'll ax Brer Tarrypin, he'll tell you de same.'

"Den dey ax how kin dey git de Moon out er dar, en Brer Tarrypin 'low dey better lef' dat wid Brer Rabbit. Brer Rabbit he shot he eyes, he did, en make lak he wukkin he min'. Bimeby, he up'n 'low:

"'De nighes' way out'n dish yer diffikil is fer ter sen' roun' yer too ole Mr. Mud-Turkle en borry his sane, en drag dat Moon up fum dar,' sezee.

"'I 'clar' ter gracious I mighty glad you mention dat,' says Brer Tarrypin, sezee. 'Mr. Mud-Turkle is setch clos't kin ter me dat I calls 'im Unk Muck, en I lay ef you sen' dar atter dat sane you wont fine Unk Muck so mighty disaccomerdatin'.'

"Well," continued Uncle Remus, after one of his tantalizing pauses, "dey sont atter de sane, en wiles Brer Rabbit wuz gone, Brer Tarrypin, he 'low dat he done year tell time

en time ag'in dat dem w'at fine de Moon in de water en fetch 'im out, lakwise dey ull fetch out a pot er money. Dis make Brer Fox, en Brer Wolf, en Brer B'ar feel mighty good, en dey 'low, dey did, dat long ez Brer Rabbit been so good ez ter run atter de sane, dey ull do de sanein'.

"Time Brer Rabbit git back, he see how de lan' lay, en he make lak he wanter go in atter de Moon. He pull off his coat, en he 'uz fixin' fer ter shuck his wescut, but de yuther creeturs dey 'low dey wan't gwine ter let dry-foot man lak Brer Rabbit go in de water. So Brer Fox, he tuck holt er one staff er de sane, Brer Wolf he tuck holt er de yuther staff, en Brer B'ar he wade 'long behime fer ter lif' de sane 'cross logs en snags.

"Dey make one haul—no Moon; n'er haul, no Moon; n'er haul, no Moon. Den bimeby, dey git out furder fum de bank. Water run in Brer Fox year, he shake he head; water run in Brer Wolf year, he shake he head; water run in Brer B'ar year, he shake he head. En de fus news you know, w'iles dey wuz a-shakin', dey come to whar de bottom shelfed off. Brer Fox he step off en duck hisse'f; den Brer Wolf duck hisse'f; en Brer B'ar he make a splunge en duck hisse'f; en, bless gracious, dey kick en splatter twel it look lak dey 'uz gwine ter slosh all de water outer de mill pon'.

"W'en dey come out, de gals 'uz all a-snickerin' en a-gigglin', en well dey mought, 'kase, go whar you would, dey want no wuss lookin' creeturs dan dem; en Brer Rabbit, he holler, sezee:

"'I speck you all, gents, better go home en git some dry duds, en n'er time we'ull be in better luck,' sezee. 'I year talk dat de Moon'll bite at a hook ef you take fools fer baits, en I lay dat's de onliest way fer ter ketch 'er,' sezee.

"Brer Fox en Brer Wolf en Brer B'ar went drippin' off, en Brer Rabbit en Brer Tarrypin dey went home wid de gals."

II.

BROTHER RABBIT TAKES SOME EXERCISE.

ONE night while the little boy was sitting in Uncle Remus's cabin, waiting for the old man to finish his hoecake, and refresh his memory as to the further adventures of Brother Rabbit, his friends and his enemies, something dropped upon the top of the house with a noise like the crack of a pistol. The little boy jumped, but Uncle Remus looked up and exclaimed, "Ah-yi!" in a tone of triumph.

"What was that, Uncle Remus?" the child asked, after waiting a moment to see what else would happen.

"News fum Jack Fros', honey. W'en dat hick'y-nut tree out dar year 'im comin' she 'gins ter drap w'at she got. I mighty glad," he continued, scraping the burnt crust from his hoe-cake with an old case-knife, "I mighty glad hick'y-nuts aint big en heavey ez grine-stones."

He waited a moment to see what effect this queer statement would have on the child.

"Yasser, I mighty glad—dat I is. 'Kase ef hick'y-nuts 'uz big ez grine-stones dish yer ole callyboose 'ud be a leakin' long 'fo' Chris'-mus."

Just then another hickory-nut dropped upon the roof, and the little boy jumped again. This seemed to amuse Uncle Remus, and he laughed until he was near to choking himself with his smoking hoe-cake.

"You does des 'zackly lak ole Brer Rabbit done, I 'clar' to gracious ef you don't!" the old man cried, as soon as he could get his breath; "des zackly fer de worl'."

The child was immensely flattered, and at once he wanted to know how Brother Rabbit did. Uncle Remus was in such good humor that he needed no coaxing. He pushed his spectacles back on his forehead, wiped his mouth on his sleeve, and began:

"Hit come 'bout dat soon one mawnin' todes de fall er de year, Brer Rabbit wuz stirrin' 'roun' in de woods atter some bergamot fer ter make 'im some ha'r-grease. De win' blow so col' dat it make 'im feel right frisky, en eve'y time he year de bushes rattle he make lak he skeerd. He 'uz gwine on dis away, hoppity-skippity, w'en bimeby he year Mr. Man cuttin' on a tree way off in de woods. He fotch up, Brer Rabbit did, en lissen fus wid one year en den wid de yuther.

"Man, he cut, en cut, en Brer Rabbit, he lissen en lissen. Bimeby, w'iles all dis gwine on, down come de tree—*kubber-lang-bang-blam!* Brer Rabbit, he tuck'n jump des lak you jump, en let 'lone dat, he make a break, he did, en he leaped out fum dar lak de dogs wuz atter 'im."

"Was he scared, Uncle Remus?" asked the little boy.

"Skeerd! Who? *Him?* Shoo! don't you fret yo'se'f 'bout Brer Rabbit, honey. In dem days dey want nothin' gwine dat kin skeer Brer Rabbit. Tooby sho', he tuck keer hisse'f, en ef you know de man w'at 'fuse ter take keer hisse'f, I lak mighty well ef you p'int 'im out. Deed'n dat I would!"

Uncle Remus seemed to boil over with argumentative indignation.

"Well, den," he continued, "Brer Rabbit run twel he git sorter het up like, en des 'bout de time he makin' ready fer ter squot en ketch he win', who should he meet but Brer

Coon gwine home atter settin' up wid ole Brer Bull-Frog. Brer Coon see 'im runnin', en he hail 'im:

"'W'at yo' hurry, Brer Rabbit?'

"'Aint got time ter tarry!'

"'Folks sick?'

"'No, my Lord! Aint got time ter tarry!'

"'Tryin' yo' soopleness?'

"'No, my Lord! Aint got time ter tarry!'

"'Do pray, Brer Rabbit, tell me de news!'

"'Mighty big fuss back yan in de woods. Aint got time ter tarry!'

"Dis make Brer Coon feel mighty skittish, 'kaze he fur ways fum home, en he des lipt out, he did, en went a b'ilin' thoo de woods. Brer Coon aint gone fur twel he meet Brer Fox.

"'Hey, Brer Coon, whar you gwine?'

"'Aint got time ter tarry!'

"'Gwine at' de doctor?'

"'No, my Lord! Aint got time ter tarry!'

"'Do pray, Brer Coon, tell me de news.'

"'Mighty quare racket back dar in de woods! Aint got time ter tarry!'

"Wid dat, Brer Fox leaped out, he did, en fa'rly split de win'. He aint gone fur twel he meet Brer Wolf.

"'Hey, Brer Fox! Stop en res' yo'se'f!'

"'Aint got time ter tarry!'

"'Who bin want de doctor?'

"'No'ne, my Lord! Aint got time ter tarry!'

"'Do pray, Brer Fox, good er bad, tell me de news!'

"'Mighty kuse fuss back dar in de woods! Aint got time ter tarry!'

"Wid dat, Brer Wolf, shuck hisse'f loose fum de face er de yeth, en he aint git fur twel he meet Brer B'ar. Brer B'ar he ax, en Brer Wolf make ans'er, en bimeby Brer B'ar he fotch a snort en run'd off; en, bless gracious! twant long 'fo' de las' one er de creeturs wuz a skaddlin' thoo de woods lak de Ole Boy was atter um—en all 'kaze Brer Rabbit year Mr. Man cut tree down.

"Dey run'd en dey run'd," Uncle Remus went on, "twel dey come ter Brer Tarrypin house, en dey sorter slack up 'kaze dey done mighty nigh los' der win'. Brer Tarrypin, he up'n ax um wharbouts dey gwine, en dey 'low dey wuz a monstus tarryfyin' racket back dar in de woods. Brer Tarrypin, he ax w'at she soun' lak. One say he dunno, n'er say he dunno, den dey all say dey dunno. Den Brer Tarrypin, he up'n ax who year dis monstus racket. One say he dunno, n'er say he dunno, den dey all say dey dunno. Dis make ole Brer Tarrypin laff 'way down in he insides, en he up'n say, sezee:

"'You all kin run 'long ef you feel skittish,' sezee. 'Atter I cook my brekkus en wash up de dishes, ef I gits win' er any 'spishus racket maybe I mought take down my pairsol en foller long atter you,' sezee.

"W'en de creeturs come ter make inquirements 'mungs one er n'er 'bout who start de news, hit went right spang back ter Brer Rabbit, but, lo en beholes! Brer Rabbit aint dar, en it tu'n out dat Brer Coon is de man w'at seed 'im las'. Den dey got ter layin' de blame un it on one er n'er, en little mo' en dey'd er fit dar scan'lous, but ole Brer Tarrypin, he up'n 'low dat ef dey want ter git de straight un it, dey better go see Brer Rabbit.

"All de creeturs wuz 'gree'ble, en dey put out ter Brer Rabbit house. W'en dey git dar, Brer Rabbit wuz a-settin' cross-legged in de front po'ch winkin' at de sun. Brer B'ar, he speak up:

"'W'at make you fool me, Brer Rabbit?'

"'Fool who, Brer B'ar?'

"'Me, Brer Rabbit, dat's who.'

"'Dish yer de fus' time I seed you dis day, Brer B'ar, en you er mo' dan welcome ter dat.'

"Dey all ax 'im en git de same ans'er, en den Brer Coon put in:

"'W'at make you fool me, Brer Rabbit?'

"'How I fool you, Brer Coon?'

"'You make lak dey waz a big racket, Brer Rabbit.'

"'Dey sholy wuz a big racket, Brer Coon.'

"'W'at kinder racket, Brer Rabbit?'

"'*Ah-yi!* You oughter ax me dat fus', Brer Coon.'

"'I axes you now, Brer Rabbit.'

"'Mr. Man cut tree down, Brer Coon.'

"Co'se dis make Brer Coon feel like a nat'al-born slink, en 'twa'n't long 'fo' all de creeturs make der bow ter Brer Rabbit en mozey off home."

"Brother Rabbit had the best of it all along," said the little boy, after waiting to see whether there was a sequel to the story.

"Oh, he did dat away!" exclaimed Uncle Remus. "Brer Rabbit was a mighty man in dem days."

III.

WHY BROTHER BEAR HAS NO TAIL.

"I 'CLAR' ter gracious, honey," Uncle Remus exclaimed one night, as the little boy ran in, "you sholy aint chaw'd yo' vittles. Hit aint bin no time, skacely, sence de supper-bell rung, en ef you go on dis away, you'll des nat'ally pe'sh yo'se'f out."

"Oh, I wasn't hungry," said the little boy. "I had something before supper, and I wasn't hungry anyway."

The old man looked keenly at the child, and presently he said:

"De ins en de outs er dat kinder talk all come ter de same p'int in my min'. Youer bin a-cuttin' up at de table, en Mars. John, he 'tuck'n sont you 'way fum dar, en w'iles he think youer off some'rs a-snifflin' en a-feelin' bad, yer you is a-high-primin' 'roun' des lak you done had mo' supper dan de king er Philanders."

Before the little boy could inquire about the king of Philanders he heard his father calling him. He started to go out, but Uncle Remus motioned him back.

"Des set right whar you is, honey—des set right still."

Then Uncle Remus went to the door and answered for the child; and a very queer answer it was—one that could be heard half over the plantation:

"Mars. John, I wish you en Miss Sally be so good ez ter let dat chile 'lone. He down yer cryin' he eyes out, en he aint bodderin' 'long er nobody in de roun' worl'."

Uncle Remus stood in the door a moment to see what the reply would be, but he heard none. Thereupon he continued, in the same loud tone:

"I aint bin use ter no sich gwines on in Ole Miss time, en I aint gwine git use ter it now. Dat I aint."

Presently Tildy, the house-girl, carried the little boy his supper, and the girl was no sooner out of hearing than the child swapped it with Uncle Remus for a roasted yam, and the enjoyment of both seemed to be complete.

"Uncle Remus," said the little boy, after a while, "you know I wasn't crying just now."

"Dat's so, honey," the old man replied, "but 'twouldn't er bin long 'fo' you would er bin, kaze Mars. John bawl out lak a man w'at got a strop in he han', so w'at de diffunce?"

When they had finished eating, Uncle Remus busied himself in cutting and trimming some sole-leather for future use. His knife was so keen, and the leather fell away from it so smoothly and easily, that the little boy wanted to trim some himself. But to this Uncle Remus would not listen.

"'Taint on'y chilluns w'at got de consate er doin' eve'ything dey see yuther folks do. Hit's grown folks w'at oughter know better," said the old man. "Dat's des de way Brer B'ar git his tail broke off smick-smack-smoove, en down ter dis day he de funniest-lookin' creetur w'at wobble on top er dry groun'."

Instantly the little boy forgot all about Uncle Remus's sharp knife.

"Hit seem lak dat in dem days Brer Rabbit en Brer Tarrypin done gone in kerhoots fer ter out-do de t'er creeturs. One time Brer Rabbit tuck'n make a call on Brer Tarrypin, but w'en he git ter Brer Tarrypin house, he year talk fum Miss Tarrypin dat her ole man done gone fer ter spen' de day wid Mr. Mud-Turkle, w'ich dey wuz blood kin. Brer Rabbit he put out atter Brer Tarrypin, en w'en he got ter Mr. Mud-Turkle house, dey all sot up, dey did, en tole tales, en den w'en twelf er'clock come dey had crawfish fer dinner, en dey 'joy deyse'f right erlong. Atter dinner dey went down ter Mr. Mud-Turkle mill-pon', en w'en dey git dar, Mr. Mud-Turkle en Brer Tarrypin dey 'muse deyse'f, dey did, wid slidin' fum de top uv a big slantin' rock down inter de water.

"I speck you moughter seen rocks in de water, 'fo' now, whar dey git green en slippy," said Uncle Remus.

The little boy had not only seen them, but had found them to be very dangerous to walk upon, and the old man continued:

"Well, den, dish yer rock wuz mighty slick en mighty slantin'. Mr. Mud-Turkle, he'd crawl ter de top, en tu'n loose, en go a-sailin' down inter de water—*kersplash!* Ole Brer Tarrypin, he'd foller atter, en slide down inter de water—*kersplash!* Ole Brer Rabbit, he sot off, he did, en praise um up.

"W'iles dey wuz a-gwine on dis away, a-havin' der fun, en 'joyin' deyse'f, yer come ole Brer B'ar. He year um 'laffin' en holl'in', en he hail 'um.

"'Heyo, folks! W'at all dis? Ef my eye aint 'ceive me, dish yer's Brer Rabbit, en Brer Tarrypin, en old Unk' Tommy Mud-Turkle,' sez Brer B'ar, sezee.

"'De same,' sez Brer Rabbit, sezee, 'en yer we is 'joyin' de day dat passes des lak dey wan't no hard times.'

"'Well, well, well!' sez ole Brer B'ar, sezee, 'a-slippin' en a-slidin' en makin' free! En w'at de matter wid Brer Rabbit dat he aint j'inin' in?' sezee.

"Ole Brer Rabbit he wink at Brer Tarrypin, en Brer Tarrypin he hunch Mr. Mud-Turkle, en den Brer Rabbit he up'n 'low, he did:

"'My goodness, Brer B'ar! you can't 'speck a man fer ter slip en slide de whole blessid day, kin you? I done had my fun, en now I'm a-settin' out yer lettin' my cloze dry. Hit's tu'n en tu'n about wid me en deze gents w'en dey's any fun gwine on,' sezee.

"'Maybe Brer B'ar might jine in wid us,' sez Brer Tarrypin, sezee.

"Brer Rabbit he des holler en laff.

"'Shoo!' sezee, 'Brer B'ar foot too big en he tail too long fer ter slide down dat rock,' sezee.

"Dis kinder put Brer B'ar on he mettle, en he up'n 'spon', he did:

"'Maybe dey is, en maybe dey aint, yit I aint afeard ter try.'

"Wid dat, de yuthers tuck'n make way fer 'im, en ole Brer B'ar he git up on de rock, he did, en squat down on he hunkers, en quile he tail und' 'im, en start down. Fus' he go sorter slow, en he grin lak he feel good; den he go sorter peart, en he grin lak he feel bad; den he go mo' pearter, en he grin lak he skeerd; den he strack de slick part, en, gentermens! he swaller de grin en fetch a howl dat moughter bin yeard a mile, en he hit de water lak a chimbly a-fallin'.

"You kin gimme denial," Uncle Remus continued after a little pause, "but des ez sho' ez you er settin' dar, w'en Brer B'ar slick'd up en flew down dat rock, he break off he tail right smick-smack-smoove, en mo'n dat, w'en he make his disappear'nce up de big road, Brer Rabbit holler out:

"'Brer B'ar!—Oh, Brer B'ar! I year tell dat flax-seed poultices is mighty good fer so' places!'

"Yit Brer B'ar aint look back."

IV.

HOW BROTHER RABBIT FRIGHTENED HIS NEIGHBORS.

WHEN Uncle Remus was in a good humor he turned the most trifling incidents into excuses for amusing the little boy with his stories. One night, while he was hunting for a piece of candle on the shelf that took the place of a mantel over the fire-place, he knocked down a tin plate. It fell upon the hearth with a tremendous clatter.

"Dar now!" exclaimed Uncle Remus. "Hit's a blessin' dat dat ar platter is got mo' backbone dan de common run er crockery, 'kaze 'twould er bin bust all ter flinderations long time ago. Dat ar platter is got dents on it w'at Miss Sally put dar w'en she 'uz a little bit er gal. Yit dar 'tis, en right dis minnit hit'll hol' mo' vittles dan w'at I got ter put in it.

"I lay," the old man continued, leaning his hand against the chimney and gazing at the little boy reflectively, "I lay ef de creeturs had a bin yer w'iles all dat clatterment gwine on dey'd a lef' bidout tellin' anybody goodbye. All 'ceppin' Brer Rabbit. Bless yo' soul, he'd er stayed fer ter see de fun, des lak he did dat t'er time w'en he skeer um all so. I 'speck I done tole you 'bout dat."

"When he got the honey on him and rolled in the leaves?"

Uncle Remus thought a moment.

"Ef I make no mistakes in my 'membunce, dat wuz de time w'en he call hisse'f de Wuller-de-Wust."

The little boy corroborated Uncle Remus's memory.

"Well, den, dish yer wuz n'er time, en he lak ter skeer um plum out'n de settlement. En it all come 'bout 'kaze dey wanter play smarty."

"Who wanted to play smarty, Uncle Remus?" asked the child.

"Oh, des dem t'er creeturs. Dey wuz allers a-layin' traps fer Brer Rabbit en gittin' cotch in um deyse'f, en dey wuz allers a-pursooin' atter 'im day in en day out. I aint 'nyin' but w'at some er Brer Rabbit pranks wuz mighty ha'sh, but w'y aint dey let 'im 'lone deyse'f?"

Naturally, the little boy was not prepared to meet these arguments, even had their gravity been less impressive, so he said nothing.

"In dem days," Uncle Remus went on, "de creeturs wuz same lak folks. Dey had der ups en dey had der downs; dey had der hard times, en dey had der saf' times. Some seasons der craps 'ud be good, en some seasons dey'd be bad. Brer Rabbit, he far'd lak de res' un um. W'at he'd make, dat he'd spen'. One season he tuck'n made a fine chance er goobers, en he 'low, he did, dat ef dey fetch 'im anywhars nigh de money w'at he speck dey would, he go ter town en buy de truck w'at needcessity call fer.

"He aint no sooner say dat dan ole Miss Rabbit, she vow, she did, dat it be a scannul en a shame ef he don't whirl in en git sevin tin-cups fer de chilluns fer ter drink out'n, en sevin tin-plates fer'm fer ter sop out'n, en a coffee-pot fer de fambly. Brer Rabbit say dat des zackly w'at he gwine do, en he 'low, he did, dat he gwine ter town de comin' We'n'sday."

Uncle Remus paused, and indulged in a hearty laugh before he resumed:

"Brer Rabbit wa'n't mo'n out de gate 'fo' Miss Rabbit, she slapped on 'er bonnet, she did, en rush 'cross ter Miss Mink house, en she aint bin dar a minnit 'fo' she up'n tell Miss Mink dat Brer Rabbit done promise ter go ter town We'n'sday comin' en git de chilluns sump'n. Co'se, w'en Mr. Mink come home, Miss Mink she up'n 'low she want ter know w'at de reason he can't buy sump'n fer his chilluns same ez Brer Rabbit do fer his'n, en dey quo'll en quo'll des lak folks. Atter dat Miss Mink she kyar de news ter Miss Fox, en den Brer Fox he tuck'n got a rakin' over de coals. Miss Fox she tell Miss Wolf, en Miss Wolf she tell Miss B'ar, en 'twant long 'fo' eve'ybody in dem diggins know dat Brer Rabbit gwine ter town de comin' We'n'sday fer ter git his chilluns sump'n; en all de yuther creeturs' chilluns ax der ma w'at de reason der pa can't git *dem* sump'n. So dar it went."

"Brer Fox, en Brer Wolf, en Brer B'ar, dey make up der mines, dey did, dat ef dey gwine ter ketch up wid Brer Rabbit, dat wuz de

time, en dey fix up a plan dat dey'd lay fer Brer Rabbit en nab 'im w'en he come back fum town. Dey tuck'n make all der 'rangements, en wait fer de day.

"Sho nuff, w'en We'n'sday come, Brer Rabbit e't he brekkus 'fo' sun-up, en put out fer town. He tuck'n got hisse'f a dram, en a plug er terbarker, en a pocket-hankcher, en he got de ole 'oman a coffee-pot, en he got de chilluns sevin tin-cups en sevin tin-plates, en den to'des evenin' he start back home. He walk 'long, he did, feelin' mighty biggity, but bimeby w'en he git sorter tired, he sot down und' a black-jack tree, en 'gun to fun hisse'f wid one er de platters.

"W'iles he doin' dis a little bit er teenchy sap-sucker run up'n down de tree en keep on makin' mighty quare fuss. Atter w'ile Brer Rabbit tuck'n shoo at 'im wid de platter. Seem lak dis make de teenchy little sap-sucker mighty mad, en he rush out on a lim' right over Brer Rabbit, en he sing out:

'Pilly-pee, pilly-wee!
I see w'at he no see!
I see, pilly-pee,
I see, w'at he no see!'

"He keep on singin' dis, he did, twel Brer Rabbit 'gun ter look 'roun', en he aint no sooner do dis dan he see marks in de san' whar some un done bin dar 'fo' 'im, en he look little closer en den he see w'at de sap-sucker drivin' at. He scratch his head, Brer Rabbit did, en he 'low ter hisse'f:

"'Ah-yi! Yer whar Brer Fox bin settin', en dar de print er his nice bushy tail. Yer whar Brer Wolf bin settin', en dar de print er his fine long tail. Yer whar Brer B'ar bin squattin' on he hunkers, en dar de print w'ich he aint got no tail. Dey er all bin yer, en I lay dey er hidin' out in de big gully down dar in de holler.'

"Wid dat, ole man Rab tuck'n put he truck in de bushes, en den he run 'way 'roun' fer ter see w'at he kin see. Sho nuff," continued Uncle Remus, with a curious air of elation,—"sho nuff, w'en Brer Rabbit git over agin de big gully down in de holler, dar dey wuz. Brer Fox, he 'uz on one side er de road, en Brer Wolf 'uz on de t'er side; en ole Brer B'ar he 'uz quiled up in de gully takin' a nap.

"Brer Rabbit, he tuck'n peep at um, he did, en he lick he foot en roach back he h'ar, en den hol' his han's 'cross his mouf en laff lak some chilluns does w'en dey think dey er foolin' der ma."

"Not me, Uncle Remus—not me!" exclaimed the little boy promptly.

"Heyo dar! don't kick 'fo' you er spurred, honey! Brer Rabbit, he seed um all dar, en he tuck'n grin, he did, en den he lit out ter whar he done lef' he truck, en w'en he git dar he dance 'roun' en slap hise'f on de leg, en make all sorts er kuse motions. Den he go ter wuk en tu'n de coffee-pot upside down en stick it on he head; den he run his gallus thoo de han'les er de cups, en sling um crosst he shoulder; den he'vide de platters, some in one han' en some in de yuther. Atter he git good en ready, he crope ter de top er de hill, he did, en tuck a runnin' start, en flew down like a harrycane—*rickety, rackety, slambang!*"

The little boy clapped his hands enthusiastically.

"Bless yo' soul, dem creeturs aint year no fuss lak dat, en dey aint seed no man w'at look lak Brer Rabbit do, wid de coffee-pot on he head, en de cups a rattlin' on he gallus, en de platters a wavin' en a shinin' in de a'r.

"Now, mine you, ole Brer B'ar wuz layin' off up de gully takin' a nap, en de fuss skeer 'im so bad dat he make a break en run over Brer Fox. He rush out in de road, he did, en w'en he see de sight, he whirl roun' en run over Brer Wolf. Wid der scramblin' en der scufflin', Brer Rabbit got right on um 'fo' dey kin git away. He holler out, he did:

"'Gimme room! Tu'n me loose! I'm ole man Spewter-Splutter wid long claws, en scales on my back! I'm snaggle-toofed en double-j'inted! Gimme room!'

"Eve'y time he'd fetch a whoop, he'd rattle de cups en slap de platters tergedder—*rickety, rackety, slambang!* En I let you know w'en dem creeturs got dey lim's tergedder dey split de win', dey did dat. Ole Brer B'ar, he struck a stump w'at stood in de way, en I aint gwine tell you how he to' it up kaze you wont b'leeve me, but de next mawnin' Brer Rabbit en his chilluns went back dar, dey did, en dey got nuff splinters fer ter make um kin'lin' wood all de winter. Yasser! Des ez sho ez I'm a-settin' by dish yer h'ath."

V.

MR. MAN HAS SOME MEAT.

THE little boy sat watching Uncle Remus sharpen his shoe-knife. The old man's head moved in sympathy with his hands, and he mumbled fragments of a song. Occasionally he would feel of the edge of the blade with his thumb, and then begin to sharpen it again. The comical appearance of the venerable darkey finally had its effect upon the child, for suddenly he broke into a hearty peal of laughter; whereupon, Uncle Remus stopped shaking his head and singing his mumbly-song, and assumed a very dignified attitude. Then he drew a long, deep breath, and said:

"W'en folks gits ole en strucken wid de palsy, dey mus speck ter be laff'd at. Goodness knows, I bin use ter dat sence de day my whiskers 'gun to bleach."

"Why, I wasn't laughing at you, Uncle Remus; I declare I wasn't," cried the little boy. "I thought may be you might be doing your head like Brother Rabbit did when he was fixing to cut his meat."

Uncle Remus's seriousness was immediately driven away by a broad and appreciative grin.

"Now, dat de way ter talk, honey, en I boun' you wan't fur wrong, n'er, 'kaze fer all dey'll tell you dat Brer Rabbit make he livin' 'long er nibblin' at grass en greens, hit 'twan't dat away in dem days, 'kaze I got in my membunce right now de 'casion whar Brer Rabbit is tuck'n e't meat."

The little boy had learned that it was not best to make any display of impatience, and so he waited quietly while Uncle Remus busied himself with arranging the tools on his shoe-bench. Presently the old man began.

"Hit so happen dat one day Brer Rabbit meet up wid Brer Fox, en w'en dey 'quire atter der coporosity, dey fine out dat bofe un um mighty po'ly. Brer Fox, he 'low, he do, dat he monstus hongry, en Brer Rabbit, he 'spon' dat he got a mighty hankerin' atter vittles hisse'f. Bimeby dey look up de big road, en dey see Mr. Man comin' 'long wid a great big hunk er beef und' he arm. Brer Fox, he up'n 'low, he did, dat he lak mighty well fer ter git a ta'se er dat, en Brer Rabbit he 'low dat de sight er dat nice meat all lineded wid taller is nuff fer ter run a body 'stracted.

"Mr. Man he come en he come 'long. Brer Rabbit en Brer Fox dey look en dey look at 'im. Dey wink der eye en der mouf water. Brer Rabbit he 'low he bleedz ter git some er dat meat. Brer Fox, he 'spon', he did, dat it look mighty fur off ter him. Den Brer Rabbit tell Brer Fox fer ter foller 'long atter 'im in hailin' distuns, en wid dat he put out, he did, en 'twan't long 'fo' he kotch up wid Mr. Man.

"Dey pass de time er day, en den dey went joggin' 'long de road same lak dey 'uz gwine 'pun a journey. Brer Rabbit he keep on snuffin' de a'r. Mr. Man up'n ax 'im is he got a bad cole, en Brer Rabbit 'spon' dat he smell sump'n' w'ich it don't smell like ripe peaches. Bimeby, Brer Rabbit 'gun to hol' he nose, he did, en atter w'ile he sing out:

"'Gracious en de goodness, Mr. Man! hit's dat meat er yone. *Phew!* Whar'bouts is you pick up dat meat at?'

"Dis make Mr. Man feel sorter 'shame hisse'f, en ter make marters wuss, yer come a great big green fly a-zoonin' 'roun'. Brer Rabbit he git way off on ter side er de road, en he keep on hol'in' he nose. Mr. Man, he look sorter sheepish, he did, en dey aint gone fur 'fo' he put de meat down on de side er de road, en he tuck'n ax Brer Rabbit w'at dey gwine do 'bout it. Brer Rabbit he 'low, he did:

"'I year tell in my time dat ef you take'n drag a piece er meat thoo' de dus' hit'll fetch back hits freshness. I aint no superspicious man myse'f,' sezee, 'en I aint got no 'speunce wid no sech doin's, but dem w'at tell me, dey say dey done try it. Yit I knows dis,' sez Brer Rabbit, sezee, 'I knows dat 'taint gwine do no harm, kaze de grit w'at gits on de meat kin be wash off,' sez Brer Rabbit, sezee.

"'I aint got no string,' sez Mr. Man, sezee.

"Brer Rabbit laff hearty, but still he hol' he nose.

"'Time you bin in de bushes long ez I is, you wont miss strings,' sez Brer Rabbit, sezee.

"Wid dat Brer Rabbit lipt out, en he aint gone long 'fo' he come hoppin' back wid a whole passel er bamboo vines, all tie tergedder. Mr. Man, he 'low:

"'Dat line mighty long.'

"Brer Rabbit he 'low:

"'Tooby sho', you want de win' fer ter git 'twix' you en dat meat.'

"Den Mr. Man tuck'n tied de bamboo line ter de meat. Brer Rabbit he broke off a 'simmon bush, he did, en 'low dat he'd stay behime en keep de flies off. Mr. Man he go on befo' en drag de meat, en Brer Rabbit he stay behime, he did, en take keer un it."

Here Uncle Remus was compelled to pause and laugh before he could proceed with the story.

"En he is take keer un it, mon — dat he is. He tuck'n got 'im a rock, en w'iles Mr. Man gwine 'long bidout lookin' back, he ondo de meat en tie de rock ter de bamboo line, en w'en Brer Fox foller on, sho' 'nuff, dar lay de meat. Mr. Man, he drug de rock, he did, en Brer Rabbit he keep de flies off, twel atter dey gone on right smart piece, en den w'en Mr. Man look 'roun', whar wuz ole man Rabbit?

"Bless yo' soul, Brer Rabbit done gone back en jine Brer Fox, en he wuz des in time, at dat, 'kase little mo' en Brer Fox would 'a' done bin outer sight en yearin'. En so dat de way Brer Rabbit git Mr. Man meat."

The little boy reflected a little, and then said:

"Uncle Remus, wasn't that stealing?"

"Well, I tell you 'bout dat, honey," responded the old man, with the air of one who is willing to compromise. "In dem days de

creeturs bleedz ter look out fer deyse'f, mo' speshually dem w'at aint got hawn an huff. Brer Rabbit aint got no hawn an huff, en he bleedz ter be he own lawyer."

Just then the little boy heard his father's buggy rattling down the avenue, and he ran out into the darkness to meet it. After he was gone, Uncle Remus sat a long time rubbing his hands and looking serious. Finally he leaned back in his chair, and exclaimed:

"Dat little chap gittin' too much fer ole Remus—dat he is!"

VI.

HOW BROTHER RABBIT GOT THE MEAT.

WHEN the little boy next visited Uncle Remus the cabin was dark and empty and the door shut. The old man was gone. He was absent for several nights, but at last one night the little boy saw a welcome light in the cabin, and he made haste to pay Uncle Remus a visit. He was full of questions:

"Goodness, Uncle Remus! Where in the world have you been? I thought you were gone for good. Mamma said she reckoned the treatment here didn't suit you, and you had gone off to get some of your town friends to hire you."

"Is Miss Sally tell you dat, honey? Well, ef she aint de beatenes' w'ite 'oman dis side er kingdom come, you kin des shoot me. Miss Sally tuck'n writ me a pass wid 'er own han's fer ter go see some er my kin down dar in de Ashbank settlement. Yo' mammy quare 'oman, honey, sho'!

"En yit, w'at de good er my stayin' yer? T'er night, I aint mo'n git good en started 'fo' you er up en gone, en I aint seed ha'r ner hide un you sence. W'en I see you do dat, I 'low ter myse'f dat hit's des 'bout time fer ole man Remus fer ter pack up he duds en go hunt comp'ny some'r's else."

"Well, Uncle Remus," exclaimed the little boy in a tone of expostulation, "didn't Brother Fox get the meat, and wasn't that the end of the story?"

Uncle Remus started to laugh, but he changed his mind so suddenly that the little boy was convulsed. The old man groaned and looked at the rafters with a curious air of disinterestedness. After a while he went on with great seriousness:

"I dunner w'at kinder idee folks got 'bout Brer Rabbit nohow, dat I don't. S'pozen you lays de plans so some yuther chap kin git a big hunk er goody, is you gwine ter set off some'r's en see 'im make way wid it?"

"What kind of goody, Uncle Remus?"

"Dish yer kinder goody w'at town folks keeps. Mint draps en reezins, en sweet doin's lak Miss Sally keep und' lock en key. Well, den, ef you gits some er dat, er may be some yuther kinder goody, w'ich I wish 'twuz yer right dis blessid minnit, is you gwine ter set quile up in dat cheer en let n'er chap run off wid it? Dat you aint—dat you aint!"

"Oh, I know!" exclaimed the little boy. "Brother Rabbit went back and made Brother Fox give him his part of the meat."

"Des lak I tell you, honey; dey wan't no man mungs de creeturs w'at kin stan' right flat-footed en wuk he min' quick lak Brer Rabbit. He tuck'n tie de rock on de string, stidder de meat, en he pursue long atter it, he did, twel Mr. Man tu'n a ben' in de road, en den Brer Rabbit, he des lit out fum dar—*terbuckity-buckity, buck-buck-buckity!* en 'twan't long 'fo' he tuck'n kotch up wid Brer Fox. Dey tuck de meat, dey did, en kyar'd it way off in de woods, en laid it down on a clean place on de groun'.

"Dey laid it down, dey did," continued Uncle Remus, drawing his chair up closer to the little boy, "en den Brer Fox 'low dey better sample it, en Brer Rabbit, he 'gree. Wid dat, Brer Fox, he tuck'n gnyaw off a hunk, en he shut bofe eyes, he did, en he chaw en chaw, en ta'se en tas'e, en chaw en tas'e. Brer Rabbit, he watch 'im, but Brer Fox, he keep bofe eyes shot, en he chaw en tas'e, en tas'e en chaw."

Uncle Remus not only furnished a pantomime accompaniment to this recital by shutting his eyes and pretending to taste, but he lowered his voice to a pitch of tragical significance in reporting the dialogue that ensued:

"Den Brer Fox smack he mouf en look at de meat mo' closeter, en up'n 'low:

"'Brer Rabbit, *hit's lam'!*'

"'*No*, Brer Fox! *shol'y not!*'

"'Brer Rabbit, *hit's lam'!*'

"'Brer Fox, *tooby sho'ly not!*'

"Den Brer Rabbit, he tuck'n gnyaw off a hunk, en he shot bofe eyes, en chaw en tas'e, en tas'e en chaw. Den he smack he mouf, en up'n 'low:

"'Brer Fox, *hit's shote!*'

"'Brer Rabbit, you foolin' me!'

"'Brer Fox, *I vow hit's shote!*'

"'Brer Rabbit, hit des *can't be!*'

"'Brer Fox, *hit sho'ly is!*'

"Dey tas'e en dey 'spute, en de 'spute en dey tas'e. Atter w'ile, Brer Rabbit make lak he want some water, en he rush off in de bushes, en d'reckly yer he come back wipin' he mouf en cl'erin' up he th'oat. Den Brer Fox he want some water sho' nuff:

"'Brer Rabbit, whar you fin' de spring?'

"'Cross de road, en down de hill en up de big gully.'

"Brer Fox, he lope off, he did, en atter he gone Brer Rabbit totch he year wid he behime foot lak he flippin' 'im good-bye. Brer Fox, he cross de road en rush down de hill, he did, yit he aint fin' no big gully. He keep on gwine twel he fin' de big gully, yit he aint fin' no spring.

"W'iles all dish yer gwine on, Brer Rabbit he tuck'n grabble a hole in de groun', he did, en in dat hole he hide de meat. Atter he git it good en hid, he tuck'n cut 'im a long keen hick'ry, en atter so long a time, w'en he year Brer Fox comin' back he got in a clump er bushes, en tuck dat hick'ry en let in on a saplin', en ev'y time he hit de saplin', he 'ud squall out, Brer Rabbit would, des lak de patter-rollers had 'im:

"*Pow, pow!* 'Oh, pray, Mr. Man!'—*Pow, pow!* 'Oh, pray, Mr. Man!'—*Chippy-row, pow!* 'Oh, Lordy, Mr. Man! Brer Fox tuck yo' meat!'—*Pow!* 'Oh, pray, Mr. Man! Brer Fox tuck yo' meat!'"

Every time Uncle Remus said "*Pow!*" he struck himself in the palm of his hand with a shoe-sole by way of illustration.

"Co'se," he went on, "w'en Brer Fox year dis kinder doin's, he fotch up, he did, en lissen, en ev'y time he year de hick'ry come down *pow!* he tuck'n grin en 'low ter hisse'f, 'Ah-yi! you fool me 'bout de water! Ah-yi! you fool me 'bout de water!'

"Atter so long a time, de racket sorter die out, en seem lak Mr. Man wuz draggin' Brer Rabbit off. Dis make Brer Fox feel mighty skittish. Bimeby Brer Rabbit come a callyhootin' back des a hollerin':

"'Run, Brer Fox, run! Mr. Man say he gwine to kyar dat meat up de road ter whar he son is, en den he's a comin' back atter you. Run, Brer Fox, run!'

"En I let you know," said Uncle Remus, leaning back and laughing to see the little boy laugh. "I let you know Brer Fox got mighty skace in dat neighborhood!"

DROUGHT.

The old cry beats upon the out-stretched heaven:
"How long, O Lord, how long wilt Thou deny?
In wearied hearts fear works its sickly leaven,
As one by one the water-springs go dry.

"The throats that call on Thee are choked with trouble,
And faint for impotence to reach Thine ear;
The cattle gnaw fog-blackened dust and stubble;
The corn untimely crackles and grows sere.

"Hast Thou forgotten, Majesty Unbounded,
Thy thirsting creatures in Thy ashen land,—
With clouds and darkness all Thy ways surrounded,
And ocean's waters in Thy hollowed hand?"

Forgotten? He, who planned from everlasting
The awful convolution of the spheres;
To whom are one, remembrance and forecasting,
And one day even as a thousand years;

Within whose vast design, the sparrow falling
Is counted as the meteor's gleaming race;
The favoring breeze, the hurricane appalling
That turns the deep sea to a burial-place;

One valley panting for the rain in season,
And one uptorn by floods that leave it strewed
With wreck of lives and homes. O futile reason,
With fathom-line to sound Infinitude!

Yea, as the heavens than the earth are higher,
So are His ways, His thoughts, to those of man:
To Him a breath, ten Sabbaths dry and dryer;
Ten years of thirsting spirit but a span.

James T. McKay.

OLD AND NEW ROSES.

It is worthy of note that our fathers and forefathers had in general a better nomenclature for their roses than is used in these days. Such names as Dame Blanche, La Favorite, Rosalie, La Coquette, and those of the various mythological characters — as Hebe, Juno, and Calypso — were freely used. Now the favorite roses are Dukes and Duchesses, Counts and Countesses, Lords and Ladies, Generals and Senators, till we wonder if there are any plebeians left.

There are many old roses that should never be forgotten, though they have been pushed aside by new-comers, and are seldom to be found on sale at the florist's. Blanchefleur, Madame Hardy, Madame Zœtman are delightfully fragrant, beautiful white roses, whose places have not been filled by any of the usurping remontants; and there are others, of the Provençe and Damask families, nearly as fine as those named. In all our improvements, we have not yet bettered the quality of the old white summer roses of thirty and forty years ago. The demand is now altogether for those varieties which bloom more than once, and, in achieving freedom of bloom, we have lost in fragrance, have lost in hardiness; therefore, to leave out and cast aside these favorites of a generation that is passing away is surely a serious mistake. Others beside the old white summer roses should be retained. There is the Centifolia, or cabbage-rose, so unfortunately named, which is yet a model for form and fragrance; there is the common sweet-brier, with its bright orange-red heps,— not a flower for florists truly, but how attractive to the artist, how full of inspiration to the poet, how grateful to all who are pleased by fragrance! For bright yellow shades, we yet look to the old Austrian roses, so called, Harrison's and Persian Yellow. Then what is more charming than the moss-roses? what bouquet more beautiful than loose branches of the Gracilis, the Common and Crested moss-roses?

The Charles Lawson, Coupe d'Hébé, Paul Ricaut, and some others of the old summer kinds are also very useful as pillar roses; they have nearly everything that makes a rose valuable save the property of blossoming more than once. It must also be remembered that the old roses were not alone such as bloomed in June only. Agrippina, Edward Desfosses, Hermosa, Souvenir de la Malmaison, Aimée Vibert, Lamarque, Solfaterre, Bon Silène, Bougère, Devoniensis, Flavescens, Madame de Vatry, Niphetos, Odorata, Safrano, Triomphe de Luxembourg are members of the Bengal, Bourbon, Noisette, and Tea families, introduced more than forty years ago, and in none of these groups has any great advance been made. Certainly, many beautiful and distinct varieties have since been introduced, but the improvement in quality of these classes has been slight as compared to the advance made by the introduction of new groups.

Roses of the present, as compared with those of the past, are superior by reason of the introduction of groups that are hardy, or nearly so, and that blossom at intervals and continuously through the summer and autumn. We remember the great interest awakened by the varieties sent out by Laffay, such as Madame Laffay, Mrs. Elliott, and, a few years after, La Reine. The two former have nearly disappeared from cultivation; but La Reine is still much grown, and, like the General Jacqueminot, Victor Verdier, and Jules Margottin, has been the progenitor of most of the hardy roses cultivated at this day.

It would astonish the uninitiated to learn the number, not only of those who propagate plants for sale, but those who are engaged in the production of new varieties from seed. Strange to say, the raising of new roses has been done successfully only in France and England. Italy and Germany have accomplished almost nothing in this line, although the climate of those countries is as favorable for the purpose as that of the other two; but in this they only follow the general line of horticultural progress, for Italy and Germany have produced few varieties of European fruits that are valuable. America has originated more fruits of high quality than any other country, but her contributions to the list of good roses, though larger than those of Italy and Germany, fall far short of what they should be. With an extent of territory that gives greater variation of climate and soil than is to be found in any other country, it must be that America will yet produce her share of fine roses.

With the year 1842 appeared the Baronne Prévost, which is now the oldest type among hybrid remontant roses. It is not a numerous family, and is of much less importance to us than many others, but we can well imagine

what pleasure it gave when it was introduced to the rosarians of that day. The flowers are very large and full, flat in form, quite fragrant, and in color some shade of rose. It is the most hardy type we have. The only varieties commonly grown are Boieldieu, Colonel de Rougemont, and Madame Boll.

In 1843, Laffay introduced what he loyally named Rose of the Queen *(Rose de la Reine)*. This variety bore royal sway for many years. It not only still sells well and is to be considered a useful rose, but it should also have our esteem as being the parent of a most useful family. The flowers are of various shades of rose, generally of semi-globular form, large, somewhat fragrant; free in the autumn; quite hardy, enduring more cold than any of the other families except Baronne Prévost. The leading sorts are: Anne de Diesbach, Antoine Mouton, Auguste Mie, Belle Normande, François Michelon, Madame Nachury, Paul Neyron. Among the varieties of this family none equal in merit the François Michelon.

The Giant of Battles was introduced by Nérard in 1846, and doubtless has Bourbon blood in its veins. The colors are of various shadings of crimson, very rich and effective when in perfection, but very fleeting. The sun soon gives them a muddy hue. The flowers are well shaped but small, and have slight fragrance; they are very freely produced in the spring and summer months, but as a rule not in the autumn. The foliage is of lustrous dark green, very subject to mildew. They are difficult to propagate from cuttings, and are liable to injury from frost. The leading sorts are: Cardinal Patrizzi, Crimson Bedder, Empereur de Maroc, Eugène Appert, Lord Raglan, Mrs. Standish. Owing chiefly to their bad constitution, they are rapidly disappearing from cultivation, and in a few years it is likely none will remain. The same rich color can now be found in the Prince Camille family.

The General Jacqueminot, the head of what is now considered the most valuable type, made its bow, in 1852, to an admiring world: clad in rich crimson livery, it still commands respect and admiration, and marshaled under its generalship is the army of dark roses which so excite and please our senses by their charms and loveliness. This family probably originated from the old hybrid China, Gloire des Rosomanes; they are moderately hardy, but less so than those of the Baronne Prévost, Jules Margottin, and La Reine types. The flowers are invariably shades of red and crimson, generally highly perfumed, freely produced in the spring, but varying greatly as to their autumnal bloom. As a family, they are much more shy in the autumn than any of the others. It is now the most numerous of the families, due to the fact that popular taste inclines more to crimson than to light-colored roses. Leading varieties of this type are Beauty of Waltham, Marie Baumann (moderate growth), Marie Rady, Maurice Bernardin, Pierre Notting, Xavier Olibo (dwarf growth), also Sénateur Vaisse, Charles Lefebvre, Prince Camille, Alfred Colomb, and Duke of Edinburgh. About the latter varieties cluster numerous others of the family of less importance.

The head of the Victor Verdier type originated with the greatest of all the raisers, Lacharme, of Lyons, and was sent out by him in 1852. It is doubtless from one of the La Reine type, crossed with some monthly rose, probably a Bourbon. The descendants are very numerous, and in spite of their rather tender habits, form a valuable group, being the most free to flower of them all. If they were fragrant, they would be unrivaled; but alas! they are devoid of scent, and therefore cannot rank as high as the others. Fine feathers alone do not make fine birds, and surely fragrance is to the rose what song is to the bird. Its flowers are large, well built up; generally shades of rose and pink prevail; mildew operates against these more than any others except the Giant of Battles type. Of all the families it is the best adapted for forcing in winter. The leading varieties grown are Captain Christy, Countess of Oxford, Étienne Levet, Hippolyte Jamain, Julius Finger, Madame George Schwartz, Mademoiselle Eugénie Verdier, Marie Cointet, Marie Finger, Mrs. Baker, Oxonian (somewhat fragrant), Président Thiers, Pride of Waltham, Rosy Morn.

In 1853, Jules Margottin, of Bourg-la-Reine, near Paris, sent out a fine rose, which he called after himself. Though he has been raising seedling roses ever since, none of them has quite come up in worth to his namesake, the flowers of which are large in size, very full, somewhat flat in shape, in shades of rose and carmine, and almost without perfume. They are generally free in the autumn, are very hardy, though as a rule difficult of propagation from cuttings, but making very vigorous plants when budded. The leading sorts: Abel Grand, Bessie Johnson (quite fragrant), Charles Margottin (reddish crimson), Countess of Serenye, Duchesse de Vallombrosa, Edward Morren, Egeria, Emily Laxton, John Hopper, Magna Charta, Madame Gabriel Luizet, Madame Lacharme, Madame Louis Lévêque, Mademoiselle Thérèse Levet, Marchioness of Exeter, Marguérite de St. Amande, Marquise de Castellane, Miss Hassard (scented), Monsieur Noman, Peach Blossom, Princess Mary of

Cambridge, and Rev. J. B. Camm, which is very sweet.

The Sénateur Vaisse became known in 1859. In this family we find the most perfectly formed flowers; the varieties are of moderate growth, with smoother wood than most of the others. The foliage is more round and perhaps of a deeper green. Madame Victor Verdier, Monsieur E. Y. Teas, and Mrs. Laxton form the leading members.

Charles Léfebvre, one of Lacharme's productions, was introduced in 1861. The originator believes that this came from a cross of Victor Verdier and General Jacqueminot. It certainly takes after the characteristics of those two sorts. The flowers are more wavy in outline than in the other families; the growth is somewhat less vigorous, the wood more smooth. Dr. Andry, Glory of Cheshunt, Harrison Weir, Horace Vernet, Lord Macaulay, Madame Anna de Besobrasoff, Marguerite Brassac, Mrs. Harry Turner, Paul Jamain, and W. Wilson Saunders are the leading kinds.

Prince Camille, which was introduced in 1861, by E. Verdier, gives us the darkest type of roses which we have. From appearances, we should think it originated in a natural cross between varieties of the Giant of Battles and General Jacqueminot types, the characteristics of the latter predominating. None of these bloom freely in autumn, but they are magnificent in their dark, velvety shades, as seen in the spring. Baron Chaurand, Baron de Bonstetten, Abel Carrière, Henry Bennett, Jean Cherpin, Jean Liabaud, Jean Soupert, La Rosière, Monsieur Boncenne, and Président Léon de St. Jean comprise the family. More than the others, Abel Carrière and Jean Soupert take after Giant of Battles.

Alfred Colomb, another of Lacharme's raising (1865), has a similar habit of growth to the Jacqueminot type, but the thorns are less numerous and with more of a yellowish hue. The flowers are more globular, stand the sun better, and are much more freely produced, constituting a most valuable family. The varieties are A. K. Williams, Fisher Holmes, and Wilhelm Kœlle.

The Duke of Edinburgh, sent out by George Paul in 1868, is the only English rose which may be regarded as the founder of a family. The flowers are inclined to be thinner in petal than those of the Jacqueminot type, rather smaller, burn much more quickly in the sun, and are not constant in autumn. It is a very beautiful family when grown in a moist, cool climate; but there are few of the members that will do well under our hot sun. The varieties best known, mostly of recent origin, are, Brightness of Cheshunt, Dr. Hooker, Duke of Connaught, Duke of Teck, Robert Marnock, S. Reynolds Hole, Sultan of Zanzibar, and The Shah.

Baroness Rothschild is the typical representative of a small but very beautiful family, the very aristocracy of roses. It is not a new rose, but its merits have not been recognized till within a few years. Now that the florists have finally taken it for winter forcing, it is becoming well known, but it will always command comparatively high prices. Twelve and fifteen dollars for a dozen blooms have been the prices during the winter months. Mabel Morrison, Merveille de Lyon, and White Baroness are three white roses of the type that are to-day the special sensation of the rose world. They have the same short-jointed stems, with the beautiful foliage closely set under the blooms, that are a characteristic and pleasing feature of the parent. Mabel Morrison is the only one of the white trio which is likely to be seen in any number for some time to come; the others are but just out, and florists will use all the wood the plants make for propagating. Three white, hardy varieties of such high rank as these may well excite the enthusiasm of all who grow roses.

The above description exhausts the divisions which may be considered distinct types. Though there are other roses which stand aloof, they have few or no followers. Such are Madame Charles Wood, Caroline de Sansal, and a few others.

All of the families of roses so far discussed are members of the Hybrid Remontant or Hybrid Perpetual class, certainly the most important of the many groups of roses now cultivated; but there are others of modern origin, which have also strong claims on our attention, the oldest of which is the Hybrid Noisette family, that may be divided into two sections. The original variety, Madame Récamier, was sent out by Lacharme in 1853. Nothing more is known of the origin of this sort, other than that one of the parents is supposed to have been a Noisette rose. Belonging to this type are Mademoiselle Bonnaire, Madame Noman, Eliza Boelle, and Madame Oswald de Kerchove. The flowers are of medium size, and of circular, very beautiful form. Though devoid of fragrance, the flowers are freely produced from June throughout the summer; for which reason these varieties are to be valued as most charming acquisitions on our list of white or light-tinted roses.

In 1860, Lacharme sent out Madame Gustave Bonnet, the head of the second division of the Hybrid Noisette family. This variety, the originator claims, was produced from seed of Blanche Lafitte (Bourbon), fertilized by

THE DUKE OF EDINBURGH ROSE.

Sappho (Portland). If this be true, this type should go by some other term than Hybrid Noisette; but the name has been fixed by usage, and as they have no fragrance, they will, at all events, smell as sweet by this name as any other. Belonging to the same type as Madame Gustave Bonnet are Louise Darzens, Madame Alfred de Rougemont, Baronne de Maynard, Coquette des Alpes, Coquette des Blanches, and Madame François Pittet, all raised by Lacharme. Madame Bellenden Ker, Perfection des Blanches, and Madame Auguste Perrin, of the same family, are the production of other persons. These kinds differ from those of the Mademoiselle Bonnair type, in being of more vigorous habit of smoother wood, and of more oval and glaucous foliage, more like that of the Bourbons. The flowers are even more freely produced, but are inferior in quality to those of the other type.

Gloire de Dijon was sent out in 1853. In its habit of growth, it showed itself distinct

from all others, and has become the head of a class now known as Climbing Teas. When the plant has once become established it is of vigorous growth, and has long been a favorite as a pillar rose, both for conservatories and in favorable situations out of doors. Its parentage is not known, but I believe it must have originated from a natural cross between a Bourbon and a tea-scented Noisette rose. The most popular kinds of this type are Gloire de Bordeaux, Belle Lyonnaise, Madame Trifle, Madame Bèrard, Marie Berton, Beauty of Europe, and Reine Marie Pia, but none of them has attracted the same attention as the old sort.

The most valuable type of roses since General Jacqueminot is the Hybrid Tea. The original of this new race is La France, introduced, in 1869, by Guillot, of Lyons. This was raised from the seed of a Tea rose, but is entirely distinct from all tea-scented kinds. In color it is a soft, silvery rose, delicately tinged with a faint shade of lilac; in its fragrance, a most delightful combination of the Provençe and Tea perfumes. It blooms perpetually, the end of each shoot always carrying a flower-bud, and these shoots constantly pushing forth. In these three qualities, so essential to a perfect rose, it has scarcely any equal, and solely by its intrinsic merits has now gained a popularity shared by few or none others of its sisterhood. Duchess of Connaught and Viscountess Falmouth, raised by Bennett, of England, are varieties of the same type, which most nearly approach La France, both in appearance and fragrance. Next to them comes Madame Alexandre Bernaix, raised by Guillot. Michael Saunders, Duke of Connaught, and Nancy Lee, all varieties of Bennett's, are very beautiful; but the two last named are of such delicate habit that they will never be useful for general culture.

The Polyantha Rose is of recent introduction. The original, which is a native of Japan, has very small, single white flowers, about the size of a silver twenty-five-cent piece; it is of sarmentous growth, quite hardy, and blooms in panicles, in the spring. Some of the French growers have raised seedlings, crosses (natural or artificial) with Teas or other classes, which are true everblooming roses and of great merit. The varieties best known are Paquerette, Anne Marie de Montravel, Mignonette, and Cécile Brünner. They are more tender than the parent, but are quite as hardy as the Hybrid Noisettes and the Hybrid Teas. As an edging for a bed of monthly roses, nothing can be more effective than a row or two of Paquerette or one of the other Polyanthas. They are extremely beautiful little flowers, which will survive all the sneers of the horticultural snobs who see no beauty in a rose much smaller in size than a peony.

The attention of hybridizers is now directed toward crossing varieties of Tea with Hybrid Remontant roses, and new sorts of great value may confidently be expected from the efforts which are being made in this line. To obtain a variety which shall in a large degree combine the hardiness of La Reine or Jacqueminot, with the fragrance and free-blooming qualities of Madame Bravy or Bon Silène, is surely worth striving for.

This leads us to a consideration of the roses of the future, what they may be, what they should be. Roses of the past have been the product of nature, unaided by the hand of man. Roses of the present also chiefly come from sowing the seeds of varieties which have not been crossed, except as the crossing has been a matter of chance by natural agencies. In some instances efforts at artificial hybridization have been recorded that have given successful results. Roses of the future may and should come principally as the result of artificial fecundation and hybridization. A long essay would be required to treat this subject and do it justice in a magazine article. I can only touch on some of the more salient points. Laffay, who raised most of the Hybrid Remontants of value previous to 1850, is understood to have produced many of them by crossing artificially varieties of the Bourbon roses with the old crimson Rose du Roi. Vibert, Hardy, and some other of the French rosarians are also known to have produced a great many of our most beautiful roses by manual fertilization; but as no record has been kept of the varieties used for the purpose, the result of their work is of no use to the hybridizer of this day further than to afford proof that definite results can better be obtained from artificial than from natural crosses. Our aim should be to control and assist nature, as far as possible, in her tendency toward variation.

There has been so much carelessness, not to say ignorance, with regard to the parentage of the various varieties of roses, that I do not think it would be possible to name fifty kinds and give the parentage on both sides. For the past twenty-five years, nature has been so lavish in producing variations of great beauty, that those who have raised new roses have been content to gather the heps and sow the seed, depending on natural crosses to produce new and desirable kinds. Not only have they thus entirely relied on nature to accomplish what they wished; they have not even taken the pains, except in few instances, to separate the seed of one variety

THE MARIE BAUMANN ROSE.

from that of another, but have sowed them all promiscuously. To trace the peculiarities of each variety, learning just what influence each parent had in forming the qualities of the offspring, would be an interesting and profitable study. I hold it as an axiom, that, in the progeny of any rose which has been crossed with another, the influence of both parents can be distinctly traced.

Artificial crossing and hybridization of roses is generally performed by removing with fine scissors the stamens of the flower to be operated on, and then shaking over it the flower of that which contains the pollen to be used, or by gently dusting it on with a camel's-hair brush. In this manner it is supposed that the characteristics of each sort will be given in about equal measure to the progeny. It is not uncommon to cross varieties without removing the stamens, in which case the influence of the female parent is believed to preponderate; but neither of these methods has been accurately proved as to the results. An interesting question which arises, in connection with the subject of artificial fertilization, is how far removed from each other, in the habit of growth and in other peculiarities, may be the varieties which are

THE FRANÇOIS MICHELON ROSE.

to be used as parents, without preventing a successful crossing of the two.

In crossing roses, we are most certain to attain satisfactory results by blending seed-bearing varieties which have several characteristic features in common; thus, varieties of the same type will nearly always effect good crosses, as General Jacqueminot with Xavier Olibo, Madame Victor Verdier with E. Y. Teas; but, on account of a certain resemblance which must prevail among the kinds of one type, we are less likely to obtain new sorts of any marked individuality than would result from hybridizing varieties of one group by those of another not too widely separated group; in other words, we should avoid the extremes of crossing varieties too much alike, and of hybridizing one kind by another so widely removed in characteristics that a successful, healthy progeny cannot result. Here is a vast field still largely unexplored in which to study and experiment. This is not a matter to be confined to scientists; all who truly love roses, all that have some knowledge of their individual peculiarities, may engage in this fascinating pursuit with probabilities of success.

"This is an art
Which does mend nature, change it rather; but
The art itself is nature."

THE EUGÉNIE VERDIER ROSE.

A common error committed by the beginner is in attempting to grow varieties that are of delicate habit and feeble constitution. Attracted by the great beauty or fragrance of a flower, he does not consider, or does not understand, that vigor of growth, perpetuity of bloom, and perfect hardiness are very seldom combined with the qualities which have allured him.

A pleasing departure from the usual method of growing roses is found in the pegging-down system. Grown in this way, the long shoots are carefully bent down and fastened to the ground by means of hooked sticks or pegs. Flower-buds will then push out all along the shoots, and a correspondingly large number of blooms be obtained. True, the individual flowers are apt to be of somewhat inferior quality to those produced in the ordinary way, but a mass of color not otherwise obtainable can thus be had. I do not advocate this system to the exclusion of the one commonly pursued, but its occasional or alternate use is certainly capable of yielding most satisfactory results.

Besides planting roses in beds, it is well to scatter them through the borders of our gardens, giving the favored positions to the more delicate kinds. Among the best varieties which yet require some extra care are Eugénie Verdier,—the most beautiful of the Victor Verdier type,—a rose of very delicate coloring, silvery-pink, tinged with salmon, and Charles Lefèbvre, which is beautiful in both flower and leaf, the color of General Jacqueminot deepened

by a shade of satiny-purple. Among the roses not sufficiently well known are Marguerite de St. Amande, a deep pink sort, which gives beautiful buds as well as fine flowers, and blossoms through the summer and autumn months; Baroness Rothschild, a blush-pink, with exquisite cup-shaped flowers freely produced; François Michelon, a striking variety, intermediate in character between its parent La Reine and General Jacqueminot, thus uniting two rival dynasties. It has large, deep rose-colored flowers, veined with lilac, and is of splendid globular form. It blooms late, the flowers not developing until most others of the same class are past their prime. Eliza Boelle is, perhaps, the best white rose that we have. It blooms profusely all through the summer months; the flowers are full, of the most perfect, globular form, the center generally tinged with blush. It is not possible to imagine a flower of greater beauty. The best of the moss-roses are Gracilis, Common, and Crested. Not the least of the qualities we desire in a rose is fragrance. In this regard, all varieties of all classes must do homage to La France, the sweetest of fragrant roses. To be sure, it is rather tender, but it is easily protected so as to winter safely. It does not always open well, but it is a simple matter to assist it, an operation not practicable with most varieties that open imperfectly. If the buds of La France show a tendency to remain closed, by gently pressing the point of the bloom with the fingers, and then blowing into the center, the flower will almost invariably expand, and the pent-up fragrance escape.

Not enough attention is given to the Bourbon and Tea roses. The Hybrid Remontants justly claim first attention, when they are in perfection; but after the first blossoming is over, throughout July, August, and September they are much less attractive than many of the monthly roses. Varieties like Bougère, Homer, Madame de Vatry, and Marie Van Houtte, will give a continuous supply of flowers when the so-called hardy roses are almost or altogether out of bloom. How faithfully the various varieties of Tea roses reproduce the beautiful tints often painted in the sky at sunset and at sunrise! The many shades of rose, pink, lilac, white, salmon, yellow, etc., are found in both alike, and it would often puzzle us to decide whether the most beautiful combinations of these delicate shades are found, in the illumined clouds, or in the petals of these roses. Tea roses are rather tender, but in truth they have, in this respect, been somewhat maligned. Those sorts named above are, in reality, but little more tender than La France, the Hybrid Noisettes, and all the Victor Verdier race of Hybrid Remontants. If earth be hilled up about the plants, and a slight covering of loose material, like branches of evergreens, be applied, the more robust sorts of monthly roses will winter in safety. In giving protection, care must be taken not to smother the plants by entirely excluding the air. This never occurs from the use of evergreen branches, but if straw or litter be taken, sticks or boards should be used to prevent the material matting together. This is one of the cases where it is possible to kill by mistaken kindness.

Canon Hole, in his charming "Book about Roses," says:

> "He who would have beautiful roses in his garden must have beautiful roses in his heart. He must love them well and always. He must have not only the glowing admiration, the enthusiasm, and the passion, but the tenderness, the thoughtfulness, the reverence, the watchfulness of love."

This is the sum and substance of success in rose culture; without this true love, failure, partial or complete, is sure to follow.

H. B. Ellwanger.

SUMMER SONGS.

TO A DAISY.

WEE, little rimless wheel of Fate,
With silver spokes and hub of yellow,
What gentle girl, in accents mellow,
Has sought your aid to find a mate?

Who snapt your slender spokes apart,
Each one some dear acquaintance naming?
And who was he—the loved one, claiming
The choicest chamber in her heart?

O tiny hub of golden hue
Kist by her fingers' tender pressing,
Still yet, methinks, she's vainly guessing
If what you prophesied were true.

You died between her finger-tips,
Sweet gypsy maid of wisdom magic;
Pray, is it worth a death so tragic
To hear the music of her lips?

Frank Dempster Sherman.

THE WILD BIRD'S SONG.

WHAT is it that the wild bird says?
Come listen to his song:—
"Sweet, love is of the summer time,
And summer is not long.

"The blossom fades upon the bough
Before the month of June,
And when at last the red rose comes
She tarries but a moon.

"Come while the earth is glad and green,
We'll build our nest together;
For love is of the summer time,
And cannot bide foul weather."

O sweetheart! listen, listen well,
Unto the wild bird's song:—
"Sweet, love is of the summer time
And summer is not long."

The May is white upon the hedge,
Why should we longer tarry?
When hedge-rows bloom and wild birds nest,
Then is the time to marry.

E. A. M.

ANGELS' WINGS.

WHEN summer days were warm, and sweet
With clover-bloom and ripening wheat,
We used to lie upon the grass
Within the flickering shadow spread
By leafy branches overhead,
And watch the bright clouds slowly pass.

They were so white against the blue,
With such a glory streaming through
Their silver fleeces, we were sure
They must, at least, be angels' wings;
And the mere fancy of such things
Kept childish speech and conduct pure.

We must not quarrel, when the skies,
For all we knew, were full of eyes
That watched to see if we were good;
And sometimes just the sight of one
White cloud illumined by the sun
Availed to check an angry mood.

Now we are women grown, and men,
That were but careless children then:
Wise with our realistic lore,
The shining mystery we explain—
Only a vapor born of rain!—
And dream of angels' wings no more.

But are we wiser, after all?
Haply the world-worn hearts recall,
With something like a thrill of dread,
What time the Master undefiled
"Set in their midst a little child"—
And what the words were that He said.

It might—we silently infer—
It might perhaps be easier
The kingdom of the Lord to win,
If still in far blue summer skies
We felt the watching angel eyes
That kept our childish hearts from sin.

Mary Bradley.

SUMMER.

See where the summer comes with heat of days
And garlanded with lily and with rose,
Down the bright garden's fragrant, sheltered ways,
With rhythmic footsteps dreamily she goes.

Not here she stays her steps, but passes through,
With pensive mien, the tasseled fields of corn,
Where late the evening stored its wealth of dew—
Jewels too early stolen by the morn.

But at the eventide she pauses where
The water-lilies float upon the pool,
And tender is the perfume-burdened air,
And the night breezes moist and soft and cool.

'Tis thus I give the summer all my praise,
'Tis thus I love her in her sweet repose,
Not with the passionate heat of summer days,
Though garlanded with lily and with rose.

Mrs. T. W. Dewing.

MORNING MEADOWS.

THE dew is on the grass,
The bee is in the clover;
The merry bird, the bobolink,
He sings and hovers over.

The mowers swing and sway,
They sway and swing together,
Across the meadow's shimmering green,
In the sweet summer weather.

About the wooded hills
The morning mists are clinging;
And in the swaths the mowers pause
And set their scythes a-ringing.

The dew is on the grass,
The bumble-bees are humming
Across the fields. O bobolink,
The swinging scythes are coming!

Beneath the blades and blooms,
Your quiet mate still presses
Her sober breast against her nest,
In shaded green recesses.

Cry out, O bobolink,
There's that which bodes disaster;
Laugh out, O jocund bobolink,
The scythes are swinging past her.

The dew is on the grass,
The bees are in the clover,
The merry bird, the bobolink,
He sings and hovers over—
Bobolink!

E. C. Messer.

SUMMER EVENING.

YON ragged cliff looks gentler down,
The twilight dims its grisly scars;
Hushed earth awaits that second dawn—
The morning of the moon and stars.

Far, dotting clouds—unguarded flock—
At pleasure rove the pathless sky,
While brightest eyes of waters still
Look up and count them passing by.

The joyous birds, from paths of air,
Into the closéd boughs have gone;
The little minstrels of the field
Alone their tireless pipes play on.

The nimble herds that take the hill,
The sober droves that crop the dell,
All beasts of toil, with creatures wild,
In universal shadow dwell.

John Vance Cheney.

THE SWALLOW.

SKIM o'er the tide,
And from thy pinions fling
The sparkling water-drops,
Sweet child of spring!
Bathe in the dying sunshine warm and bright,
Till ebbs the last receding wave of light.

Swift glides the hour,
But what its flight to thee?
Thine own is fleeter far;
E'en now to me
Thou seemest upon futurity anon
To beckon thence the tardy present on.

The eye in vain
Pursues, with subtle glance,
Thy dim, delirious course
Through heaven's expanse:
Vanished thy form upon the wings of thought,
Ere yet its place the lagging vision caught.

Again thou'rt here,
A slanting arrow sent
From yon fair-tinted bow,
In promise bent;
As when, erewhile, the gentle bird of love
Poised her white wing the new-born land above.

A seeming shade,
Scarce palpable in form,
Yet thine, alas, the change
Of calm and storm!
The veering passions of my stronger soul
Alike the throbbings of thy heart control;

For day is done,
And, cloyed of long delight,
Like me thou welcomest
The sober night,
Like me, aweary, sinkest on that breast,
That wooes all nature to her silent rest.

John B. Tabb.

THE NATIVE ELEMENT IN AMERICAN FICTION.

SINCE THE WAR.

THE war, as has already been said,* brought a change in the disposition of the intellectual forces of America — one that was to be looked for, and in many respects to be desired. Our emancipation from literary England had never been complete. Except in isolated instances, we had caught our inspiration from the mother country. While we had opened up national sources of incident, we had fashioned our treatment on the English models, and had directed our researches into material after English suggestion. We were neither, to any great extent, making an independent investigation in our new fields of character, nor perfecting any novel methods of work. Perhaps it was not to be expected that we should find a new *form*. Authorship is old, and novelty in its forms is rare enough. Suggestion passes from race to race, from nation to nation. It flashes from Greece to Italy, from Italy to France, from France to England; then from England to France and Germany, from Germany back to England, in a never-ending reciprocity: Chaucer, Milton, and Shakspere borrow from Italy; Goethe and Voltaire borrow from England; all writers resort to Greece and Rome for hint and method and material. Why should not America — even full-grown and haughty America — find an intellectual stimulus among the masters abroad?

The end of the Rebellion found us proud. Not vainglorious; that quality had been knocked out of us. We had had our days of boasting — innumerable Fourth-of-Julys, with squib and cracker and cannon to reënforce the voice of the orators; but we had been humbled in one of those bursts of providential discipline that whip a whole nation into humility. The end found us proud, but with the kind of pride which serves as the basis of character. We felt a new toughness of intellectual fiber that meant the possibility of hard work, and an exasperation with foreign indifference to the valuable element in our struggle that indicated the necessity of home work. But, meanwhile, in gaining strength, we had lost time which belonged to practical affairs, and tasks in many fields had accumulated, so that all the renewed intellectual energies must for years be given to the accomplishment of them. As for the making of imaginative literature, it was a good time to rest. Two fields of novelistic venture had been effectually shut off — the Revolution and the Indian. The Red Man had "gone West," scalp and tomahawk, never to return "in force"; while the events of the Revolution were trifles compared with those of the Rebellion. Even Washington now failed to "draw," and it would have required more than the genius of an Everett to interest the people, now *blasé* with battles and diplomacy, either in the strategy of Bunker Hill or the heroism of Valley Forge. The War of Independence, it is true, was still as important an epoch as it had ever been, and patriotism was as sweet and holy. But our new epoch was a present fact, lurid beyond description, and the new patriots were our brothers. How could we ever again see beyond them? Their story we could tell over and over again, and never exhaust its grandeur and beauty. We began at once to recount it in adventure and novel and romance. But it was still too early to attempt to idealize the men whom we knew, or to enhance by the forms of art an interest which Nature was intensifying beyond the possibilities of art.

The Puritan was still in the background — an inexhaustible source of romance and character-painting; and the Virginia cavalier of the old times had never been adequately pictured. There was room in either field for a Hawthorne or a Cooper, as romancer or as novelist. But all the conditions of the times forced the romancer out of the field and pushed the novelist in. Even before the war, we had seen these conditions accumulating. In every department of thought, men were seeking facts; and when the war was over, there had grown up a mania for facts, — the open, outward, visible facts; facts in science, facts in religion, facts in history. What we could not get at with the five senses, we doubted. It is not extravagant to say that Michael Angelo with his angels would have been asked to "explain"; that Raphael would have been held to a strict accountability for any seraphic expression in the "Madonna" that survived the friction of the nursery. Hamlet, the Dane, would have been subjected to scrutiny from the club window, and the ghost would most certainly have been pinned upon the dissection table. For we were in no mood for accepting Hamlet's conclusion that there were more things in heaven and earth than were dreamed of in our phil-

osophy. This was the spirit, already come in before the war, and which grew in the ten years following the guns of Sumter. Such a spirit must be left to justify itself. It has a fair field and able champions. We only record the fact of its existence, and note, as well as we can, how it affected the department of American fiction.

The strongest first attempt to show American life by its facts — an attempt lying among the beginnings of the new method — was that of Sylvester Judd, already described. Mrs. Stoddard and the Rev. R. T. S. Lowell, who followed, have also been touched upon. The success of the three lay in their accumulation of home material; their failure, in their inability to fashion and form it properly. They all had imagination enough for stirring pictures, but all were weak in constructive art, in compressed dramatic energy. Bayard Taylor, with his wide travel, had acquired the power of differentiating home material from foreign, and, with his genial humor, brought out the eccentricities of classes. Any one at all familiar with the internal management of the old reforms, will recognize the truth of the types in Hannah Thurston and Woodbury, among the better sort, and of Dyce, the spiritualist, and Abiram Stokes, the temperance reformer, among the worse; of the Merryfields, of Bute and Wattles and Miss Caroline Dilworth, as side-shows. But Taylor trusted too much to his inexhaustible store of oddities, and so made a broad picture of a passing phase of our life rather than a dramatic evolution of character. The value of "Hannah Thurston" as a bit of truthful local characterization has never been sufficiently acknowledged by the critics, while its defects as a work of art are plain. The life, at least, was distinctly American and local.

With Theodore Winthrop came a magnificent burst of imagination and enthusiasm. John Brent and Don Fulano, man and beast, were full of spirit and fire. The fine atmosphere, the grandeur of mountain scenery, the intensity of lofty energies, and the delicacy of lofty sentiment, were the surprise of the book. Densdeth, Cecil Dreeme, Churm, and Towner, in the New York novel, were cosmopolitan types which might as easily have walked the banks of the Thames or Seine as of the Hudson. They were full of passion, actual and terrible, and the reader has no doubt that Winthrop had taken the portraits from life, and yet he wonders continually if the author would have chosen precisely these persons if Dickens had never lived. Such suggestion is idle when we are judging of art as art, but not unnecessary when we are culling what belongs to the home production. Time would perhaps have pruned in Winthrop his excess of imagination. The personal heat which entered into his style would have worked into his heroes, and the vigor which now goes into his statement of villainy would have gone into the villains themselves and scowled from their faces. We do not want the painter to be enthusiastic, but to make us so. It is the art of the master to move the figures in this mimic show of life without exposing the hand that does it.

Passing over the few survivors of the old school, or of no school, who published but little, and the few, like Holmes, Higginson, Beecher, Robert Dale Owen, who entered the field for a moment from the more serious walks of literature and labor, but made no permanent sojourn; passing over that most genial of essayists, Donald G. Mitchell, who, in "Dr. Johns," took us into the atmosphere of New England theology, and, under cover of the old clergyman's roof, brought the *spirituelle* French frivolity under the Puritan frown, touching the austerities of New England with the fine wit and gentle culture of the best English essayists,—passing over all these, we come to the year 1870, which may conveniently mark the commencement of the new era. Before this year two or three of the new writers had made a beginning, but no more. Mrs. Spofford had written "Sir Rohan's Ghost," "The Amber Gods," and "Azarian"; Bret Harte had produced obscurely the story of "M'liss," but had not yet excited a flutter in the literary world. Neither writer was known outside of the most limited circle. To all appearances, the magazine editors were in despair for good serials, pressing hard on the lagging veterans, drumming up raw recruits in the most unpromising quarters.

It will be remembered how like a conquering hero Bret Harte came from California in the summer of 1871. An enterprising firm in Boston had caught the gleam of a new light, a new Dickens in verse and story, and with the most magnificent offers they tempted him East. His coming was like a royal progress. Almost without a hint from these enterprising wise men of the East, all flocked to welcome the new star. And the star was wonderfully luminous, equally brilliant in prose and verse. It flashed from a region little known, and yet peculiarly fascinating to the sober people of the eastern sea-board. In "'49," and later, we had sent our restlessly energetic men to the Golden Coast, and they had come straggling home, some lamed, some wrecks, and yet some rich as the famous Lydian king. Some brought home stories as incredible as those of Eldorado and the Fountain of Youth, carried to Europe

in the sixteenth century. Some came back reticent, and we could extract their stories only piecemeal, and with an accompaniment of shrugs and wry faces. The part of their lives spent in the mountains passed for a blank, and yet the remainder was not continuous with the earlier fragment. Something unaccountable had entered into their characters. A celebrated clergyman, a strict moralist, long since said he had found in traveling across the continent that one got a tendency to disrobe himself, metaphorically speaking, of those wrappings which civilization has folded about the coarser human instincts. It was this tendency which had flashed upon us as one of the possibilities of the golden atmosphere of the Sierra Nevadas; and when Bret Harte, after a sojourn of many years in the mint and mines of the mountains, told us of M'liss and Miggles, of Jim and Kentuck, and Tennessee's Partner, of Jack Hamlin and Culpepper Starbottle, of Poker Flat, Sandy Bar, Smith's Pocket, and the Wingdam Turnpike, we began to see the elements of life in their coarser forms. Here was passion both of the angelic and the demonic sort in its original, natural conditions, released from the decencies of social restraint, and subject only to the instinctive law of the heart. The material was absolutely new—a new phase of life, and every individual specialized by the novelty of the conditions. Power of contrast in characterization, skill in heightening effects, the perception of oddity, combined with a happy faculty of engrafting it upon the recognized human types, the keen sense of humor of a new sort—a kind of devil's humor suited to the diabolism of the surroundings, a tender feeling for the essential goodness of the human heart, running over with the gospel of grace into the very mouth of the pit,—these were the chief qualities of the new writer. They were all Dickensy; yet original observation, impressibility, and a fine power of imitation, had given them an individuality that was helped out by the wholly new atmosphere of the mining slopes. For the first three years, it was evident that Bret Harte was reproducing what he had seen, and had seen what he reproduced—always, of course, with a hint of his own "personal equation." The scenes and men stood out vividly, and made as distinct an impression on the mind as anything in the English novelist. The mind could trace the individual features of each person. There was in the writer the same deftness of hand which we to-day see in the Russian novelist Tourguéneff,—the power of painting a grim, strong scene in a few words. There was a kindly humor playing over the scenes, and the bright light of nature flashed upon the canvas. The author seldom missed the artistic center, as he seldom missed the happy climax of a humorous situation. However much he might lose the moralist's point of view, he was unerring as to the artist's. But he was not an analytic writer; he was as far from Henry James's methods as a man could well be. He never analyzed, or reflected, or differentiated nicely, but simply laid on color. He had seen his effects in nature, and a felicitous gift enabled him to select the fortunate pigments; a swift journalistic judgment, fearless of consequences, told him when he had done enough for his purposes, and there he stopped. But alas! the habit of bringing about a climax quickly soon became a trick, and something—was it the necessity of frequent production, or intellectual indolence, or what?—something soon left on the public the impression of an exhausted mine. Certain it is that the best things were done in these early years. As the author left California behind him, and the scenes of "'49" grew less vivid in his mind, they became less valuable as novelistic material. Yet what was already produced will always remain a vigorous, brilliant, original contribution to American romance. The style is old and yet ever new. The analytic method cannot produce the same effect. Such productions bear analysis no more than a first-rate pun. You can show in logic and in morals that Jack Hamlin and M'liss and Miggles ought not to exist; that the theory of mercy and good-will to men clearly outlined in such characters, would make suicide a daily resort among despairing fathers; but all this will not do away with the conviction of the reader that such a lawless society has existed, and that this may easily be a true picture of its mongrel features.

With Bret Harte came that burst of national romance to which allusion has already been made. One can see how sudden and diverse it was, from a mere catalogue of the new names. Mrs. Stowe and Mrs. Spofford, Mrs. Whitney and Mrs. Ann S. Stephens, Mrs. Terhune ("Marion Harland"), J. W. DeForest, and the Warner sisters, held over from an old time. Trowbridge had given some vivid war-pictures, addressed mostly to the young. Taylor produced "Joseph and his Friend" and "Beauty and the Beast," inferior to "Hannah Thurston." Dr. Holland, also holding over, but taking a new impulse from the war period, produced those popular novels, "Arthur Bonnicastle" and "Sevenoaks," the latter especially rich in material from our newly-developed vein of social and civil rascality. Mr. Belcher and Mrs. Dillingham were,

in most respects, strongly drawn and typical of a certain corner of New York life. Belcher's cold-hearted hardness with his wife, and his pursuit of that other very doubtful lady, were a home-study as good in essential character, perhaps, as the best of those ventures which have filled the magazines for two years past. Jim Fenton and the Little Tailoress were of the favorite homespun type in dialect and humor, with something of the Dickens pathos superinduced. There was much raciness, native humor, and just observation in these stories, even if the effort was too evidently didactic to be always artistically effective. All true work everywhere should play into the hands of honor and morality, should coöperate with the other forces of civilization; but all good art resents the imposition of a too formal didacticism.

Besides the above writers, Mrs. Rebecca Harding Davis contributed a decided local color in her Pennsylvania life, and a choice perception of higher elements in character. These writers all held over; but Miss Elizabeth Stuart Phelps, with "Hedged In," "The Silent Partner," and "The Story of Avis," was virtually new. Eggleston, with "The Hoosier Schoolmaster," "The End of the World," "The Mystery of Metropolisville," and "The Circuit Rider," was entirely new, and from a new region. The Rev. William M. Baker, Frederick W. Loring,—who made a handsome start in "The Two College Friends,"—James De Mille, Julian Hawthorne, General Lew Wallace, the Rev. Edward Everett Hale, Thomas Bailey Aldrich, were among the new men in fiction, each finding a more or less public welcome of various value. Of the seven writers who hold the front rank to-day in general estimation, five had their visible beginnings in the five years following 1870. The other two did their best work within this period. The beginners were, in their order, William D. Howells, with "Their Wedding Journey," "A Chance Acquaintance," "A Foregone Conclusion," and "Private Theatricals"; Henry James, Jr., with various stories, obscure work, lying half-way between essay and fiction, but showing the dawning of his art—these followed by "Roderick Hudson"; George W. Cable, with "'Sieur George," "Madame Délicieuse," and several other character stories from the Southwest; Mrs. Frances Hodgson Burnett,—then Fannie E. Hodgson,—with "Surly Tim" and many tenderly pathetic tales, showing her truest sentiment; and, lastly, Miss Constance Fenimore Woolson, with some short stories from the Northern lakes. These writers were all fostered, and won their first laurels as novelists in the magazines. To the magazines they owe much of the shaping, whether for good or evil, which their genius got. Besides these five, the two writers whom for dramatic intensity and power of passion I should place high among the seven, were Miss Phelps, in "The Story of Avis," and Mrs. Spofford, in "A Thief in the Night."

Hjalmar Hjorth Boyesen, meanwhile, brought a breezy bit of legend and crisp pastoral life from Scandinavia, continuing that delightful burrowing among the roots of old English customs which had such a charm for us in Miss Bremer. We have often had this form of romance with us, and although Boyesen's cannot be called native work, the home life in it is in spirit and quality so nearly akin to our own that it finds ready adoption among us. The author comes a little short of being finely artistic, or firm in the grasp of strong elements of character, or energetic in the expression of passion. He deals best with idyllic home scenes and the lighter play of the emotions. J. T. Trowbridge enters strongly into the same field in New England and New York life from the social and village point of view, attempting no high flights, but contented with average every-day life and manners; he gets a cue also from the war in some of his best stories. The spirit is, however, throughout genially New England in its best poetic quality. The Rev. Edward Everett Hale entered the field in its more cultivated center, and from the spiritual emotional side, conceiving a fine and lofty passion with great pureness of vision, and possessing intense projective energy, which reached its highest point in "The Man Without a Country." In this story, the loneliness engendered in a sensitive mind by the social isolation which comes from a neglected duty or a sin, is thrust upon us with a force akin to that with which Arthur Dimmesdale's moral isolation is projected upon the reader of "The Scarlet Letter." Aldrich is charming and spicy as a story-teller, with humor and with poetical sentiment. Fancy and humor back each other, and each holds the other from unnatural excesses. "Marjorie Daw," "Prudence Palfrey," and "The Queen of Sheba," possess sparkle, fun, and the true New England flavor, with more *abandon*, and with more sympathy than Howells would have displayed.

It is not my purpose in this brief essay to touch that large and important department of fiction which tempts the children as they emerge from the nursery, and which only too often attracts the graver boys and girls who studied the primers of life a generation ago. How often we wipe the gold-rimmed glasses afresh to welcome Miss Alcott, or Mrs. Mary Mapes Dodge, or Frank R. Stockton, or Horace E. Scudder, or John Habberton. Humor,

too,— which is not fiction, but a serious fact in American life,—is a department by itself, wide, deep, and rich, extending from Diedrich Knickerbocker's Creation of the World as far, at least, as Mark Twain's tearful lamentation over Adam's lonely grave. We may look at the anonymous novel with wistful eye, but for obvious reasons, we must let that, too, alone. But of the other story-tellers of various merit who belong to the last twelve years, a few may be briefly mentioned, although nothing like justice can be done to the detail of their work. Some of them are voluminous writers — dear, moreover, to the popular heart, yet coming but slightly within our field of survey, either for artistic excellence or projective power, or novelty and originality in any form. Some show only a promise of which the fulfillment lies in the future.

William M. Baker, who fails to strike deeply in character, plays vividly over the surface of many emotions. William H. Bishop works in the Howells vein, but lacks concentration, and, in roaming about for the thread of his own story, is drawn into a thousand curiosity shops. In "The House of a Merchant Prince," for instance, one feels that the author is presenting a variety show, where the spectator is called upon to note "everything by starts and nothing long"; yet it is a suggestive picture of a certain phase of New York life, with its diverse interests, its whirl of excitement, its ambitions, social and political, its rude rush for money and position. Mary Clemmer Ames is earnest, and in "Eirene" touches with skill the new chord of women's disabilities and duties. Caroline Cheseboro, with Nora Perry and Kate Putnam Osgood, are quick to catch the fancy of the young. Mrs. Lizzie W. Champney shows a quick ear for dialect, a picturesque faculty, and the power of reproducing, with the effect of documentary exactness, the spirit and features of old Revolutionary life. The Marquise Lanza, in "Mr. Perkins' Daughter," gives to Mr. Perkins some of the broad, kindly western humor to which we grew accustomed in Abraham Lincoln. General Lew Wallace, delving in the lurid passions of the South-west and beyond, makes a strong picture. De Mille is side-splitting in the sportive eccentricities of the American abroad, as Mr. Clemens is, at home as well as abroad. De Forest, in "Honest John Vane," portrays the temptations of a congressman, but is hardly at home either among the rural simplicities or the Washington duplicities. Mrs. Whitney still continues satisfied if she tells a good story and portrays girl-life well, as she always does. George Parsons Lathrop, touched by both Hawthorne and Howells, has a more natural affiliation with some of the artist-poets of the English school. A wayward poetic fancy, not at all mastered in the early novels, and only partly subdued in his best book, "An Echo of Passion," interferes too often with the naturalness of his persons. The novel above named, however, which is in the Howells vein, both in choice of subject and general treatment, shows the beginnings of original observation and a growing mastery of the real experience of life. Mr. Julian Hawthorne has no lack either of fancy or imagination. He has the creative instinct and more than the average writer's ability; but his early tendency to work in the Nathaniel Hawthorne vein seemed almost willful. It was the most difficult vein novelist ever worked; and to approach it without a tool sharpened presupposed a willingness to "square off" against the very Fates. The author puts together the elements of strong characters, invites the Destinies to take charge of them, but refuses to let go his own hold. The "Sisters Three" everywhere enter the field, only to find their work usurped by the writer. Mr. Hawthorne's latest story — the novel called "Dust" — shows a marked improvement over his earlier work. There are in it some capital scenes, and two or three admirable studies,— notably that of Philip Lancaster — a character, however, which is far better in the conception, as it appears to be detailed in Chapter X., than in the later execution.

Good story-tellers are abundant among us, and the number of sharp eyes and clever pens engaged in developing the various phases of our life for the magazines is something extraordinary. Some, like Colonel George E. Waring, Jr., and William Wallace Harney, burrow more or less among war memories, giving some of the romantic incident, with occasionally a vigorous war sketch. Some, like Sara O. Jewett, have touched out-of-the-way local scenery and customs with picturesque vigor. Some, like Joaquin Miller, Fitz-Hugh Ludlow, Charles Nordhoff, James T. Mackay, and Rose Terry Cooke, have given to local manners and customs a bit of humorous and emotional flavor. Some, like Charles de Kay, with a spice of the chivalric, are as yet stronger in the presentment of passions than in the artistic working of them. Their promise lies in their vigor of imagination, their hope in the sterner subordination of this power which comes with experience.

Mrs. Mary Hallock Foote presents in "Friend Barton's 'Concern'" a bit of lovely nature-painting and a touch of true Quaker girlhood, at once spicy and pure. In the opening chapters of "The Led-Horse Claim," she draws with charming skill and picturesque

power the approaches to the mountain scenery, and in the closing chapters, the quiet beauty and pastoral grace of "Little Rest." The presentation of Cecil, with her genuine girlish qualities, and the dialogue in the ball-room, are excellent, while the conception of the underground meeting is strong; but the shading of character in the men needs deepening, and certain occult lines in the story should be brought out more clearly in order that the imagination may follow without reluctance the line of development of the plot.

With Albion W. Tourgee came a vigorous burst of righteous wrath. His first book, "A Fool's Errand," gave the pith of a new discovery, and it seemed to be the author's one book, favored by time and circumstances. But it lacked breadth and subordination — having mainly intensity and the novelty of personal experience. It was a succession of vivid pictures of a single phase of society, with scenes of fiery passion that bore the stamp of reality. The night ride of the heroine in this story, and the river-flood and escape in "John Eax," the haughty love of Louise de Jeunette and the family pride of the De Jeunettes — all edge — mark the keen perception and the height of appreciation of passionate character; but the scenes are not well connected, and the reader cries *non sequitur* continually to the author's presentation of sequences, while the whole political discussion is already dead matter.

When we pass from this detail of the more recent writers to the authors of more national significance, we find the chief feature to be the sudden extension of area over which the interest swept. The Rebellion had upheaved the social fabric in the South, and the bottom was coming to the top. Old states of society there got an airing from within which even Mrs. Stowe could not have given, and the South and South-west began again to develop their own novelists, or to attract novelists from without. J. W. De Forest, in his Southern stories, attempted the bloody side of society there; Tourgee, the darkly passionate and political; Baker, the social and transitional. Cable, with far more poetical insight and felicity than any other Southern novelist has yet reached, made, in the Creole element of Louisiana, an absolute discovery, as quaint and peculiar in atmosphere as anything in Bret Harte, and painted with far more delicacy. At the same time, Miss Woolson had found in the North-west, about the Lakes, and higher up among the old French settlements of western Canada, a field akin to that of Lowell in Newfoundland. It is a curious thing that, within twenty years, the old French element represented in the original movement of that people up the St. Lawrence to the Lakes, and from the Lakes down the Mississippi to Louisiana, — older than the movement of the English settlers, and impinged upon most markedly at those points by the latter, — should have its chroniclers in three such kindred spirits as the Rev. Mr. Lowell, Miss Woolson, and Cable. The mixture of elements in the three quarters was peculiar. The mingling of tongues and religions was similar in all. All were frontier, and represented the conflict of races. All are now old, and present in their results the interest of quaintness. All are obscure, lying in the suburbs of history, and yielding a rich harvest to the romancer. The novelty, indeed, adds so much to our interest in the beginnings of these writers, that it is hard at first to escape the fascination sufficiently to do justice to the artistic work. The same thing may be said of Eggleston, who broke shell for lower Indiana, and first let in the light upon that Egyptian darkness. These writers, like Bret Harte, are entitled to the credit of discovery.

The new fields were worked with considerable minuteness in every case, but with varying strength. Eggleston worked with great diligence and indomitable good humor. His themes took a clerical cast, like Judd's, and, like Judd, he worked in the bottom layers of society, among the strong, coarse, and passionate people, where the motive of human improvement is religious and not social. His good people feel the need of being saved, and not of being civilized. Unlike Judd, who felt the Channing influence, which was spiritual, fine, and poetic, Eggleston felt the Beecher influence, which was sympathetic and strongly human. But he was no more a dramatist than was Judd. He could paint states of society with graphic power, could sketch character broadly with a vigorous hand; but the desire for immediate effect repeatedly tempts him from the track of a well-ordered fiction. He throws his strength into his beginnings, and the story, as a dramatic work, is always tumbling to pieces. He has reserves for spurts and a genius for strong episodes, but that is very nearly all his reserve. In "Roxy," the heroine does not grow, as she should, from the start. Nancy Kirtley is repeatedly brought upon the scene, but with no added power. There is no accumulation of interest in the characters. When they have once been introduced, they are brought in at regulation intervals to walk through their parts, which they do with a humorous show of life. We are delighted with the odd figures, with the strong human feeling, with the picturesque points, and we laugh and grow fat over the healthy sentiment and good common sense of the book; but nearly

all that a nice art and a balancing faculty would contribute is lacking.

What Eggleston was for the coarse, crude, but strong animal life of Indiana, Cable was for the proud, fast-lodged, diluvian drift of Louisiana. It was Cable's merit, as has been said, to have discovered the Creole element. In a series of striking sketches, culminating in "The Grandissimes" and "Madame Delphine," we find a most unique people, treated in a thoroughly unique manner. The treatment is worthy of the theme. It is delicate, poetical, imaginative in a high degree. In all those details of art that go to the creating of atmosphere, Cable was strong; nor did Hawthorne succeed better in producing a Puritan *aura* for the setting of Hester Prynne and Dimmesdale than Cable succeeded in getting a Creole *aura* for the working out of the impotent pride of the Grandissimes. The confused intermingling of elements in the ball-room was the natural prelude to the confusion of family relations, of family passions, and of race peculiarities. The pride of Agricola, the implacable spirit of Palmyre, the animal passion of Bras Coupé, are shown in fine relief. They are all human passions, but with a touch of the Grandissime impotency, which was not one of cold latitudes, like that in Lowell's "New Priest," but one of race decay. The finest part of the artist's work, however, is in the nice shading of character between Aurore and her daughter Clothilde. Both women are beautiful. The elements of similarity between mother and daughter are many, as they should be, but the differences are clear. Both are children in feeling and knowledge of the world. Both have a shy, natural coquetry, to which is added, in the mother, the innocent finesse born of widowhood. They have some pride and very considerable poverty, and while the latter has something to do in overcoming the former, the part played by innocent, shy love is so deftly managed that we do not miss any lady-like quality of refinement. The dialect is another excellence in Cable's work. We find in it the piquant charm of a lapse from the French rather than the lazy drawl of deteriorated English. The vocabulary is small and well utilized; a few dozen words do a good deal of service, and in the end we might tire of them; but it is a grace of the author to hold back dialect conversation except when it can be made telling. To all these artistic gifts Cable adds a stronger grasp on the fate of the story than Eggleston gets. But his poetic and antiquarian spirit leads him too often to step aside to illustrate graces of manner and fantasticalness of customs; he pauses sometimes too long to give fullness to his picture of a passing race. Like Eggleston, he lingers fondly over the novel features of his theme, perhaps with a view to their present value. This is a danger which all original discoverers must encounter. When their wealth becomes common property, they will be called to account for their management of the grand passions of human nature, which may get a hint of quaintness from deciduous fashions, but are, after all, essentially the same the world over. By their work in this enduring stuff they will be judged as novelists. "The Grandissimes" will always have the beauty of local color, the tint of a poetical conception; but perhaps it will be said that the development of dramatic action was made subordinate.

This is not likely to be said of Miss Woolson, if we may judge by her most perfect work, "Anne." Beginning, like Cable, in an unworked section of American life, still amid the diluvian drift, she advanced her action into better known regions, pursuing the beaten track of ambitious authors. The opening of her work, in various pithy and promising short stories, was full of novelties. It was a rich development of the new ore in the picturesque America. There was an antique flavor in the old mixed society of the upper lakes. As she delineates it, the life was complete, isolated, charmingly picturesque, having as much that was quaint and homespun, and yet variegated with the milder passions, as Scandinavian hill-life. All this is reproduced in the earlier chapters of "Anne," so that we have these people painted evidently by an eye-witness — their manners, customs, dialect, their mixed habits — scenes of summer and winter — the latter as charming as the best in Lowell's Newfoundland and Judd's New England. The occasional glimpses we get of the rugged outdoor sports in snow and on the ice, the Christmas festivities, the church rivalries — all indispensable features of that northern latitude, and all within the range of the author's sympathies — are good; nor does the poverty in external conditions, which lies over the whole region, preclude a wealth of warm human feeling. But having interested us thoroughly in the village life, in the two kindly old clergymen, in the thriftless Douglass and his unruly Indian family; in Aunt Lois, through whom she has her rather spicy fling at New England; in Tita, whose half-breed coquetry and full-blooded selfishness promise startling results, — having got us thoroughly interested in the drama of this unique and varied life, and in the charm of the setting of it, the writer gets her sudden ambition to take us into polite circles, and we are whisked off to New York. It must be confessed that we should go with reluctance, if we thought we were not to return to the islands of the upper lakes. But the French boarding-school and

Miss Van Horn soon reconcile us, and the plunge which the novelist presently makes into a rather indefinite and loose society offers her a chance to compete with Howells and James in the analytic methods; and here the superior tenderness of the woman's heart and the superior logic of the male mind become at once apparent. The story grows intensely dramatic and powerful—more powerful in genuine passion—an unreasoning, woman's passion, that finds a way where there is a will, than anything in the production of either of those two sober-minded gentlemen. Anne's innocence and charm and growing strength win us completely. Her honest passion for Heathcote, and the burden of her anguish in a half-foiled love, take us from our moorings. The passion is so great and so pure, that we silence our prejudices at the bidding of a woman, and go searching up and down for evidence that shall release Heathcote from jail,—where he fully deserves to pass a six months' term,—in order that he may marry the girl whose heart he has played with. This is a strong testimony to the dramatic power of the artist. She takes a man whom most of us would recognize as a heartless flirt, and almost persuades us, yielding to the woman's logic, to regard his offense as venial. Almost—not quite. Heathcote's cold impudence in carrying on two flirtations at once; his lack of good faith to one doting, though weak woman; and his lack of honor in trying to win another from her betrothed lover when the engagement has been announced to him; his almost criminal selfishness in twice putting a young girl into a doubtful position by which her good name is risked,—all under blind impulses which he does not himself call love, stamp his character so that it cannot be forgotten. Only a woman, who forgives everything to love, could forget it. With such a character we cannot, in calm judgment, accept what seems to be the author's conclusion that Heathcote goes to the war from patriotic impulses. It is *ennui*, or some lower motive than patriotism, and we accompany Anne to the wedding under mental protest, only resolved that the girl for whom we have learned to care so much, shall have the one chance left her to get that blind happiness which may come to a fond wife, even under cover of a selfish husband. The author gives us the materials for judging the man, but paints love so strongly that the argument of the heart almost overpowers that of the head. Miss Woolson, thus, to our thinking, has this double chance of becoming our best novelist—fresh material, got at first hand, and a power of passion in herself. She has, also, as has already been said, something of the analytic touch. Whether she is carried along with the drift of the times or not, she is clearly absorbing what is best in the art of the new school, without altogether sinking the old nobility of the virtues in the vulgar realities of the present day.

Quite unlike Miss Woolson is Mrs. Burnett, who yet sailed into popular favor with the gayest of banners flying. Pathos, humor, sentiment, and all the sympathies came with her first work; sprightliness, dash, vivacity, and all the coquetries followed; then the analytic fever set in and left her astray in Washington society, without a guide. Her own natural heart had at first opened the door to our feelings in their widest range. We got a tenderness at once for Joan Lowrie's proud, sensitive spirit, struggling against the brutality of its surroundings. But Joan with her drunken father, Liz with her hopeless weakness, Jud and his dog, Sammy Craddock—these types were all marked out in English fiction, especially in Dickens. The author's most tearful sentiment, moreover, fell far short of the heart-breaking pathos of Little Nell. There was but little that was new in the mining life and its low democracy. And yet in small details, like the empty dignity of the Rev. Harold Barholm, and the helpless humility of Mr. Grace, there was a fine touch; and, later on, in the startling smartness of all the women, there was an original way of looking at things. Mrs. Burnett is skillful in bringing together typical characters and balancing them against each other. She knows, too, what situations are dear to the popular heart; and, in the closing chapters of her last story, is singularly felicitous in this respect. Indeed, the air of injured innocence which Bertha Amory takes to the ball, and the big, good-natured, manly-hearted Senator Blundel's protection of her, would draw tears from a piece of Canterbury flint. But having, in her first books, touched the chord of pity once or twice in a natural manner, it soon became evident that she was forcing a pathos. Joan Lowrie was, to a person of strong feeling, a character easy to conceive. But if Louisiana wins the heart, it must surely be at the expense of justice. The old father is decidedly the more touching of the two. Louisiana's character would not bear analysis, or stand the test of probability. We do not doubt that Minerva sprang full-armed from the head of Jove, because we are sure of Jove's head—it was strong. And we do not doubt that a Louisiana might have emerged from the wilds of North Carolina and made social conquests; but we expect the author to show us the process, which, in this case, she hardly does. She gives her heroine a pretty face and a sweet heart: these often overturn a thick-witted or

a light-headed man, but do they, without other gifts, revolutionize the notions of society? All Mrs. Burnett's women, except, perhaps, Joan Lowrie and Anice Barholm, seem to be playing a part in which we should expect them to break down, did we not remember the tricks of the nerves. They are strong in excitements based on nerve force. They never forget themselves and how they look. They have a mania for dress effects, and resort frequently to the glass. In the height of our interest, we have to pause to consider a pose, or the fit of a robe, the adjustment of ribbons, the sweep of a train, the disposition of jewels — until the reader feels that if these are the secrets of female coquetry, he would rather not be initiated. He is willing to yield to the graces, but would rather continue, in his blindness, to assign them to the heart, than be enlightened, to find them made up at the toilette. The passions, under such conditions, can never be the grand passions; they must always be petty. There is too much conscious or unconscious egotism and too little real nobility of sentiment. One at first likes the smartness of Octavia Bassett in her democratic tilt against an "effete civilization"; but, in the end, one feels that, having a beltful of raw gold, she has gone to England to fling it in the faces of the nobility. The reader is delighted with the spiciness of this beautiful young woman, but the critic can scarcely give a high place in fiction to one who has nothing but a pretty face and a saucy tongue, a gold mine in the Rockies, and a trunkful of dresses fresh from Worth's. Nor can the judicious find genuine nobility in Louisiana, who has little besides a good figure and an interesting ignorance. These amiable girls may pose in all sorts of attitudes, may lay their pretty faces on the rough bark of trees, or flatten their pink cheeks on rail-fences — this is giving them coquettish airs, but not strong character. We may be deluded into loving them, but the question still remains: Will they wear?

The element of analysis that is creeping into Mrs. Burnett's later work is promising, because it shows a dissatisfaction with her former easy successes. But this method involves so great a change in her habits of thought and observation that success in it must, it would seem, be of exceedingly slow growth. To work out a train of cause and effect, to make a nice balance of relations among characters, to get into the hearts of deep men and women and disentangle their motives, requires long opportunity and the judicial faculty. With all her quick perceptions, her ready sympathy, and her direct movement on the fortress of tears,—and her intuitions in these directions are wonderfully fine,—Mrs. Burnett seems to hit but a popular and not the best ambition. She sympathizes with people in humble circumstances, not, it would seem, because they are misunderstood, or particularly unhappy in their lives, but because their surroundings are not what she herself would like. She seems to be looking for a person whom she may promote, whom she may reward for virtue or grace with money or a fine match; and yet a chance to indulge in dress or the vanities is about all such a promotion would give. A sense of value in their own lives on what must be the plane of most people, her method does not supply; and this is just what Dickens's method does. Dickens appears to be proud of human nature for the goodness there is in it,—too proud, perhaps, to minister to the vanities of mere wealth and position. Poverty is not good, and ignorance is not good; yet goodness and excellence may stay and find reward among plain people. We have in Mrs. Burnett's later heroines none of that beautiful, contented simplicity seen, for instance, in Daudet's M. Joyeuse, and in Dot and John Peerybingle in "The Cricket on the Hearth"; but it is always the restless goodness that wants to be accentuated by methods more delightful to the unreflecting than to the judicious; her ideal happiness lies not in "plain living and high thinking," but in recognition by "society."

It may be well to contrast the ideal of character as we see it in Mrs. Burnett with that of the New England school, which is represented by Miss Phelps. The opposition in these two is at the strongest. Miss Phelps is a product, like Mrs. Stowe, of Calvinistic theology, and, in mental action, is of the most bracing intellectual and moral atmosphere. But she is bold and original, having the courage not only of her opinions, but of her moods. In her first novel she startled the Puritan world by her refreshing notions of heavenly felicities. Otherwise, the picture had few striking features. It gave expression to a certain reaction within the Calvinistic circle against the hard lines of Puritan imagination. When, however, "The Story of Avis" came out, it was seen that we had an original thinker, and one who, as a novelist, was working almost wholly in the New England quarry. Avis Dobell was as fiercely characteristic of woman's mode of mental action in that section of America as George Eliot's Dorothea was of the English liberal thought of her time. The action was within the same limits sociologically,—woman, with intense aspirations, at loggerheads, between love and the requirements of love, with the

accepted notions of her "sphere." It was the woman of high ideals, with mental and moral intensity, beating against an impassive wall of cultivated selfishness—the woman scholar against the man scholar. New England, better, perhaps, than Old England, furnished a favorable arena for observing this struggle. Nowhere is the contest more marked; and Miss Phelps seized the life from the highest point of view. Avis, in her purity, is white marble; and in her passion she is white marble heated. The character is admirably drawn—beautiful in all moral qualities, weak in the presence of the housekeeper, capable of the best enthusiasms, the highest self-sacrifice, but equally capable of sour bread. In short, she has in her as much of the woman as is consistent with a good deal of the scholar. For such a person the background of professional aridities, and the social environment, with its thirst for culture subtly pervading the other thirsts, were well chosen. But the author draws only this one character. Her men are sticks, showing well on the surface—delightfully carved, but having wooden inwards. Her one woman is firm, strong, passionate, intense, conscientious, beautiful in a narrow way—the intellectual and moral outcome of the best of the followers of Calvin. But Miss Phelps could not, by any possibility, draw Howells's Marcia Hubbard. She could not get down to her, or out to her. She is, one would say, incapable of the analytic vein, and equally incapable of the realistic painting of the new school. She is, in fiction, an idealist *par excellence;* but amidst the thin naturalism of to-day, her idealism is tonic. Of artistic faults, she is full. Her poetic intensity carries her away from all the realities. She has pet words and phrases, vague enthusiasms, romantic notions of life, imagery borrowed from the Old Testament, floated down through the age of the Troubadours, and tricked out with modern botanical and geological additions. Her grandeur is sublimated, and her passion sentimentalized. Yet, for her lofty standard of womanhood and the power of self-sacrificing love, we condone all her strained metaphor, her exorbitant fancy; we forgive her such expressions as the "cool, clean-cut, conscious nails" of Avis, the "repressed excitement of a shared and unspoken experience," the "bridal gladness" and "widowed pathos of a rock," the "sentient nature of a thing adapted to its reticence," the "full, prehensile force" of a "supple touch"; and again we forgive her when she makes her heroine regard the "contour of a man's face precisely as a physician regards a hectic flush or a bilious eyeball."

"'I am afraid I am not like other women,' said Avis simply, dipping her brush with deep absorption in the madder rose.

"'Thank Heaven,' said Ostrander, in a low, delirious tone.

"Avis lifted her eyes with a startled change of expression, holding the tube of brilliant color, like an arrested thought upon the air."

She *is* unlike other women; but she is capable of enthusiasms and no meannesses, and we accept her, even while we smile at her extravagances.

A rigid art is, after all, as much needed in fiction as in other branches of work; and it is this which furnishes the strength of the two writers whose claims to the novelistic bays are now most discussed. Mr. Howells and Mr. James are artists. Their art seems almost perfect, as far as it goes, and in conscientiousness it goes as far as that of any other writer.

It is through conscientious methods that the reality of such pictures as Tourguéneff's exist; but the reality may exist only in essentials, or it may extend to the finger-points. Tourguéneff and Hawthorne touched more nearly than most others the realities of the soul. Both are perfect artists, and equally conscientious, but unequally gifted. Hawthorne held the faculty of character-drawing subordinate to that of the tragic drama. His persons burn into our minds. They are not only real to the soul,—they are terrible; yet they are so drawn that we are possessed from the beginning with their destinies, and never trouble ourselves with building up false hopes, to find bitter disappointment in the end. We find ourselves reconciled from the beginning to tragedy, as we do in the "Œdipus Tyrannus" and in "Hamlet." This is, it may be, because, much as we are interested in the persons, we are more interested in the tremendous passions of which the very Fates seem to have taken charge. We are in the atmosphere of the profoundest moral forces, and the fortunes of petty personalities are of inferior importance. With Tourguéneff it is not wholly so. He is essentially a delineator of powerful characters and the hold they have on meaner men. When he has turned them inside out, so that we understand them, he is satisfied, and drops his pen. But, as he says of himself, he is deficient in imagination. That is, he fails in cumulative interest and climax. His groups are introduced with some strong purpose which dominates their action. The purpose vanishes, and with it our interest. We have no absorbing concern in the plot or the hero. The figures are great, gaunt, stalwart, powerful, thrust forth with enormous objectivity, and finished with the utmost precision. They excite us, but they neither warm us by their loves nor kindle us by their hates. They

are repulsive. There are passionate scenes in Tourguéneff, but there is no great action. It is plain to see that the author is absorbed in the personality and its history, as he says,* and will go out of these to paint his hero's surroundings, solely with a view to illustrate him the better. This outside painting is marvelously effective; but is it anything more than the painter's imagination? The imagination of the great dramatist has a different end. He says, in effect: "Here is a remarkable event. Let us see if we can trace the gathering passions that brought it about. Let us place ourselves at the beginning, and come up to it by every road, private and public, and see if we can gather into a selected number of persons the representative forces, showing how they acted on one another, as well as how they combined to bring about the event. Let us give the local color, and revive the times as well as the men, and so make the reader an actor, and not alone a critical spectator." When the dramatist comes who can do this, we live in his creation. We laugh and cry with him. We do not applaud or hiss or criticise. We simply flash into a new life with all the passions of which we are capable. Whatever antique fashion of dress, or quaint vocabulary these men choose to adopt, they are the true realists: for their realities are both the internal and external. They paint minutely, when it is useful to do so; but they generally let one good finger-point, well touched, do for the ten. They are character painters, but they suffer the predominant traits to speak for all. They are the painters of events, for all their action converges on one point, and we are sure to see everywhere the purpose of their crusade. They are rich enough to endow their personages with all local charms. These, however, are incidental. They are realists, where realism is necessary. They are idealists, where idealism is useful. But they are alive all over, and warm with the value of life. The one quality in them which overtops all others, though it cannot do without the rest, is geniality, which, after all, comes from a healthy sense of the worth of human life in all its breadth, and implies a broad sympathy that permits no distinction of persons except by their worth. These men are not shut up in a corner of the race, have no inveterate likes and dislikes; yet they are not passionless or colorless, but capable of all colors and all passions in a deep sense.

If we judge our two cleverest writers by this standard, we find their limitations in all directions. The infinite humor of Scott, the volcanic passion of Hugo, the poetic spirit that blossoms out of the realism of Auerbach, the rollicking fun and pathos of Dickens, the poise and mastery of Thackeray,—who keeps his sanity amid the swollen dignities of Europe,—the intensity of Hawthorne, who surpasses them all in spiritual power and perception of the demonic forces in man—what one of these elements of greatness shall we find in our analytic school?

Howells and James are alike in one respect. They both feel the effect of the scientific critical spirit. Both seem inclined to deny the existence of what cannot meet the five senses. They are capable of passions only in a restricted way—grown-up passions, modified by culture, or business, or the club gossip—not the romantic passion of youth, not the steady, powerful currents which to-day float the light gondolas of love, and to-morrow carry navies of ambitious hopes. In intensity, James, perhaps, has the advantage of Howells. He can conceive a deeper character, and grasp its stronger individuality. Isabel Osmond, Madame Merle, have more of the grit of strong natures than any of Mr. Howells's persons. Ralph Touchett shows more of the best quality of pathetic humor. It is a pathos that is manly, sweet, and strong, and essentially American. The subduing effect of humor over distress is most notable in the death-bed scene between Ralph and his father. Two such quaint and grim humorists could not "shuffle off this mortal coil" without somehow finding a joke in the process. When Ralph comes to slip off the golden chain, and Isabel is a witness, the pathos masters the humor, as it should. In both qualities, however, the work is still American. These two scenes indicate, to my mind, the best of Mr. James's achievement so far, and show what he may do in those shortly coming years when the harsh acids of a somewhat cynical mood become mellow. With James, humor is closely allied to wit, and wit grew up among the acids; but with Howells, humor is evidently innate and good-natured, though not well connected. James is, in this respect, half a foreigner, or with a foreign taint, or—some would perhaps prefer to call it—tint, while Howells has the flavor of Ohio, which is lately modifying in a more intellectual atmosphere. Howells, one would say, is utterly without pathos. James, in spite of Ralph Touchett, shows but little, and that little he is half ashamed of. Neither has much original sentiment, and what there was has been largely reduced by their peculiar processes of education. Yet James is the most capable of projecting a sentiment, or the most willing to do it. When he has projected it, however, he seems to shrink from his work, and to pare it down so carefully that we recognize it, at last, only as an intel-

* See THE CENTURY MAGAZINE for June, 1877.

ectual, not a heart passion; that is, it ceases to be another person's passion, and is one modified by the author's own feelings. The character of love, for instance, is firm enough and persistent; but it is undemonstrative, cold, reserved, New Englandish. Who can imagine one of James's heroines loving as Anne loved Heathcote? Warburton's love is brotherly; Caspar Goodwood's is business-like and protective—at its highest, it belongs to his temper and granitic will; Isabel's is fascination and fate, always at odds with itself. There is no consuming quality anywhere in any of the lovers. James is not, to my thinking, objective; he is essentially subjective; that is, he imparts to every person a portion of himself and his own caution and causticity. The strongest evidence of this I find in the dialogue in "The Portrait of a Lady," a novel which I choose as his culminating work, representing the outcome thus far of all his tendencies. There is in nearly every person an observable infusion of the author's personality. The men and women are almost equally quick-witted, curt, and sharp. While each has a certain amount of individuality, the sharpness is one of the elements in common, preventing a complete differentiation. It is not wit alone and repartee, but a sub-acid quality which sets the persons to criticising each other. One does not like to call it snarling. Mr. James is too much of a gentleman to admit snarling among ladies and gentlemen; and yet every leading person in the book does, in a polite way, enter frequently into a form of personal criticism of somebody else. The poor heroine gets criticised—mildly and politely, but none the less surely, by every one: by Ralph Touchett, by Caspar Goodwood, by Lord Warburton, as well as by her husband, Osmond, and her friend Henrietta Stackpole. The minute analysis for which Mr. James is famous enters also into the dialogue, which, indeed, is invented apparently only to give variety to the form of analysis. The speakers are too obviously engaged in the business of helping the author develop his characters. They question mutually with a view to elucidating one another's business or character. All conversation gets the personal element; and when they are not personal, the individuals are introspective. They analyze themselves, until the reader acquires the feeling that they are all morbidly self-conscious. If the continuity of individuality is kept up through the dialogue, it is because of this original similarity in the persons. The projection by the author is never complete. It may be that Mr. James has not yet produced that one novel which is the largest outcome of an author's experience; but we cannot escape the conviction that he has at least so far written himself into his books that a shrewd critic could reconstruct him from them. The person thus fashioned would be one of fine intellectual powers, incapable of meannesses; of fastidious tastes, and of limited sympathies; a man, in short, of passions refined away by the intellect.

Howells, almost equally with James, is bound in by his limitations; but they are of a different kind. He is more genial and less caustic; has more tolerance, but not, perhaps, larger sympathies. He has the tolerance of the journalist, to whom the shows of life are a matter of curiosity, but not vital to himself. We cannot imagine him hating or loving his *dramatis personæ*. He would undoubtedly like a smoke with Judge Gaylord in his office, or would sit on a log and chat with Kinney. He has a high respect for Atherton, and would certainly offer him a cigar; but he neither loves nor hates with warmth the creatures of his fancy. Nor is it easy to assign this lack of sympathy, as perhaps some would be inclined to do, to any theory as to the novelist's duty as a reporter of human life; for there is more than enough of a subjective relation between the author and his persons in the minor qualities to prevent our classing him with the rare men like Shakspere, who can be at once indifferent and yet searching observers of human life. It seems far more reasonable to suppose that his persons are almost wholly the creatures of his note-book. He has seen them walking up and down the stations, and perhaps set down their peculiarities. They are exteriorly life-like, finished with extreme minuteness,—for it is a wonderful note-book, so full, so accurate, so genially playful, that we cannot get away from it. The external and some of the more obvious internal marks of our daily life we recognize as both typical and individual. The persons are nevertheless constructions, and in no large sense creations. They do not come from the heart, but through the senses; and we are so tied down by what they do visibly that we never find underlying strata—either because Mr. Howells cannot discover deep natures for them, or because he is afraid to trust to his insight. His method is not that of Tourguéneff, far less that of Hawthorne. He is of the analytic school, but analyzes by the externals,—which in his case are generally petty,—and argues back to motives, which are consequently thin. But his work grows deeper every year, and in the last novel, "A Modern Instance," he begins to show some confidence in his powers of insight. As a strong character in underworking motive, Squire Gaylord seems

to be his best. For manly passion,—real passion, that stirs us deeply,— Halleck is the most consistent construction and the most deeply marked. All the other passions are trifling and fretful. Marcia has a narrow faithfulness and persistency, but no heroic quality. Hubbard has weaknesses, but no villainy. He simply falls, without any Satanic propulsion to help his fall. If it is not Mr. Howells's distrust of himself which restrains him from great attempts, it certainly cannot be dearth of material in New England. There is iron in the blood of the race there if anywhere, —iron in their loves and iron in their hates.

James has affiliations and aversions which we see at their strongest in Ralph Touchett and Gilbert Osmond. But he, too, like Mr. Howells, has no strong loves nor hates. Both writers, however, have attained a wonderful success in reproducing what they see and feel. The superficial aspect of American life each has, in his own line of observation, depicted with fascinating skill. The average American abroad—neither the highest nor the lowest, but with features which we must recognize, whether we like them or not, as the product of our system of education, government, and social life—has never been so well presented as in James's list of characters, from Daisy Miller to Henrietta Stackpole, from Caspar Goodwood to Mr. Newman. This is a field by itself, and the author has shown himself a master in it; still his mastery lies in his analysis of externals, not in sympathetic reproduction of heroic qualities. He never gets into the spirit of our American home-life. When, by some exertion, he *seems* to get home, it is only, as in the story of "The Europeans," in the rank suburbs that we find him. The life of the American abroad is clearly one without community duties, and so too apt to be one without community sympathies. It has an income of enjoyment which implies the outgo of money merely, and not of heart, and the heart may fail at last to respond to the deeper human woes, or the finer human joys. Not to invest any feeling in community life is not to find the center of the life; and this is the attitude, possibly, which most readers perceive in James's books. They are admirable studies of American manners as evolved in travel, that is, in contact with foreign manners, and of American limitations judged by a foreign standard; but they fail, it seems to me, to reach the spirit of home life or of any settled life. The reader finds harsh lines where he knows soft ones exist. Felix, in Boston, in early spring, "kept looking at the *violent* blue of the sky, at the scintillating air, at the scattered and multiplied patches of color"—as if the clean and chaste blue of the April skies we know could be "violent," except to one who was homesick, and so incapable of just judgment. Again, to the same sort of eyes, in the same season, "the *coarse*, *vivid* grass and the slender tree-boles were gilded by the level sunbeams—gilded as with gold that was fresh from the mines." One feels that this is not the natural objective treatment by a rich mind, but that, while seeming to be objective, it is in reality subjectively unsympathetic; that is, it is the negative side of subjectivity which excludes what the mood cannot appreciate.

In literary form James is elegant and finished, but he is far more pleasing, it seems to me, in his essay style than in his dialogue, which is constructed on a dry—perhaps a French—pattern, where precision becomes bareness,—an almost wearisome *staccato* that has wit enough, but is slim in large action and devoid of warmth and life-like quality, as we may see if we compare it with almost any dialogue in Scott, Thackeray, Dickens, Cooper, or Mrs. Stowe. It is bare, even when compared with Mr. Howells's dialogue, of everything except intellectual keenness. We miss the rich coloring which a man of vivid imagination and large sympathy would put in, and we get little besides the intellectual effort of the speakers. That this is bright no one will venture to deny. It is excessively bright; but it is of that "violent" order of brightness, unsoftened, unwarmed, of which James is a master.

So far, then, as the writers of the last decade have made progress, the progress has been in the direction of more precise observation and report, which is necessary work, and at the bottom of all growth. This report, as I have tried to show, has been of every sort of value. With some it has had for its aim the reproduction of eccentricities, oddities, peculiarities—external and trifling, which make us laugh, but otherwise do not impress us deeply. In others it is of traits which are local and deciduous. The reportorial method is affecting the younger writers. Some are content with reporting, without observing; some observe, without discriminating, and report in mass. They have no rule in their work, no principles of judging, no artistic sense in grouping material. Some report with a bias toward the sentimental, or the cynical, or the humorous. But reporting is a work of externals, and so far it seems to have developed variety in manners and customs mainly, and to have been confined to those who have little more than the reportorial instinct. It is something, however, that this has brought about a greater desire for accuracy. Here the analytical school has come in, but thus far without the more serviceable results. It surely is

not desirable, for instance, that life should be made to seem less attractive than it is. Some of us do not filch from the public treasury, or have confused notions of ownership in our neighbor's ox, or his ass, or his servants, or his wife. Some of us are not dyspeptic. There is a tolerably healthy action of the liver. When we look out upon the earth, it is still beautiful—still God's earth. Spring blossoms continue to suggest the luxuriance of the coming summer, and not always the decay of the last autumn. "I am shocked, sometimes," says Charles Lamb, "at the shape of my own fingers, not for their resemblance to the ape tribe (which is something), but for the exquisite adaptation of them to the purposes of picking, fingering, etc." Do we not all recognize the risk of too much contemplation of the fingers? Some kind power—perhaps it is the energetic action of society—keeps them, in the main, to legitimate uses. There is a value in morbid analysis, when not made too publicly; but we show our diseases to the physician, not to the world; and the world is none the worse, even if it is none the wiser. It often enough becomes the office of science to prick a dangerous superstition; but life and love, hope and aspiration, and human sympathy, the true science recognizes as no superstitions, but the only sane facts. Science has its reverential, as well as its dyspeptic devotees, and the former show us the beauty of order and law; they teach us the inspiration of the universe, and let us live without the constant presence of the thought that the golden orbs eventually resolve themselves into gases. It surely is an unhealthy corner of science that stops with the processes of dissolution. The nobler finds in decay the elements of new growth, and does not limit our hopes with the resolution of our molecules.

Is the new novelist to take his stand with the healthy livers, or with the dyspeptic? Is he only to analyze down to the dissolution, and deny us our dreams? We find, even in the most persistent of the analytic school, some promise of higher ends. Their efforts hitherto in rebuilding have been mainly tentative. They are perhaps trying their powers. So far they have shown us the follies of American life; and, if they have touched the virtues, it has been only to show how thin they are conceived to be. If these writers are to find the good, they must at least be in sympathy with what is good among us. They cannot live at the club, or in the parlor, or confine their observation to the way-stations, or be deterred by the crudeness of externals which belongs to a new country. A life which has mastered a continent and developed its enormous resources, which has handled successfully so much of the capital of Europe, which has freed a nation of slaves and already partly digested a small empire of the difficult subjects of European mismanagement, which has survived a war of almost incredibly disintegrating properties, and which yet finds itself no worse in the blood than England was eighteen years after Waterloo—such a life is rich enough to meet the largest demands of the novelist. America has much to learn from Europe. We cannot greatly boast abroad of ease and elegance in social life, of art and learning, of fine culture and manners; but of variety and movement, of free action and growth, of that satisfaction that comes from being alive all over, we have enough and to spare. Life here is not thin, except to the thin. When our Thackeray or Scott comes, with the right grasp, he will certainly find character in individual and group, variety in social life, and that change and ferment which give the largest scope to the novelist. The play of elementary forces among us, in a wide arena of action, is at least as great as that of any nation in Europe. If the novelist wants villains, we have taught the world only too many tricks; if he wants virtues, and fails to find them in the history of the last twenty-five years, he will look for them in vain elsewhere. If he seeks diversity in situation, or novelty in adventure, or the action and reaction of intense social forces, he will find them here if anywhere. Our six or seven generations have seen many historical changes, and a great interplay of the telluric passions. Our past is as much a region of mystery, as little subject to the sharp eye of historical research, as full of legend and unwritten song and story, as that section of the English past which her recent novelists have cared to cultivate. What can be made of it in a corner, has been shown by Hawthorne. What can be found in its details is indicated by Bret Harte and Cable and Miss Woolson. What we do need is the man who can grasp all these details, and out of them create the men and women who shall represent what is best and bravest in human nature, clothed in the new garments of the national life. It is the very great merit of Henry James that he has tried honestly to do this in his way; but he has yet to convince us that he has a genuine sympathy with the chief underlying motive of American institutions, which is, as we understand it, not to make life lovely for the few, but to make generous action and honest growth possible for the many—even at the expense, if necessary, of some self-sacrifice on the part of the few.

James Herbert Morse.

BLACK BASS FISHING.

"A GLORIOUS morning for fishing!" said the Professor, as he stepped down from the broad veranda of a stately Kentucky mansion, and out upon the lawn, dashing the dewdrops from the newly sprung blue-grass as he leisurely strode along in his heavy wading boots.

Professor Silvanus was a man yet in the prime of life, with a full beard, dark gray eyes, and a tall, powerful frame. A well-informed naturalist, a capital shot, and an artistic angler, he had wooed Nature in her various moods, in all seasons, and in many lands. Facing the east, he now stood, clad in a quiet fishing suit of gray tweed, surmounted by a broad-brimmed hat of drab felt, the smoke from his briar-root pipe wreathing gracefully above his head like a halo before it was borne away on the early morning air.

Meanwhile, Ignatius, his companion and disciple, was busily engaged in bringing out to the veranda the rods, creels, tackle-cases, landing-nets, lunch-basket, and other necessaries for a day's fishing.

"Luke is coming with the wagon, Professor," said he, as a well-groomed span of bays to a light wagonette came dashing around the corner of the house.

After depositing the various articles in the wagon, Ignatius took the reins, the Professor climbed up beside him with the rod-cases, while the colored man Luke, with a sigh, gave up the ribbons and took a back seat.

The sun was just topping the maples when the impatient team went dashing through the road-gate.

"The bass should rise well to-day," said the Professor.

"They are well through spawning, and if the water is right, everything else is propitious," replied Ignatius.

"Mighty perfishus for chan'l cats, too," put in Luke, "'sides yaller bass an' green bass an' black bass, too; any kind o' bass."

"Professor, how many kinds of black bass are there?" inquired Ignatius, as he lightly touched up the flank of the off-horse.

"There are but two species of black bass, and they are as much alike as that span of horses; but from the many different names used to designate them in different parts of the country one would be led to think there were many species."

"Local fishermen say there are three kinds here, — black, yellow, and green bass," asserted Ignatius.

"There are but two well-defined species, the large-mouthed bass and the small-mouthed bass," continued the Professor, settling himself for a lecture. "There has been more confusion and uncertainty attending the scientific classification and nomenclature of the black bass than usually falls to the lot of fishes, some dozen generic appellations and nearly fifty specific titles having been bestowed upon the two species by naturalists since their first scientific descriptions by Count Lacépède in 1802. Nor has this polyonomous feature been confined to their scientific terminology, for their vernacular names have been as numerous and varied; thus they are known in different sections of our country as bass, perch, trout, chub, or salmon, with or without various qualifying adjectives descriptive of color or habits."

"Yes," assented Ignatius, "I have heard them called black perch, yellow perch, and jumping perch up the Rockcastle and Cumberland rivers, and white and black trout in Tennessee."

"Exactly," returned the Professor. "Much of the confusion attending the common names of the black bass arises from the coloration of the species, which varies greatly, even in the same waters; thus they are known as black, green, yellow, and spotted bass. Then they have received names somewhat descriptive of their habitat, as, lake, river, marsh, pond, slough, bayou, moss, grass, and Oswego bass. Other names have been conferred on account of their pugnacity or voracity, as, tiger, bull, sow, and buck bass. In the Southern States they are universally known as 'trout.' In portions of Virginia they are called chub, southern chub, or Roanoke chub. In North and South Carolina they are variously known as trout, trout-perch, or Welshman; indeed, the large-mouthed bass received its first scientific, specific name from a drawing and description of a Carolina bass sent to Lacépède under the local name of trout, or trout-perch, who accordingly named it *salmoides*, meaning trout-like, or salmon-like."

"How do you account for the ridiculous practice of applying such names as trout and salmon to a spiny-finned fish of the order of perches?" asked Ignatius.

"They were first given, I think, by the early English settlers of Virginia and the

"BROKE AWAY." (FROM THE PAINTING BY GURDON TRUMBULL, ESQ., BY PERMISSION OF KNOEDLER & CO.)

Carolinas, who, finding the bass a game fish of high degree, naturally gave it the names of those game fishes *par excellence* of England, when they found that neither the salmon nor the trout inhabited southern waters. In the same way the misnomers of quail, partridge, pheasant, and rabbit have been applied, there being no true species of any of these indigenous to America."

"Then, I should say the names are a virtual acknowledgment that they considered the black bass the peer of either the trout or salmon as a game fish," said Ignatius.

"As an old salmon and trout fisher," replied the Professor, "I consider the black bass, all things being equal, the gamiest fish that swims. Of course, I mean as compared to fish of equal weight, and when fished for with the same tackle, for it would be folly to compare a three-pound bass to a twenty-pound salmon."

"The long list of local names applied to the black bass," resumed the Professor, "is owing chiefly to its remarkably wide geographical range; for while it is peculiarly an American fish, the original habitat of one or other of its forms embraces the hydrographic basins of the great lakes, the St. Lawrence Mississippi, and Rio Grande rivers, and the entire water-shed of the South Atlantic States from Virginia to Florida; or, in other words, portions of Canada and Mexico, and the whole United States east of the Rocky Mountains, except New England and the sea-board of the Middle States. Of late years it has been introduced into these latter States, into the Pacific slope, England, and Germany."

Reaching the summit of a hill after a long but gentle ascent, the river was disclosed to the view of the expectant anglers. At the foot of the descent was an old covered bridge which spanned a somewhat narrow but beautiful stream, winding in graceful curves among green hills and broad meadows. The ripples, or "riffles," sparkled and flashed as they reflected the rays of the bright morning sun, while the blue and white and gray of the sky and clouds were revealed in the still reaches and quiet pools as in a mirror. Driving through the time-worn and old-fashioned bridge with its quaint echoes, our friends left the turnpike and proceeded down a narrow road, following the course of the river to a small grove of gigantic elms, beeches,

and sycamores, where a merry little creek mingled its limpid waters with the larger, but more pellucid stream.

While Luke unharnessed the horses and haltered them to the low limb of a beech, the Professor and Ignatius went up the creek, with the minnow-seine and bucket, and soon secured a supply of chubs and shiners for bait. The Professor then took from its case and put together a willowy and well made split bamboo fly-rod, eleven feet long, and weighing just eight ounces. Adjusting a light, German-silver click reel, holding thirty yards of waterproofed and polished fly-line of braided silk, to the reel-seat at the extreme butt of the rod, he rove the line through the guide-rings, and made fast to it a silkworm-gut leader six feet in length, to the end of which he looped, for a stretcher or tail-fly, what is known, technically, as the "polka," with scarlet body, red hackle, brown and white tail, and wings of the spotted feathers of the guinea-fowl; three feet above this, he looped on for dropper or bob-fly a "Lord Baltimore," with orange body, black wings, hackle and tail, and upper wings of jungle-cock, both very killing flies, and a cast admirably suited to the state of the water and atmosphere.

Meanwhile, Ignatius, who was a bait-fisher, jointed up an ash and lancewood rod of the same weight as the Professor's, but only eight and a quarter feet in length, and withal somewhat stiffer and more springy. He then affixed a fine multiplying reel, holding fifty yards of the smallest braided silk line, to which, after reeving through the rod-guides, he attached a sproat hook, No. 1½, with a gut snell eight inches long, but without swivel or sinker, for he intended fishing the "riffles," which is surface fishing, principally.

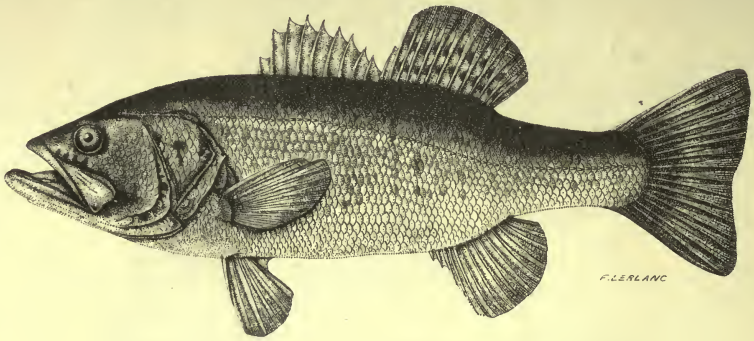
Slinging their creels and landing-nets, they were about to depart, when Luke spoke up:

"Mars' Nash, will you please, sah, gib me one ob dem sproach hooks I heerd you all talkin' 'bout las' night; mebbe so I'll hang a big chan'l cat w'ile you're gone."

Ignatius, who was fastening the strap of a small, oblong, four-quart minnow-bucket to his belt, gave him several large-sized sproat hooks, saying:

"There, Luke, you will not fail to hook him with one of these, and the Professor will guarantee it to hold any fish in the river."

"Right," affirmed he; "the sproat is the hook beyond compare, the *ne plus ultra*, the perfection of fish-hooks in shank, bend, barb, and point."



LARGE-MOUTHED BLACK BASS — MICROPTERUS SALMOIDES. (LACÉPÈDE.)

While the Professor and Ignatius proceeded down the river, Luke rigged up a stout line the length of his big cane pole, a large red and green float, a heavy sinker, and one of the No. 3–0 sproat hooks. He then turned over the stones in the creek until he obtained a dozen large craw-fish, which were about to shed their outer cases, or shells, and which for this reason are called "shedders," or "peelers."

"Now, den," said he, "we'll see who'll ketch de mos' fish. Umph! I wunder wat de 'Fessor do if he hang a big chan'l cat wid dat little pole!"

He then baited his hook with a "soft craw," seated himself on a log at the edge of a deep pool, or "cat-hole," and began fishing.

The Professor and Ignatius took their way down-stream a short distance to where a submerged ledge of rocks ran nearly across the river, some two feet below the surface and about ten feet in width. The line of rock was shelving, or hollow underneath on the up-river side, the water being some six feet deep just under and above it, but shoaling, gradually, up-stream. The ledge was surmounted on its lower edge by a line of loose rocks, which cropped up nearly to the surface, producing a rapid, or riffle. On the opposite side of the stream, the bank was quite high and steep, forming a rocky, wooded cliff, where the snowy dogwood blossoms and the

pink tassels of the redbud lit up the dark mass of foliage which was yet in shadow: for the sun was just peeping curiously over the top of the cliff, and shining full in their faces —for prudent anglers always fish toward the sun, so that their shadows are cast behind them.

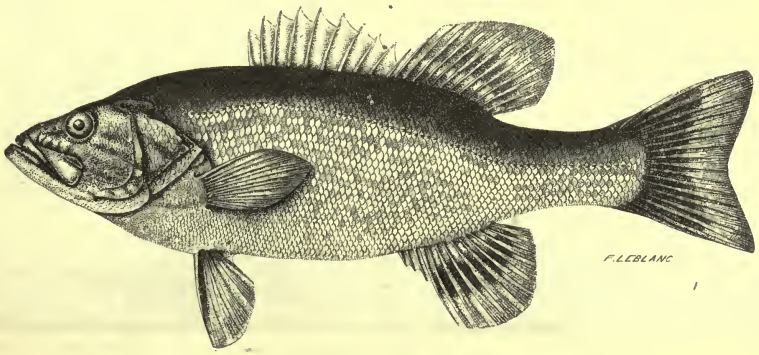
"Now," said the Professor, as he waded out into the stream some fifty feet above the rocky ledge, "the bass have left the cool depths beside the rock and are on the riffle, or just below it, enjoying the welcome rays of the sun while waiting for a stray minnow or craw-fish for breakfast. I'll drop them a line."

So saying, he began casting, lengthening his line at each cast,—the line, leader, and flies following the impulse of the flexible rod in graceful curves, now projected forward, now unfolding behind him,—until the flies, almost touching the water full seventy feet in his rear, were, by a slight turn of the wrist and fore-arm and apparently without an effort, cast a like distance in front, where they dropped gently and without the least splash just on the lower edge of the rift. Immediately the swirl of a bass was seen near the dropper fly; the Professor struck lightly, but missed it, for he was taken somewhat unawares and failed to strike quickly enough. Throwing his line behind him, he made another cast, the flies dropping, if possible, more lightly than before, and with a somewhat straighter and tighter line.

"I have him!" he exclaimed, as a bass rose and snapped the stretcher fly before it fully settled on the water. "He hooked himself that time, the line being perfectly taut. He's not a large one, though he gives good play," he continued, as he took the rod in his left hand and applied his right to the reel, the bass, in the meantime, having headed up-stream to the deeper water beside the rock.

"No, no, my fine fellow, that will never do," said he, as he brought the full strain of the fish on the rod by turning the latter over his shoulder and advancing the butt toward the struggling bass, which had made a desperate and quick dash to get under the rock when he found himself in deep water. This "giving the butt," as it is technically termed, brought him to the surface again, when he instantly changed his tactics by springing two feet into the air, shaking his head violently in the endeavor to dislodge the hook, and as he fell back with a loud splash he dropped upon the line, by which maneuver he would have succeeded in tearing out the hook had the line still been taut; but the Professor was perfectly familiar with this trick, and had slackened the line by lowering the tip of the rod as the bass fell back, but instantly resumed its tension by again raising the tip when the fish regained his element. As the Professor slowly reeled the line, the bass dashed hither and yon at the end of his tether, but all the time working up-stream and toward the rod. Then he was suddenly seized by an impulse to make for the bottom, to hide under a rock, or mayhap dislodge the barb or foul the line by nosing against a stone or snag—but not to sulk; for be it known a black bass never sulks, as the salmon does, by settling motionless and stubbornly on the bottom when he finds his efforts to escape are foiled. The bass resists and struggles to the last gasp, unless he can wedge himself beneath a rock or among the weeds, where he will work the hook out at his leisure. The Professor, keeping the line constantly taut and the rod well up, thereby maintaining a springy arch, soon reeled the bass within a few feet, when he put the landing-net under him. Then addressing Ignatius, he said:

"The humane angler always kills his fish as soon as caught by severing the spinal



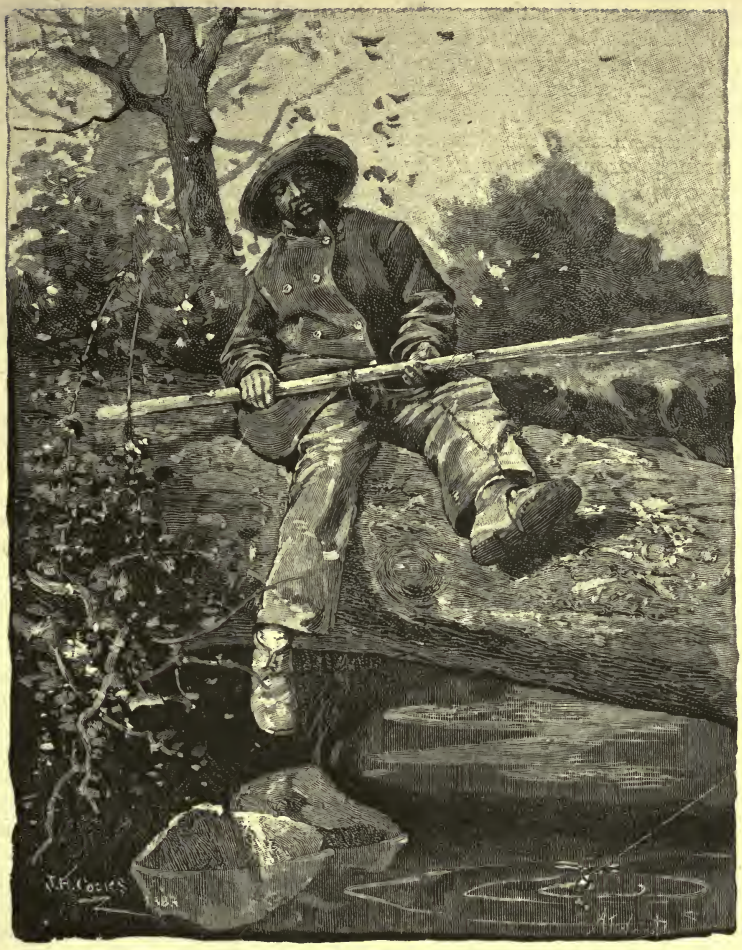
SMALL-MOUTHED BLACK BASS — MICROPTERUS DOLOMIEU. (LACÉPÈDE.)

LANDING A DOUBLE.

cord at the neck with a sharp-pointed knife, by breaking the neck, or by a smart blow on the head. Then raising the gill-cover, he bleeds the fish by puncturing a large venous sinus, which shows as a dark space nearly opposite the pectoral fin. Killing and bleeding a fish is not only a merciful act, but it enhances its value for the table, rendering the flesh firmer, sweeter, and of better color;" and suiting the action to the word, he killed and bled the fish and put it in his creel.

Ignatius was capable of admiring the Professor's humanity, but he was most attracted by his wonderful skill. His grace and deliberation, though natural and inborn to a certain degree, were chiefly the result of many years' devotion to the rod and gun and the practical study of the habits of fish and game. There is more symmetry of form and natural grace of motion among the aboriginal races of the world, trained to the pursuit of animals on land and water from childhood, than among the civilized and enlightened; our brains are developed and fostered at the expense of our bodies; therefore, the nervous, jerky, impatient, and impetuous man will never make a truly successful angler nor a really good shot, though he may attain to a certain mediocrity in both sports.

At the next cast the Professor fastened a two-pound bass to the "polka," and while giving him play another bass of the same



AN IDEAL "STILL FISHER."

weight took the "Lord Baltimore." As these fish kept down-stream, the full force of the current was an additional factor of resistance to the rod, which seemed to Ignatius to bend nearly double, and caused him to say:

"You will have a hard time to land them both, Professor!"

"Not necessarily, for although the weight is greater, they, together, will not play much longer than a single fish, if so long; for they are pulling against each other. It only remains for me to hold them by the spring of the rod and let them fight it out."

His method of landing them was unique: Holding the net a few inches beneath the surface, he first drew in the bass on the stretcher-fly; then, as he turned up the lower or down-river half of the net-rim to the surface, he let the bass on the bob-fly drop back with the current into it, and lifted out both.

Ignatius proceeded farther out into the stream, but parallel with the shelving rock. Then selecting a minnow four inches long, he passed the hook through the lower lip and out at the nostril. Reeling up his line to the snell of the hook, and with his thumb on the spool of the reel, he turned his left side to the riffle below; then swinging his rod to the right, the minnow nearly touching the water, he made a sweeping cast from right to left and from below upward, starting the minnow on its flight just before the tip of the rod reached its greatest elevation, by relaxing somewhat the pressure of his thumb on the spool, but still maintaining a certain light and uniform pressure to prevent the reel from back-lashing and the line from overrunning; the minnow was neatly cast, in this way, some seventy-five feet, and just beyond the riffle. Then he reeled slowly, keeping the minnow near the surface (there being no sinker), and just as it was passing through the broken water of the riffle, a bass

seized it on the run and continued his rush up-stream toward deep water. Ignatius reeled his line rapidly until he felt the weight of the fish, which then gave a short tug or two, when he was allowed to take a few feet of line, though grudgingly and sparingly, so as to keep it taut. Ignatius then, feeling the bass pull steadily and strongly, drove in the steel by a simple turning over of the rod-hand, while drawing firmly on the line; this set the hook. It takes but a slight motion of the wrist to hook a fish with a taut line and pliant rod.

The bass continued his race by swimming rapidly between Ignatius and the shore and then up the river, describing a half circle, the line being the radius; for Ignatius held him firmly by the spring of the rod, yielding the line only inch by inch when forced to do so. The bass, finding his progress thus stayed, sprang clear of the water several times in quick succession; but Ignatius, instead of slackening the line, skillfully turned the bass over in the air by a slightly increased tension as it left the water, thus preventing, by another method, his falling across the taut line. This latter mode requires more adroitness than the plan used by the Professor, of lowering the tip of the rod to slacken the line as the fish falls back, but it can be more successfully and safely accomplished with the shorter and stiffer minnow-rod than with the fly-rod. The bass was sooner exhausted and brought to creel than if he had been down-stream, not having the strength of the current to aid him.

"That is the best fish yet taken, Ignatius," said the Professor; "he will scale fully three pounds, and you landed him in about two minutes. If he had remained down-stream, it would have taken a minute longer to kill him."

"One should hold hard and kill quick."

"With a qualification as to the rod, that is the true principle," returned the Professor. "With a properly made, light, and flexible rod, yes; with a bean-pole, no. With a well balanced, supple rod of eight ounces, a pound bass, even in swift water, can be easily killed in a minute, and one of five pounds in five minutes. With extremely light and willowy rods it takes much longer to kill a fair-sized fish than genuine sportsmanship will warrant."

The Professor and Ignatius, having each taken a dozen bass, reeled up their lines and retraced their steps toward the wagon for luncheon. Turning a bend in the river, they came in sight of Luke, still sitting on the log with a firm hold on the rod, but sound asleep.

"Behold the ideal still-fisher!" observed the Professor.

Suddenly the float disappeared, the point of the rod was violently pulled into the water, and Luke, awakening, took in the situation, and with a savage jerk, that would have thrown a smaller fish over his head, struck a large fish which threatened to pull him from his perch. Indeed, he was forced to follow it into the water to save his tackle.

Luke, seeing them approaching, cried out appealingly:

"Wat I gwine to do wid dis fish?"

"Keep your pole up, and lead him out to the shallow water on your left."

Finally, after a few minutes more of great effort, and much floundering of the fish, and Luke's stumbling over the slippery rocks, he succeeded in getting the fish into shallow water, and drew it out on the shore, a channel cat-fish, weighing fully ten pounds.

"I got de boss green bass, too, Mars' Nash," said he, as he drew his fish-string out of the water and displayed a large-mouthed bass of four pounds.

"And the only large-mouthed bass caught this morning," said the Professor. "Now, Ignatius," he continued, "lay it side by side with your heaviest small-mouthed bass, and you will readily see the principal points of difference. In the first place, Luke's fish is more robust, or 'chunkier,' yours being more shapely and lengthy. Then Luke's bass has much the larger mouth, its angle reaching considerably beyond or behind the eye, while in yours it scarcely reaches the middle of the eye; thus it is they are called large and small-mouthed bass. Then the scales of Luke's fish are much larger than those of yours, for if you count them along the lateral line you will find only about sixty-five scales from the head to the minute scales at the base of the caudal fin, while there are about seventy-five on either of your small-mouthed bass. You also observe that the scales on the cheeks of Luke's fish are not much smaller than those on its sides, while on your fish the cheek scales are quite minute as compared with those on its body.

"As for Luke's big-mouthed bass," continued the Professor, "I've taken them in Florida weighing about fourteen pounds. I used a ten-ounce rod for those big fellows; all the same, I could have killed them with this little rod by taking more time and muscle, and uselessly prolonging the struggles of the fish, but I deem that unsportsmanlike."

"I've heard," said Ignatius, "that most of the Florida bass are taken with the hand-line and trolling-spoon."

"That is the way most Northern tourists usually take them, because they don't know how to handle a rod; and then, the necessary tackle for hand-trolling can be carried in the pocket. It is the simplest mode of angling, if it can be dignified by that name, for it is more suggestive of meat, or 'pot,' than sport.

The pseudo-angler sits in the stern of a boat with a stout line, nearly the size of an ordinary lead-pencil and about seventy-five yards long, to the end of which is attached a spoon-bait or trolling-spoon, with one or two small swivels. The boatman rows the boat slowly and quietly along the edges of the saw-grass, water-lettuce, bonnets, or other aquatic plants which border the fresh-water streams and lakes of Florida. The trolling-spoon, revolving swiftly beneath the surface at the end of fifty yards of line, glittering and flashing in the sunlight, is eagerly seized by the bass as it passes near his lair, when one or more of the hooks attached to the spoon are fixed in his jaws. The black bass has an irresistible impulse to snap at any brightly colored or shining object in motion, whether spoon-bait, bone squid, or other like lure; indeed, thousands are taken each winter in Florida waters by simply trolling with a hand-line and a bit of white or red rag affixed to a hook. While there is a certain amount of excitement in hauling in the struggling bass by 'main strength and stupidity,' as the mule pulls, there is not the faintest resemblance to sport, as the term is understood by the true angler, for there is no skill required in the manipulation of the line or bait or in handling the fish when hooked."

"Do the Floridians troll with the hand-line, too?" asked Ignatius.

"Not many of them; they use a long rod or pole for still-fishing, skittering, and bobbing."

"What are skittering and bobbing?"

"They are methods of fishing only adapted to the sluggish, weedy waters of the Gulf States, where they prove wonderfully successful. Bobbing has been practiced in Florida for more than a century, and is a very simple but remarkably "killing" method of fishing. The tackle consists of a long cane or wooden rod, two or three feet of stout line, and the 'bob,' which is formed by tying three hooks together, back to back, and covering their shanks with a portion of a deer's tail, somewhat on the order of a colossal hackle-fly; strips of red flannel or red feathers are sometimes added; altogether forming a kind of tassel, with the points of the hooks projecting at equal distances. The man using the bob is seated in the bow of a boat, which the boatman poles or paddles silently and slowly along the borders of the stream or lake, when the fisher, holding the long rod in front of him so that the bob is a few inches above the surface, allows it to dip or 'bob' at frequent intervals in the water, among the lily-pads, deer-tongue, and other aquatic plants that grow so luxuriantly in that sub-tropical region. The bass frequently jumps clear of the water to grab the bob, but usually takes it when it is dipped or trailed on the surface. Deer hair is, as you know, very buoyant, and the queer-looking bob seems like a huge, grotesque insect, flying or skimming along the clear, still waters.

"Skittering," continued the Professor, "is practiced with a strong line about the length of the rod, to which is affixed a small trolling-spoon, a minnow, or a piece of pork-rind cut in the rude semblance of a small fish. The boat is poled along, as in 'bobbing,' but farther out in the stream, when the angler, standing in the bow, 'skitters' or skips the spoon or bait over the surface just at the edge of the weeds. Skittering is a more legitimate method of angling than bobbing, for with the longer line the bass gives considerable play before he can be taken into the boat; and as this manner of fishing is usually done in shallow waters abounding in moss, grass, and weeds, the fish must be kept on the surface and landed quickly. It is, all things considered, pretty fair sport, which might be enhanced by occasionally hooking a small alligator, as I once saw done.

"Ignatius, you should become a fly-fisher," added the Professor. "Your style of bait-fishing is admirably suited to the Northern lakes and the deep rivers, where, indeed, it is much practiced, and is the favorite method with the best anglers, though a small swivel or sinker is necessary to keep the minnow beneath the surface. But on such a charming, rapid, and romantic river as this, the artificial fly alone should be used to lure the gamy bass. This afternoon, when the sun is low in the west, bass will again rise to the fly, and if you like we will try them again."

And now, while the Professor and Ignatius are talking of other matters over their pipes, we will conclude by wishing "good luck" to the entire fraternity of anglers, from him of the æsthetic fly to him of the humble worm, but with a mental reservation as to him of the hand-line and spoon.

James A. Henshall.

ANTHONY TROLLOPE.

[DRAWN BY R. BIRCH, AFTER A PHOTOGRAPH BY SARONY.]

ANTHONY TROLLOPE.

When, a few months ago, Anthony Trollope laid down his pen for the last time, it was a sign of the complete extinction of that group of admirable writers who, in England, during the preceding half-century, had done so much to elevate the art of the novelist. The author of "The Warden," of "Barchester Towers," of "Framley Parsonage," does not, to our mind, stand on the very same level as Dickens, Thackeray, and George Eliot; for his talent was of a quality less fine than theirs. But he belonged to the same family—he had as much to tell us about English life; he was strong, genial, and abundant. He published too much; the writing of novels had ended by becoming, with him, a perceptibly mechanical process. Dickens was prolific; Thackeray produced with a freedom for which we are constantly grateful; but we feel that these writers had their periods of gestation. They took more time to look at their subject; relatively (for to-day there is not much leisure, at best, for those who undertake to entertain a hungry public) they were able to wait for inspiration. Trollope's fecundity was prodigious; there was no limit to the work he was ready to do. It is not unjust to say that he sacrificed quality to quantity. Abundance, certainly, is in itself a great merit; almost all the greatest writers have been abundant. But Trollope's fertility was fantastic, incredible; he himself contended, we believe, that he had given to the world a greater number of printed pages of fiction than any of his literary contemporaries. Not only did his novels follow each other without visible intermission, overlapping and treading on each other's heels, but most of these works are of extraordinary length. "Orley Farm," "Can You Forgive Her?" "He Knew He Was Right," are exceedingly voluminous tales. "The Way We Live Now" is one of the longest of modern novels. Trollope produced, moreover, in the intervals of larger labor, a great number of short stories, many of them charming, as well as various books of travel and two or three biographies. He was the great improvvisatore of these latter years. Two distinguished story-tellers of the other sex—one in France and one in England—have shown an extraordinary facility of composition; but Trollope's pace was brisker even than that of the wonderful Madame Sand and the delightful Mrs. Oliphant. He had taught himself to keep this pace, and had reduced his admirable faculty to a habit. Every day of his life he wrote a certain number of pages of his current tale, a number sacramental and invariable, independent of mood and place. It was once the fortune of the author of these lines to cross the Atlantic in his company, and he has never forgotten the magnificent example of stiff persistence which it was in the power of the eminent novelist to give on that occasion. The season was unpropitious, the vessel overcrowded, the voyage detestable; but Trollope shut himself up in his cabin every morning for a purpose which, on the part of a distinguished writer who was also an invulnerable sailor, could only be communion with the muse. He drove his pen as steadily on the tumbling ocean as in Montague Square; and as his voyages were many it was his practice before sailing to come down to the ship and confer with the carpenter, who was instructed to rig up a rough writing-table in his small sea-chamber. Trollope has been accused of being deficient in imagination, but in the face of such a fact as that the charge will scarcely seem just. The power to shut one's eyes, one's ears (to say nothing of another sense) upon the scenery of a pitching Cunarder and open them upon the loves and sorrows of Lily Dale, or the conjugal embarrassments of Lady Glencora Palliser, is certainly a faculty which has an element of the magical. The imagination that Trollope possessed he had, at least, thoroughly at his command. I speak of all this in order to explain (in part) why it was that, with his extraordinary gift, there was always in him a certain touch of the common. He abused his gift, overworked it, rode his horse too hard. As an artist he never took himself seriously; many people will say this was why he was so delightful. The people who take themselves seriously are prigs and bores; and Trollope, with his perpetual story, which was the only thing he cared about, his strong good sense, hearty good nature, generous appreciation of life in all its varieties, responds in perfection to a certain English ideal. According to that ideal it is rather dangerous to be definitely or consciously an artist—to have a system, a doctrine, a form. Trollope, from the first, went in, as they say, for having as little form as possible; it is probably safe to affirm that he had no "views" whatever on the subject of novel-writing. His whole manner is that of a man who regards the practice as one of the

more delicate industries, but has never troubled his head nor clogged his pen with theories about the nature of his business. Fortunately he was not obliged to do so, for he had an easy road to success; and his honest, familiar, deliberate way of treating his readers as if he were one of them and shared their indifference to a general view, their limitations of knowledge, their love of a comfortable ending, endeared him to many persons in England and America. It is in the name of some chosen form that, of late years, things have been made most disagreeable for the novel-reader, who has been treated by several votaries of the new experiments in fiction to unwonted and bewildering sensations. With Trollope we were always safe; there were sure to be no new experiments.

His great, his inestimable merit was a complete appreciation of reality. This gift is not rare in the annals of English fiction; it would naturally be found in a walk of literature in which the feminine mind has labored so fruitfully. Women are delicate and patient observers; they hold their noses close, as it were, to the texture of life. They feel and perceive the real (as well as the desirable), and their observations are recorded in a thousand delightful volumes. Trollope, therefore, with his eyes comfortably fixed on the familiar, the actual, was far from having invented a *genre*, as the French say; his great distinction is that, in resting there, his vision took in so much of the field. And then he *felt* all common, human things as well as saw them; felt them in a simple, direct, salubrious way, with their sadness, their gladness, their charm, their comicality, all their obvious and measurable meanings. He never wearied of the preëstablished round of English customs—never needed a respite or a change—was content to go on indefinitely watching the life that surrounded him and holding up his mirror to it. Into this mirror the public, at first especially, grew very fond of looking—for it saw itself reflected in all the most credible and supposable ways, with that curiosity that people feel to know how they look when they are represented "just as they are" by a painter who does not desire to put them into an attitude, to drape them for an effect, to arrange his light and his accessories. This exact and on the whole agreeable image, projected upon a surface without a strong intrinsic tone, constitutes mainly the entertainment that Trollope offered his readers. The striking thing to the critic was that his robust and patient mind had no particular bias, his imagination no light of its own. He saw things neither pictorially and grotesquely like Dickens; nor with that combined disposition to satire and to literary form which gives such "body," as they say of wine, to the manner of Thackeray; nor with anything of the philosophic, the transcendental cast—the desire to follow them to their remote relations—which we associate with the name of George Eliot. Trollope had his element of fancy, of satire, of irony; but these qualities were not very highly developed, and he walked mainly by the light of his good sense, his clear, direct vision of the things that lay nearest, and his great natural kindness. There is something remarkably tender and friendly in his feeling about all human perplexities; he takes the good-natured, moderate, conciliatory view—the humorous view, perhaps, for the most part, yet without a touch of mockery or cynicism. As he grew older, and had sometimes to go further afield for his subjects, he acquired a savor of bitterness and reconciled himself sturdily to treating of the disagreeable. A more copious record of disagreeable things could scarcely be imagined, for instance, than "The Way We Live Now." But, in general, he has a wholesome mistrust of morbid analysis, an aversion to inflicting pain. He has an infinite love of detail, but his details are, for the most part, the innumerable items of the familiar. When the French are disposed to pay a compliment to the English mind, they are so good as to say that there is in it something remarkably *honnête*. If I might borrow this epithet without seeming to be patronizing, I should apply it to the genius of Anthony Trollope. He represents in an eminent degree this natural decorum of the English spirit, and represents it all the better that there is not in him a grain of the mawkish or the prudish. He writes, he feels, he judges like a man, talking plainly and frankly about many things, and is by no means destitute of a certain saving grace of coarseness. But he has kept the purity of his imagination, and held fast to old-fashioned reverences and preferences. He thinks it a sufficient objection to several topics to say simply that they are unclean. There was nothing in his theory of the story-teller's art that tended to convert the reader's or the writer's mind into a vessel for polluting things. He recognized the right of the vessel to protest, and would have regarded such a protest as conclusive. With a considerable turn for satire, though this, perhaps, is more evident in his early novels than in his later ones, he had as little as possible of the quality of irony. He never played with a subject, never juggled with the sympathies or the credulity of his reader, was never in the least paradoxical or mystifying. He sat down to his theme in a serious, business-like way, with

his elbows on the table and his eye occasionally wandering to the clock.

To touch successively upon these points is to attempt a portrait, which I shall perhaps not altogether have failed to produce. The source of his success in describing the things that lay nearest to him, and describing them without any of those artistic perversions that come, as we have said, from a powerful imagination, from a cynical humor, or from a desire to look, as George Eliot expresses it, for the suppressed transitions that unite all contrasts, the essence of this love of reality was his extreme interest in character. This is the fine and admirable quality in Trollope, this is what will preserve his best things in spite of those deficiencies which keep him from standing on quite the same level as the masters. Indeed, this quality is so much one of the finest (to my mind at least) that it makes me wonder the more that the writer who had it so abundantly and so naturally should not have just that distinction which Trollope lacks and which we find in his three brilliant contemporaries. If he was in any degree a man of genius (and I hold that he was), it was in virtue of this happy, instinctive perception of character. His knowledge of human nature, his observation of the common behavior of men and women, was not reasoned, nor acquired, not even particularly studied. All human doings deeply interested him. Human life, to his mind, was a perpetual story; but he never attempted to take the so-called scientific view, the view which has lately found ingenious advocates among the countrymen and successors of Balzac. He had no airs of being able to tell you *why* people in a given situation would conduct themselves in a particular way; it was enough for him that he felt their feelings and struck the right note, because he had, as it were, a good ear. If he was a knowing psychologist, he was so by grace; he was just and true without apparatus and without effort. He must have had a great taste for morals; he evidently believed that such things are the basis of the interest of fiction. We must be careful, of course, in attributing convictions and opinions to Trollope, who, as I have said, had as little as possible of the pedantry of his art, and whose occasional chance utterances in regard to the object of the novelist and his means of achieving it are of an almost startling simplicity. But we certainly do not go too far in saying that he gave his practical testimony in favor of the idea that the interest of a work of fiction is great in proportion as the people stand on their feet. His great effort was evidently to make them stand so; if he achieved this result by the quietest and most unpretending touches, it was nevertheless the measure of his success. If he had taken sides on the rather superficial opposition between novels of character and novels of plot, I can imagine him to have said (except that he never expressed himself in epigrams) that he preferred the former class, inasmuch as character in itself is plot, while plot is by no means character. It is more safe indeed to believe that his great good sense would have prevented him from taking an idle controversy seriously. Character, in any sense in which we can get at it, is action, and action is plot, and any plot which hangs together, even if it pretend to interest us only in the fashion of a Chinese puzzle, plays upon our emotion, our suspense, by means of personal tones. We care what happens to people only in proportion as we know what people are. Trollope's great apprehension of the real, which was what made him so interesting, came to him through his desire to satisfy us on this point — to tell us what certain people were and what they did in consequence of being so. That is the purpose of each of his tales; and if these things produce an illusion, it comes from the gradual abundance of his testimony as to the temper, the tone, the passions, the habits, the moral nature, of a certain number of contemporary Britons.

His stories, in spite of their great length, deal very little in the unusual, the unexpected, the complicated; as a general thing, he has no great story to tell. The thing is not so much a story as a picture; we hesitate to call it a picture only, because the author gives us an impression of not possessing in any appreciable degree that temperament which is known as the artistic. There is not even, as a general thing, much description, in the sense which the present votaries of realism in France attach to that word. The author lays his scene in a few deliberate, not especially pictorial strokes, and never dreams of finishing the piece for the sake of enabling the reader to hang it up. The finish, such as it is, comes later, from the slow, gradual, sometimes rather heavy accumulation of small incidents. These incidents are sometimes of the smallest; Trollope turns them out inexhaustibly, repeats them freely, unfolds them without haste and without rest. But they are all of the most homogeneous sort, and they are none the worse for that. The point to be made is that they have no great spectacular interest (we beg pardon of innumerable love-affairs that Trollope has described) like many of the incidents, say, of Walter Scott and of Alexandre Dumas: if we care to know about them (as repetitions of a familiar case), it is because the author has managed, in his solid, definite,

somewhat lumbering way, to tell us that about the men and women concerned which has already excited on their behalf the impression of life. It is a marvel by what homely arts, by what plain persistence, Trollope contrives to excite this impression. Take, for example, such a work as "The Vicar of Bullhampton." It would be difficult to give the *donnée* of this slow but excellent story, which is a capital example of interest produced by the quietest conceivable means. The principal persons in it are a lively, jovial, high-tempered country clergyman, a young woman who is in love with her cousin, and a small, rather dull squire, who is in love with the young woman. There is no connection between the affairs of the clergyman and those of the two other persons, save that these two are the Vicar's friends. The Vicar gives countenance, for Christian charity's sake, to a young countryman, who is suspected (falsely, as it appears) of murder, and also to the lad's sister, who is more than suspected of leading an immoral life. Various people are shocked at his indiscretion, but in the end he is shown to have been no worse a clergyman because he is a good fellow. A cantankerous nobleman, who has a spite against him, causes a Methodist conventicle to be erected at the gates of the vicarage; but afterward, finding that he has no title to the land used for this obnoxious purpose, causes the conventicle to be pulled down, and is reconciled with the parson, who accepts an invitation to stay at the castle. Mary Lowther, the heroine of "The Vicar of Bullhampton," is sought in marriage by Mr. Harry Gilmore, to whose passion she is unable to respond; she accepts him, however, making him understand that she does not love him and that her affections are fixed upon her kinsman, Captain Marrable, whom she would marry (and who would marry her) if he were not too poor to support a wife. If Mr. Gilmore will take her on these terms, she will become his spouse; but she gives him all sorts of warnings. They are not superfluous; for, as Captain Marrable presently inherits a fortune, she throws over Mr. Gilmore, who retires to foreign lands, heart-broken, inconsolable. This is the substance of "The Vicar of Bullhampton"; the reader will see that it is not a very tangled skein. But if the interest is quiet, it is extreme and constant, and it comes altogether from excellent portraiture. It is essentially a moral interest. There is something masterly in the steadiness and certainty with which, in work of this kind, Trollope handles his brush. The Vicar's nature is thoroughly understood and expressed, and his monotonous friend the Squire, a man with limitations, as the phrase is, but possessed and consumed by a genuine passion, is equally near to truth.

Trollope has described again and again the ravages of love, and it is wonderful to see how well, in these delicate matters, his plain good sense and good taste serve him. His story is always primarily a love-story, and a love-story constructed on an inveterate system. There is a young lady who has two lovers, or a young man who has two sweethearts; we are treated to the innumerable forms in which this dilemma may present itself and the consequences, sometimes pathetic, sometimes grotesque, which spring from such false situations. Trollope is not what is called a colorist; still less is he a poet. He is seated on the back of heavy-footed prose. But his account of those sentiments which the poets are supposed to have made their own is apt to be as touching as demonstrations more lyrical. There is something wonderfully vivid in the state of mind of the unfortunate Harry Gilmore, of whom I have just spoken; and his history, which has no more pretensions to style than if it were cut out of yesterday's newspaper, lodges itself in the imagination in all sorts of classic company. He is not handsome, nor clever, nor rich, nor romantic, nor distinguished in any way; he is simply a rather dull, narrow-minded, stiff, obstinate, common-place, conscientious modern Englishman, exceedingly in love and, from his own point of view, exceedingly ill-used. He is interesting because he suffers, and because we are curious to see the form that suffering will take in that particular nature. Our good fortune, with Trollope, is that the person put before us will have a certain particular nature. The author has cared enough about the character of such a person to find out exactly what it is. Another particular nature in "The Vicar of Bullhampton" is the surly, sturdy, skeptical old farmer Jacob Brattle, who doesn't want to be patronized by the parson, and in his dumb, dusky, half-brutal, half-spiritual melancholy, surrounded by domestic troubles, financial embarrassments, and a puzzling world, declines altogether to be won over to clerical optimism. Such a figure as Jacob Brattle, purely episodical though it be, is an excellent English portrait. As thoroughly English, and the most striking thing in the book, is the combination, in the nature of Frank Fenwick — the delightful Vicar — of the patronizing, conventional, clerical element, with all sorts of manliness and spontaneity; the union or, to a certain extent, the contradiction of official and personal geniality. Trollope touches these points in a way that shows that he knows his man. Delicacy is not his great sign; but

when it is necessary he can be as delicate as anyone else.

I alighted, just now, at a venture, upon the history of Frank Fenwick; it is far from being a conspicuous work in the immense list of Trollope's novels. But, to choose an example, one must choose arbitrarily; for examples of almost anything that one may wish to say are numerous to embarrassment. In speaking of a writer who produced so much and produced always in the same way, there is perhaps a certain unfairness in choosing at all. As no work has higher pretensions than any other, there may be a certain unkindness in holding an individual production up to the light. "Judge me in the lump," we can imagine the author saying; "I have only undertaken to entertain the British public. I don't pretend that each of my novels is an organic whole." Trollope had no time to give his tales a classic roundness; yet there is (in spite of an extraordinary defect) something of that quality in the thing that first revealed him. "The Warden" was published in 1855. It made a great impression; and when, in 1857, "Barchester Towers" followed it, every one saw that English literature had a novelist the more. These were not the works of a young man, for Anthony Trollope had been born in 1815. It is remarkable to reflect, by the way, that his prodigious fecundity (he had published before "The Warden" three or four novels which attracted little attention) was inclosed between his fortieth and his sixty-seventh year. Trollope had lived long enough in the world to learn a good deal about it; and his maturity of feeling and evidently large knowledge of English life were for much in the impression produced by the two clerical tales. It was easy to see that he would be a novelist of weight. What he knew, to begin with, was the clergy of the Church of England, and the manners and feelings that prevail in cathedral towns. This, for a while, was his specialty, and, as always happens in such cases, the public was disposed to prescribe to him that path. He knew about bishops, archdeacons, prebendaries, precentors, and about their wives and daughters; he knew what these dignitaries say to each other when they are collected together, aloof from secular ears. He even knew what sort of talk goes on between a bishop and a bishop's lady when the august couple are enshrouded in the privacy of the episcopal bedroom. This knowledge, somehow, was rare and precious. No one, as yet, had been bold enough to snatch the illuminating torch from the very summit of the altar. Trollope enlarged his field very speedily. There is, as I remember that work, as little as possible of the ecclesiastical in the tale of "The Three Clerks," which came after "Barchester Towers." But he always retained traces of his early observation of the clergy; he introduced them frequently, and he always did them easily and well. There is no ecclesiastical figure, however, so good as the first — no creation of this sort so happy as the admirable Mr. Harding. "The Warden" is an excellent little story, and a signal instance of Trollope's habit of offering us the spectacle of a character. A motive more delicate, more slender, as well as more charming, could scarcely be conceived. It is simply the history of an old man's conscience.

The good and gentle Mr. Harding, precentor of Barchester Cathedral, also holds the post of warden of Hiram's Hospital, an ancient charity, where twelve old paupers are maintained in comfort. The office is in the gift of the bishop, and its emoluments are as handsome as the labor of the place is small. Mr. Harding has for years drawn his salary in quiet gratitude; but his moral repose is broken by hearing it at last begun to be said that the wardenship is a sinecure, that the salary is a scandal, and that a large part, at least, of his easy income ought to go to the pensioners of the hospital. He is sadly troubled and perplexed, and when the great London newspapers take up the affair he is overwhelmed with confusion and shame. He thinks the newspapers are right — he perceives that the warden is an overpaid and a rather useless functionary. The only thing he can do is to resign the place. He has no means of his own — he is only a quiet, modest, innocent old man, with a taste, a passion, for old church music and the violoncello. But he determines to resign, and he does resign in spite of the sharp opposition of his friends. He does what he thinks right, and goes to live in lodgings over a shop in the Barchester high-street. That is all the story, and it has exceeding beauty. The question of Mr. Harding's resignation becomes a drama, and we anxiously wait for the catastrophe. Trollope never did anything happier than the picture of this sweet and serious little old gentleman, who on most of the occasions of life has shown a lamblike softness and compliance, but in this particular matter opposes a silent, impenetrable obstinacy to the urgency of the friends who insist on his keeping his sinecure — fixing his mild, detached gaze on the distance and making imaginary passes with his fiddle-bow while they demonstrate his pusillanimity. The subject of "The Warden," exactly viewed, is the opposition of the two natures of Archdeacon Grantley and Mr. Harding, and there is nothing finer in all

Trollope than the vividness with which this opposition is presented. The archdeacon is as happy a portrait as the precentor—an image of the full-fed, worldly churchman, taking his stand squarely upon his rich temporalities, and regarding the church frankly as a fat social pasturage. It required the greatest tact and temperance to make the picture of Archdeacon Grantley stop just where it does. The type, impartially considered, is detestable, but the individual may be full of amenity. Trollope allows his archdeacon all the virtues he was likely to possess, but he makes his spiritual grossness wonderfully natural. No charge of exaggeration is possible, for we are made to feel that he is conscientious as well as arrogant, and comfortable as well as hard. He is one of those figures that spring into being all at once, and solidify in the author's grasp. These two capital portraits are what we carry away from "The Warden," which some persons profess to regard as the author's masterpiece. We remember, while it was still something of a novelty, to have heard a judicious critic say that it had much of the charm of "The Vicar of Wakefield." Anthony Trollope would not have accepted this compliment, and would not have wished this little tale to pass before several of its successors. He would have said, very justly, that it gives too small a measure of his knowledge of life. It has, however, a certain classic roundness, though, as we said a moment since, there is a blemish on its fair face. The chapter on Dr. Pessimist Anticant and Mr. Sentiment would be a mistake almost inconceivable, if Trollope had not in other places taken pains to show us that for certain forms of satire (the more violent, doubtless), he had absolutely no gift. Dr. Anticant is a parody of Carlyle, and Mr. Sentiment is an exposure of Dickens; and both these little *jeux d'esprit* are as infelicitous as they are misplaced. It was no less luckless an inspiration to convert Archdeacon Grantley's three sons, denominated respectively Charles James, Henry, and Samuel, into little effigies of three distinguished English bishops of that period, whose well-known peculiarities are reproduced in the description of these unnatural urchins. The whole passage, as we meet it, is a sudden disillusionment; we are transported from the mellow atmosphere of an assimilated Barchester to the air of unsuccessful allegory.

I may take occasion to remark here upon a very curious fact—the fact that there are certain precautions in the way of producing that illusion dear to the intending novelist which Trollope not only habitually scorned to take, but really, as we may say, asking pardon for the heat of the thing, delighted wantonly to violate. He took a suicidal satisfaction in reminding the reader that the story he was telling was only, after all, a make-believe. He habitually referred to the work in hand (in the course of that work) as a novel and to himself as a novelist, and was fond of letting the reader know that this novelist could direct the course of events according to his pleasure. Already, in "Barchester Towers," he falls into this pernicious trick. In describing the wooing of Eleanor Bold by Mr. Arabin, he has occasion to say that the lady might have acted in a much more direct and natural way than the way he attributes to her. But if she had, he adds, "where would have been my novel?" The last chapter of the same story begins with the remark, "The end of a novel, like the end of a children's dinner party, must be made up of sweetmeats and sugar-plums." These little slaps at credulity (we might give many more specimens) are very discouraging, but they are even more inexplicable; for they are deliberately inartistic, even judged from the point of view of that rather vague consideration of form which is the only canon we have a right to impose upon Trollope. It is impossible to imagine what a novelist takes himself to be, unless he regard himself as an historian and his narrative as a history. It is only as an historian that he has the smallest *locus standi*. As a narrator of fictitious events, he is nowhere; to insert into his attempt a back-bone of logic, he must relate events that are assumed to be real. This assumption permeates, animates all the work of the most solid story-tellers; we need only mention (to select a single instance) the magnificent historical tone of Balzac, who would as soon have thought of admitting to the reader that he was deceiving him as Garrick or John Kemble would have thought of pulling off his disguise in front of the foot-lights. Therefore, when Trollope suddenly winks at us and reminds us that he is telling us an arbitrary thing, we are startled and shocked in quite the same way as if Macaulay or Motley were to drop the historic mask and intimate that William of Orange was a myth or the Duke of Alva an invention.

It is a part of this same ambiguity of mind as to what constitutes evidence that Trollope should sometimes endow his people with such fantastic names. Dr. Pessimist Anticant and Mr. Sentiment make, as we have seen, an awkward appearance in a modern novel; and Mr. Neversay Die, Mr. Stickatit, Mr. Rerechild and Mr. Fillgrave (the two last the family physicians) are scarcely more felicitous. It would be better to go back to Bunyan at once. There is a person mentioned in "The Warden" under the name of Mr. Quiverful—a

poor clergyman, with a dozen children, who holds the living of Puddingdale. This name is a humorous allusion to his overflowing nursery, and it matters little so long as he is not brought to the front. But in "Barchester Towers," which carries on the history of Hiram's Hospital, Mr. Quiverful becomes, as a candidate for Mr. Harding's vacant place, an important element, and the reader is made proportionately unhappy by the primitive character of this satiric note. A Mr. Quiverful, with fourteen children (which is the number attained in "Barchester Towers") is too difficult to believe in. We can believe in the name, and we can believe in the children; but we cannot manage the combination. It is probably not unfair to say that if Trollope derived half his inspiration from life he derived the other half from Thackeray; his earlier novels, in especial, suggest an honorable emulation of the author of "The Newcomes." Thackeray's names were perfect; they always had a meaning, and (except in his absolutely jocose productions, where they were still admirable) we can imagine, even when they are most expressive, that they should have been borne by real people. But in this, as in other respects, Trollope's hand was heavier than his master's; though, when he is content not to be too comical, his appellations are sometimes fortunate enough. Mrs. Proudie is excellent for Mrs. Proudie, and even the Duke of Omnium and Gatherum Castle rather minister to illusion than destroy it. Indeed, the names of houses and places, throughout Trollope, are full of color.

I would speak in some detail of "Barchester Towers" if this did not seem to commit me to the prodigious task of appreciating each of Trollope's works in succession. Such an attempt as that is so far from being possible, that I must frankly confess to not having read everything that proceeded from his pen. There came a moment in his vigorous career (it was even a good many years ago) when I renounced the effort to "keep up" with him. It ceased to seem obligatory to have read his last story; it ceased soon to be very possible to know which was his last. Before that, I had been punctual, devoted; and the memories of the earlier period are delightful. It reached, if I remember correctly, to about the publication of "He Knew He Was Right"; after which, to my recollection (oddly enough, too, for that novel was good enough to encourage a continuance of past favors, as the shop-keepers say), the picture becomes dim and blurred. The author of "Orley Farm" and "The Small House at Allington" ceased to produce individual works; his activity became one huge "serial." Here and there, in the vast fluidity, a more compact mass detached itself. "The Last Chronicle of Barset," for instance, is one of his most powerful things; it contains the sequel of the terrible history of Mr. Crawley, the starving curate—an episode full of that absolutely truthful pathos of which Trollope was so often a master, and which occasionally raised him quite to the level of his two immediate predecessors in the vivid treatment of English life—great artists whose pathetic effects were sometimes too visibly prepared. For the most part, however, he should be judged by the productions of the first half of his career; later, the strong wine was rather too copiously watered. His practice, his acquired facility, were such, that his hand went of itself, as it were, and the thing looked superficially like a fresh inspiration. But it was not fresh, it was rather stale; and though there was no appearance of effort, there was a fatal dryness of texture. It was too little of a new story and too much of an old one. Some of these ultimate compositions—"Phineas Redux" ("Phineas Finn" is much better) "The Prime Minister," "John Caldigate," "The American Senator," "The Duke's Children"—have the strangest mechanical movement. What stands Trollope always in good stead (in addition to the ripe habit of writing) is his various knowledge of the English world—to say nothing of his occasionally laying under contribution the American. His American portraits, by the way (they are several in number), are always friendly; they hit it off more happily than the attempt to depict American character from the European point of view is accustomed to do: though indeed, as we ourselves have not yet learned to represent our types very finely,—are not apparently even very sure what our types are,—it is perhaps not to be wondered at that transatlantic talent should miss the mark. The weakness of transatlantic talent, in this particular, is apt to be want of knowledge; but Trollope's knowledge has all the air of being excellent, though not intimate. Had he indeed striven to learn the way to the American heart? No less than twice and, possibly, even oftener has he rewarded the merit of a scion of the British aristocracy with the hand of an American girl. The American girl was destined sooner or later to make her entrance into British fiction, and Trollope's treatment of this complicated being is full of good humor and of that fatherly indulgence, that almost motherly sympathy, which characterizes his attitude throughout toward the youthful-feminine. He has not mastered all the springs of her delicate organism, nor sounded all the mysteries of her conversation. Indeed, as regards

these latter phenomena, he has observed a few of which he has been the sole observer. "I got to be thinking if any one of them should ask me to marry him," words attributed to Miss Boncassen, in "The Duke's Children," have much more the note of English-American than of American-English. But, on the whole, in these matters Trollope does very well. His fund of acquaintance with his own country — and, indeed, with the world at large — was apparently inexhaustible, and it gives his novels an airy, spacious quality which we should not know where to look for elsewhere in the same degree, and which is the sign of an extraordinary difference between such an horizon as his and the limited world-outlook, as the Germans would say, of the brilliant writers who practice the art of realistic fiction on the other side of the Channel. Trollope was familiar with all sorts and orders of men, with the business of life, with affairs, with the great world of sport, with every component part of the ancient fabric of English society. He had traveled all over the globe (more than once, we believe), and for him, therefore, the background of the human drama was a very extensive scene. He had none of the pedantry of the cosmopolite; he remained a sturdy and sensible middle-class Englishman. But his work is full of implied reference to the whole arena of modern energy. He was for many years concerned in the management of the Post-office; and we can imagine no experience more fitted to impress a man with the diversity of human relations. It is possibly from this source that he derived his fondness for transcribing the letters of his love-lorn maidens and other embarrassed persons. No contemporary story-teller deals so much in letters; the modern English epistle (very happily imitated, for the most part) is his unfailing resource.

There is perhaps little reason in it, but I find myself comparing this tone of allusion to many lands and many things, and whatever it brings us of easier respiration, with that narrow vision of humanity which accompanies the strenuous, serious work lately offered us in such abundance by the votaries of art for art who sit so long at their desks on Parisian *quatrièmes*. The contrast is complete, and it would be interesting, had we space to do so here, to see how far it goes. On one side a wide, good-humored, superficial glance at a good many things; on the other a gimlet-like consideration of a few. Trollope's plan, as well as Zola's, was to describe the life that lay near him; but the two writers differ immensely as to what constitutes life and what constitutes nearness. For Trollope the emotions of a nursery-governess in Australia would take precedence of the adventures of a depraved countess in Paris or London. They both undertake to do the same thing — to depict French and English manners; but the English writer (with his unsurpassed industry) is so occasional, so accidental, so full of the echoes of voices that are not the voice of the muse. Gustave Flaubert, Émile Zola, Alphonse Daudet, on the other hand, are nothing if not concentrated and sedentary. Trollope's realism is as instinctive, as inveterate as theirs; but nothing could mark more the difference between the French and English mind than the difference in the application, on one side and the other, of this system. We say system, though on Trollope's part it is none. He has no visible, certainly no explicit care for the literary part of the business; he writes easily, comfortably, and profusely, but his style has nothing in common either with the vivid brush-work of Daudet or the calculated harmonies of Flaubert. He accepted all the common restrictions, and found that even within the barriers there was plenty of material. He attaches a preface to one of his novels — "The Vicar of Bullhampton," before mentioned — for the express purpose of explaining why he has introduced a young woman who may, in truth, as he says, be called a "castaway"; and in relation to this episode he remarks that it is the object of the novelist's art to entertain the young people of both sexes. Writers of the French school would, of course, protest indignantly against such a formula as this, which is the only one of the kind that I remember to have encountered in Trollope's pages. It is narrow, assuredly; but Trollope's practice was really much larger than such a theory. And indeed any theory was good which enabled him to produce the works which he put forth between 1856 and 1869, or later. In spite of his want of doctrinal richness, I think he tells us, on the whole, more about life than the "naturalists" in our sister republic. I say this with the full consciousness of the opportunities an artist loses in leaving so many corners unvisited, so many topics untouched, simply because I think his perception of character was more naturally just and temperate than that of the naturalists. This has been from the beginning the good fortune of our English providers of fiction, as compared with the French. They are inferior in audacity, in neatness, in acuteness, in intellectual vivacity, in the arrangement of material, in the art of characterizing visible things. But they have been more at home in the moral world; they have put their finger on the right chord of the conscience. This is the value of much of the work done by the feminine wing of the

school — work which presents itself to French taste as terribly gray and insipid. Much of it is exquisitely human, and that, after all, is a merit. As regards Trollope, one may perhaps characterize him best, in opposition to what I have ventured to call the sedentary school, by saying that he was a novelist who hunted the fox. Hunting was for years his most valued recreation, and I remember that, when I made in his company the voyage of which I have spoken, he had timed his return from the antipodes exactly to be able to avail himself of the first day on which it should be possible to ride to hounds. He "worked" the hunting-field largely. It constantly re-appears in his novels. It was excellent material.

But it would be hard to say (within the circle in which he revolved) what material he neglected. I have allowed myself to be detained so long by general considerations, that I have almost forfeited the opportunity to give examples. I have spoken of "The Warden," not only because it made his reputation, but because, taken in conjunction with "Barchester Towers," it is thought by many people to be his most vigorous story. "Barchester Towers" is admirable; it has an almost Thackerayan richness. Archdeacon Grantley is still more powerfully developed, and Mr. Harding is as charming as ever. Mrs. Proudie is ushered into a world in which she was to make so great an impression. Mrs. Proudie has become classical; of all Trollope's characters, she is the most often referred to. She is exceedingly good; but I do not think she is quite so good as her fame and as several figures from the same hand that have not won as much honor. She is rather too violent, too vixenish, too sour. The truly awful female bully — the completely fatal episcopal spouse — would have, I think, a more insidious form, a greater amount of superficial padding. The Stanhope family, in "Barchester Towers," are a real *trouvaille*, and the idea of transporting the Signora Vesey-Neroni into a cathedral-town was an inspiration. There could not be a better example of Trollope's manner of attaching himself to character than the whole picture of Bertie Stanhope. Bertie is a delightful creation; and the scene in which, at the party given by Mrs. Proudie, he puts this majestic woman to rout is one of the most amusing in all the chronicles of Barset. It is perhaps permitted to wish, by the way, that this triumph had been effected by intellectual means rather than by physical; though, indeed, if Bertie had not despoiled her of her drapery we should have lost the lady's admirable "Unhand it, sir!" Mr. Arabin is charming, and the henpecked bishop has painful truth; but Mr. Slope, I think, is a little too arrant a scamp. He is rather too much what the French call *ancien jeu;* he goes too coarsely to work, and his clamminess and cant are somewhat overdone. He is an interesting illustration, however, of the author's dislike (at that period, at least) of the bareness of evangelical piety. In one respect "Barchester Towers" is (to the best of our recollection) unique, being the only one of Trollope's novels in which the interest does not center more or less upon a simple maiden in her flower. The novel does not contain the least young girl; though we know that this attractive object was to lose nothing by waiting. Eleanor Bold is a charming and natural person; but Eleanor Bold is not in her flower. After this, however, Trollope settled down steadily to the English girl; he took possession of her; he turned her inside out. He never made her a subject of heartless satire, as cynical fabulists of other lands have been known to make the sparkling daughters of those climes; he bestowed upon her the most serious, the most patient, the most tender, the most copious consideration. He is evidently always more or less in love with her, and it is a wonder how under these circumstances he should make her so objective, plant her so well on her feet. But, as I have said, if he was a lover, he was a paternal lover; as competent as a father who has had fifty daughters. He has presented the British maiden under innumerable names, in every station and in every emergency in life, and with every combination of moral and physical qualities. She is always definite and natural. She plays her part most properly. She has always health in her cheek and gratitude in her eye. She has not a touch of the morbid, and is delightfully tender, modest and fresh. Trollope's heroines have a strong family likeness, but it is a wonder how finely he discriminates between them. One feels, as one reads him, like a man with "sets" of female cousins. Such a person is inclined at first to lump each group together; but presently he finds that even in the groups there are subtle differences. Trollope's girls, for that matter, would make delightful cousins. He has scarcely drawn, that we can remember, a disagreeable damsel. Lady Alexandrina de Courcy is disagreeable, and so is Amelia Roper, and so are various provincial (and, indeed, metropolitan) spinsters, who set their caps at young clergymen and Government-clerks. Griselda Grantley was a stick; and considering that she was intended to be attractive, Alice Vavasor does not commend herself particularly to our affections. But the young women I have mentioned had ceased to belong to the tender category; they had

entered the period of toughness or flatness. Not that Trollope's more mature spinsters invariably fall into these extremes. Miss Thorne of Ullathorne, Miss Dunstable, Miss Mackenzie, Rachel Ray (if she may be called mature), Miss Baker and Miss Todd, in "The Bertrams," Lady Julia Guest, who comforts poor John Eames: these and many other amiable figures rise up to contradict the idea. A gentleman who had sojourned in many lands was once asked by a lady (neither of these persons was English) in what country he had found the women most to his taste. "Well, in England," he replied. "In England?" the lady repeated. "Oh, yes," said her interlocutor; "they are so affectionate!" The remark was fatuous; but it has the merit of describing Trollope's heroines. They are so affectionate. Mary Thorne, Lucy Robarts, Adela Gauntlet, Lily Dale, Nora Rowley, Grace Crawley, have a kind of clinging tenderness, a passive sweetness, which is quite in the old English tradition. Trollope's genius is not the genius of Shakspere, but his heroines have something of the fragrance of Imogen and Desdemona. There are two little stories, to which, I believe, his name has never been affixed, but which he is known to have written, that contain an extraordinarily touching representation of the passion of love in its most modest form. In "Linda Tressel" and "Nina Balatka" the vehicle is plodding prose, but the effect is none the less poignant. And in regard to this I may say that in a hundred places in Trollope the extremity of pathos is reached by the homeliest means. He often achieved a very eminent degree of the tragical. The long, slow process of the conjugal wreck of Louis Trevelyan and his wife (in "He Knew He Was Right"), with that rather ponderous movement which is often characteristic of Trollope, arrives at last at an impressive completeness of misery. It is the history of an accidental rupture between two stiff-necked and ungracious people,—"the little rift within the lute,"—which widens at last into a gulf of anguish. Touch is added to touch; one small, stupid, fatal aggravation to another; and as we gaze into the widening breach we wonder at the materials of which tragedy sometimes composes itself. I have always remembered the chapter called "Casalunga," toward the close of "He Knew He Was Right," as a very powerful picture of the insanity of stiff-neckedness. Louis Trevelyan, separated from his wife, alone, haggard, suspicious, unshaven, undressed, living in a desolate villa on a hill-top near Siena, and returning doggedly to his fancied wrong, which he has nursed until it becomes an hallucination, is a picture worthy of Balzac. Here and in several other places Trollope has dared to be thoroughly logical; he has not sacrificed to conventional optimism; he has not been afraid of a misery which should be too much like life. He has had the same courage in the history of the wretched Mr. Crawley, and in that of the much to be pitied Lady Mason. In this latter episode, he found an admirable subject. A quiet, charming, tender-souled English gentlewoman, who (as I remember the story of "Orley Farm") forges a codicil to a will in order to benefit her son, a young prig who doesn't appreciate immoral heroism, and who is suspected, accused, tried, and saved from conviction only by some turn of fortune that I forget; who is, furthermore, an object of high-bred, respectful, old-fashioned gallantry on the part of a neighboring baronet, so that she sees herself dishonored in his eyes as well as condemned in those of her boy: such a personage and such a situation would be sure to yield, under Trollope's handling, the last drop of their reality.

There are many more things to say about him than I am able to add to these very general observations, the limit of which I have already passed. It would be natural, for instance, for a critic who affirms that his principal merit is the portrayal of individual character, to enumerate several of the figures that he has produced. I have not done this, and I must ask the reader who is not acquainted with Trollope to take my assertion on trust; the reader who knows him will easily make a list for himself. No account of him is complete in which allusion is not made to his practice of carrying certain persons from one story to another—a practice which he may be said to have inherited from Thackeray, as Thackeray may be said to have borrowed it from Balzac. It is a great mistake, however, to speak of it as an artifice which would not naturally occur to a writer proposing to himself to make a general portrait of a society. He has to construct that society, and it adds to the illusion in any given case that certain other cases correspond with it. Trollope constructed a great many things—a clergy, an aristocracy, a *bourgeoisie*, an administrative class, a specimen of the political world. His political novels are distinctly dull, and I confess I have not been able to read them. He evidently took a good deal of pains with his aristocracy; it makes its first appearance, if I remember right, in "Doctor Thorne," in the person of the Lady Arabella de Courcy. It is difficult for us in America to measure the success of that picture, which is probably, however, not absolutely to the life. There is in "Doctor Thorne," and some other works,

too constant a reference to the distinction of classes—as if people's consciousness of this matter were not (as one may say) chronic, but permanently acute. It is true that, if Trollope's consciousness had not been acute, he would, perhaps, not have given us Lady Lufton and Lady Glencora Palliser. Both of these noble persons are as living as possible, though I see Lady Lufton, with her terror of Lucy Robarts, the best. There is a touch of poetry in the figure of Lady Glencora; but I think there is a weak spot in her history. The actual woman would have made a fool of herself to the end with Burgo Fitzgerald; she would not have discovered the merits of Plantagenet Palliser—or if she had, she would not have cared about them. It is an illustration of the business-like way in which Trollope laid out his work, that he always provided a sort of underplot to alternate with his main story—a strain of narrative of which the scene is usually laid in a humbler walk of life. It is to his underplot that he generally relegates his vulgar people, his disagreeable young women; and I have often admired the pertinacity with which he unfolds this more depressing branch of the tale. Now and then, it may be said, as in "Ralph the Heir," the story appears to be all underplot and all vulgar people. These, however, are details. As I have already intimated, it is difficult to specify in Trollope's work, on account of the immense quantity of it; and there is sadness in the thought that this enormous mass does not present itself in a very portable form to posterity.

Trollope did not write for posterity; he wrote for the day, the moment; but these are just the writers of whom posterity is apt to take hold. So much of the life of his time is reflected in his novels, that we must believe a part of the record will be saved; and they are full of so much that is sound and true and genial, that readers with an eye to that sort of entertainment will always be sure, in a certain proportion, to turn to them. Trollope will remain one of the most trustworthy, though not one of the most eloquent, of the writers who have helped the heart of man to know itself. The heart of man does not always desire this knowledge; it prefers sometimes to look at history in another way—to look at the manifestations, without troubling about the motives. There are two kinds of taste in the appreciation of imaginative literature: the taste for emotions of surprise, and the taste for emotions of familiarity. It is the latter that Trollope gratifies, and he gratifies it the more that the medium of his own mind, through which we see what he shows us, gives confidence to our sympathy. His natural rightness and purity are so real that the good things he projects must be real. A race is fortunate when it has a good deal of the sort of imagination—of imaginative feeling—that had fallen to the share of Anthony Trollope. Our English race, happily, has much of it.

Henry James.

THE PHILADELPHIA COMMITTEE OF ONE HUNDRED.

A FEW years ago, Philadelphia was the worst governed city in the United States. This statement will call to the reader's mind the condition of New York under the Tweed Ring; but maladministration was at no time so completely and intelligently systematized by Tweed and his associates as it was in Philadelphia by the little group of men who, for ten years, managed the affairs of the Quaker City; nor was it difficult to overthrow. New York, as a rule, is a Republican State, and the Tweed Ring was Democratic; consequently, when a Republican legislature was sitting, the suffering citizens were able to get some relief from the State capital, in the way of amendments to the city charter which took some of the city departments out of the hands of the plunderers. The Philadelphia Ring shrewdly attached itself to the party in power in the State, and, by furnishing fraudulent majorities in the city to sustain that party in close contests, made itself necessary to the politicians managing the party machine in the State, and by the aid of the large delegation sent to Harrisburg from the city districts obtained a shield and ally in the legislative power. Besides, the members of the Philadelphia Ring were shrewder, more cautious, more dexterous, less openly indecorous, and, to put it bluntly, less hoggish than the rascals who robbed New York. They subsidized the press whenever they could, instead of defying it; they put able and outwardly respectable men in the higher offices instead of coarse ruffians; they behaved quietly in their private lives instead of flaunting their wealth and vices in the face of the public; they held closely together and never let the people know of their quarrels over the spoils. The Philadelphia Ring, like the old New York

Ring, had a large foreign and ignorant native element in the city's population to manipulate at elections; but the former had the disadvantage, in comparison with the New York Ring, of having to deal with upper and middle classes which could more easily be rallied to oppose them, and were often strongly moved by civil pride and local patriotism. A Philadelphian is proud of his city; a New Yorker rarely shows any of the old burgher spirit. To prevent, for ten years, the intelligent, tax-paying classes in Philadelphia from combining to expose and crush the Ring required no small amount of tact and cunning.

When the Philadelphia Ring was at the height of its power, it controlled all branches of the city government, and by its partnership with a State Ring, whose field of operations was the Legislature and the State offices, it was able to make or unmake laws as suited its end. The streets of the city were paved with cobble-stones and were in a shocking condition, dirty and full of ruts and holes, in spite of the large sums nominally spent upon them each year. The tramway companies, though required by their charters to keep the roadways occupied by their tracks well paved from curb to curb, paid no attention to the law, finding it cheaper to cultivate the friendship of the officials whose duty it was to call them to account. The police force was made up of unscrupulous ward politicians, whose first duty was understood by them to be to pack caucuses and conventions and carry elections as the Ring ordered. The officers of the gas-works,—public property in Philadelphia, and called by law the Gas Trust,—charged exorbitant prices for gas, and made enormous profits, which were diverted from the public treasury, and found their way by concealed channels into private pockets. The Delinquent Tax office, by authority of an outrageous statute, extorted a princely revenue from the poor for the benefit of the Ring. The sheriff's fees were double the salary of the President of the United States, and the subordinates in the sheriff's office grew rich on the proceeds of "fixing juries." Political influence filled the public schools with inefficient teachers. The governing bodies of the municipality, the Select and Common councils, were the chief seats of jobbery and corruption. Even the prisons paid tribute to the Ring; and the almshouse was a sink of iniquity, where pauperism was plundered in its last resort. The mayor was a servant of the Ring and a member of a select organization of its members and chief dependents, known as the Pilgrims' Club. The city's representatives in the State Legislature were, with few exceptions, disreputable strikers and tricksters from the lowest sediment of ward politics, and were commonly known at Harrisburg as "roosters," a term of their own adoption. Corruption entered the courts. Elections were a mockery, and voting a useless trouble, since the Ring regularly manufactured whatever majorities it needed by a system of false counting.

A great change has recently been brought about in this wretched condition of affairs by the sincere, courageous, and persistent efforts of a few business men acting in the field of politics but outside of party lines. These men successfully appealed to the conscience, self-interest, and public spirit of the best classes of their fellow-citizens. They converted opposition to the Ring from a sentiment into an organized effort. They began and carried forward a work of municipal reform, so honest, so thorough, and so efficient, that it deserves to be studied and imitated wherever gross abuses exist in city governments.

The Philadelphia Ring was organized during the war of the rebellion. People's minds were too much occupied with the tremendous struggle for the life and unity of the nation to concern themselves much with their municipal affairs. The nation's extremity was the rogues' opportunity. Besides, the Ring attached itself to the patriotic party carrying on the war. Philadelphia, unlike New York, was an intensely loyal city. Its manufactories were busily employed making goods for the army and navy. In no other city were there so many people working for the Government. The power of the political machine was necessary, in order to carry the city for the Republican party and to carry the State for, without a considerable majority in Philadelphia, Pennsylvania was in danger of going over to the Democrats. Under these circumstances, good citizens were disposed to shut their eyes to what was going on in the municipality. When the fate of the Republic was hanging in the balance and depending on the turn in a battle at the South, or the result of an election in the North, how could they bother about paving contracts or the management of the gas-works or the building of a reservoir? So the Ring grew and prospered, and for more than a decade held the city in absolute control. During those years, it levied a tax of from thirty-five to forty-five cents, on the hundred dollars, heavier than the present rate; it added an average of $3,000,000 a year to the city's debt; and it made not a single important public improvement. The work of reform has reduced taxation over forty-five cents on each $100 of valuation, stopped the contraction of debts, made some needed improvements, and shows at the year's end a surplus of about

a million. Contrasting the expenditures under the present reform administration of the city's affairs with those of the Ring administration, it is a reasonable estimate to say that the plunder and waste of the Ring aggregated the enormous sum of five millions of dollars a year. Most of this sum was diffused among hundreds of little sub-bosses, whose support had to be bought by the chiefs of the Ring. In its inner circle, the Ring was composed of six men, who parceled out the principal municipal offices among themselves, or put obedient tools in them to pay over the profits. These six men made up the Republican ticket for city offices as regularly as an election came around. One would say, "I want the sheriff's office this time"; another, "It's my turn to have a whack at the city treasury." Sometimes they would quarrel among themselves over the spoils. Then the nominating convention would be put off for a week or two; but in the end they always agreed, because they could not afford to come to an open rupture. They controlled the primaries and nominating conventions through the police force, made up of men who were actively and shamelessly their servants, and through the contractors and their employés. Under the contract system the Ring had many thousand men in its pay, all expert politicians, so distributed over the city as to operate at canvasses and elections in every ward and voting precinct.

There never was so perfect a political machine. The police and the contractors and their men prevented the nomination of any man for office who was likely to be hostile to the Ring. When a ward was Democratic, the Ring dealt with the local Democratic politicians and purchased their support with place and patronage. The corrupt men of both parties served it with equal zeal. Nobody could be elected to any office in Philadelphia who was not pledged either to active support or passive tolerance of the Ring. Even the men who represented the city in the Congress of the United States declined to take active part against it.

The Ring early took measures to subsidize the public press, and thus to prevent an exposure of its evil practices. Laws were enacted by the Legislature which enabled the city government to spend, through its various departments, an aggregate of a quarter of a million a year in advertising. A considerable portion of this sum was pocketed by the officials themselves in the form of drawbacks from the subsidized newspapers; the remainder enabled them to buy the silence of some papers and the pen-advocacy of others. To one they gave $50,000; to another, $25,000; to another, $10,000. Even the weeklies and the Sunday papers had a share. With several of these sheets the withdrawal of the city advertising meant immediate bankruptcy, and with more than one of the more respectable the difference between enjoying the favor of the Ring and having its enmity was the difference between a comfortable surplus and straitened circumstances. The club dinners, the drives in Fairmount Park, and the summers at Cape May of more than one Philadelphia editor were dependent on his services to the Ring.

Another law, passed early in the history of the Philadelphia Ring, gave it such control over the election machinery that it could count in or count out any ticket or any single candidate. This was the so-called Registry law, passed after the Ring had received a check through the election of a Democratic mayor and district attorney in 1868. The registry lists under this law were made up by the servants of the Ring, who put on or left off such names as they wished. From voting on fictitious names by gangs of repeaters, who went from poll to poll, the fraudulent election system finally progressed to the direct falsification of counts and returns, which was found to be the least expensive and most certain method of defeating the popular will. The inspectors of elections were the creatures of the Ring. Often their return of ballots cast bore no sort of relation to the votes taken from the boxes. When the fraudulent returns from the precincts did not produce the general result desired, there was a canvassing board, sitting with closed doors in the City Hall, which changed the totals. At one election for Governor, the members of this board and other attachés of the Ring made large bets in New York (nobody in Philadelphia was so ignorant of Ring methods as to bet against them) that the Republican candidate would have 20,000 majority in the city. When the returns came in, fraudulent in large part as they were, the majority only footed up a little over 16,000. Thereupon one of the board, commonly known as the "lightning calculator" from his expertness in this sort of rascality, deliberately changed 2000 to the wrong column. The bets were won, and the figures, as thus amended by the lightning process, went into the official returns of the State.

It would be a long story to tell of the struggle against the Philadelphia Ring, and perhaps if told here it would have only a local interest. It assumed many phases; now under the leadership of the Reform Club, an organization semi-social and semi-political; now under that of the Municipal Reform Association; abandoned at times in despair, and then renewed with fresh hope; associating it-

self with regular party politics at times, and then holding aloof; winning some notable successes, only to see their fruits slip away for lack of continuity of effort to retain them. At last, however, after ten years of gallant, spasmodic effort, an organization was evolved from the crying needs of the situation that not only did effective work but held on to all it gained in the direction of good government and made its successes levers to open the way to further achievements. This was the Citizens' Committee of One Hundred, formed in 1880. The Committee was chiefly composed of business men, whose names were known to the whole city for their honorable connection with leading mercantile houses. Not a single member was a politician or an aspirant for office. Indeed, the articles of association of the body provide that no person holding any important office under the national, State, or city government shall be eligible for membership; and that any member becoming a candidate for office shall cease to take an active part in the affairs of the Committee, and if elected shall cease to be a member. The purposes of the Committee were concisely set forth at the outset to be: To maintain the purity of the ballot; to secure the nomination and election of a better class of candidates for office; to prosecute and bring to punishment those who had been guilty of election frauds, maladministration of office, or misappropriation of public funds; to prevent objectionable legislation, and aid in procuring such as the public welfare demands; to advocate and promote a public service based upon character and capability only.

In the short space of three years, the Committee of One Hundred has destroyed the power of the Ring, wresting one department of the municipal government after another from its grasp until now but few officials remain in place who are not faithful servants of the interests of the honest tax-paying citizens. Another year will probably complete the good work.

By the time the Committee had won two or three notable successes, the old politicians of both parties realized that here was a new power in municipal affairs which sneers and ridicule and personal abuse did not affect, and which went straight on to its ends without regard to party cries and shrieks about the country's being in danger. The leading idea of the Committee from the first was that national politics had no proper place in a city election; that a man's opinions on the protective tariff, or the national banking law, or the Bourbon régime in the South, were no test of his fitness to collect taxes or manage the gas-works honestly. The politicians found that, in this notion that faithful and competent men were wanted to manage municipal affairs, without regard to their affiliations with national parties, the Committee had the support of a large majority of the voters of Philadelphia. Great was the consternation when this conviction was borne in upon the minds of the members and hangers-on of the old Ring. What should they do? Should they seek safety in election frauds? Unfortunately for this resource, the Committee followed up so sharply men found guilty of such frauds, and sent so many of them to jail, that the system once so successful could not again be put in operation on a large scale. Since February, 1881, the Committee have secured the conviction of twenty-seven men for violating the election laws.

I have space here only to speak briefly of the methods employed by the Committee of One Hundred to carry on its work. These methods may perhaps be fairly summarized as follows:

First. Every voter is appealed to personally by circulars sent to him at his residence. These circulars are models of brevity, directness, and force. They tell in the plainest language the reasons for opposing this candidate and supporting that. In pointing out corruption and maladministration, they call a spade a spade. Before an election every voter receives at his house the ticket recommended by the Committee.

Second. The Committee never rests its case on rumors or general belief. Specific charges are made against each city department whose management it assails. Facts, and not mere arguments, are presented to the voters. For example, when the Highway department was attacked, the Committee had the work on the streets examined and measured, and compared their own figures with the contracts and bills of the contractors.

Third. The Committee does not meddle with State or national politics. The tickets it sent out last fall were of three kinds: One headed by the Republican, one by the Democratic, and one by the Independent State nominations,—the city nominations of the Committee appearing on all. Thus the voter could take his choice of State tickets, and he saw that the Committee's only object was to secure his aid in reforming abuses in the municipality.

Fourth. A definite, well considered plan for re-organizing the city government, reducing the number of departments, concentrating responsibility, cutting down extravagant salaries, and turning into the treasury the excessive fees which furnish political corruption funds, is adopted in the form of a bill to go before the Legislature, and every candidate for the Legislature obtaining the Committee's indorsement pledges his support to the measure.

Fifth. Efficient local work in the wards and election districts is secured by a system of ward associations acting in concert with the Committee of One Hundred.

Sixth. There is a special committee of the Committee of One Hundred on election frauds, which offers rewards for information leading to the arrest and conviction of persons guilty of violating the election laws. The work of the committee has terrorized the whole gang of ballot-box stuffers, personators, repeaters, and false counters, and by vigilant watching of the polls has made honest elections possible.

Seventh. The cost of bad government to the individual citizen is plainly shown in dollars and cents. If he be a taxpayer, the amount added to his taxes is figured up; if he rents a house or only a few rooms, he is informed that he pays a certain amount monthly in the way of increased rental because of the corrupt and wasteful management of municipal affairs.

THE Committee of One Hundred has of late been sustained by a number of the leading newspapers of Philadelphia. When the Reform work was first begun in that city only one daily journal sustained it. With the awakening and organization of public opinion has come about a better state of affairs in the press, and in the last contest at the polls most of the influential dailies were on the side of the Committee. In converting the people to faith in the need and feasibility of reform the Committee have converted the press, so that reputable papers are no longer silenced by advertising bribes.

The history of the Committee of One Hundred in Philadelphia shows that the evils of extravagance and corruption in municipal administration, so common in American cities, are not the necessary concomitants of universal suffrage in communities made up in considerable part of the ignorant and the irresponsible; that such evils grow out of the inactivity, indifference, and easy-going tolerance of the intelligent, property-owning classes; that by proper effort a majority can always be obtained for honest men and good government, even under the most discouraging conditions; and that the strongest, best organized, and most firmly seated ring of politicians that ever systemized plunder and misrule can be broken and destroyed by the persevering attacks of plain business men without experience in the arts of politics.

E. V. Smalley.

RECOLLECTIONS OF THE JOHN BROWN RAID.

BY A VIRGINIAN WHO WITNESSED THE FIGHT.

STORER COLLEGE, at Harper's Ferry, West Virginia, a flourishing institution "for the education of colored youth of both sexes," owes its existence to the philanthropic gentleman of New Engand whose name it has taken. At its fourteenth annual commencement on May 30, 1881, Frederick Douglass, who is undoubtedly the most gifted orator of his race, delivered a eulogistic address on old John Brown, in which he claimed for him "the honor" of having originated the war between the Northern and Southern sections of our Union,—summing up his conclusions on this point in the following expressive language: "If," said he, "John Brown did not end the war that ended slavery, he did, at least, begin the war that ended slavery. If we look over the dates, places, and men for which this honor is claimed, we shall find that not Carolina, but Virginia,—not Fort Sumter, but Harper's Ferry and the arsenal,—not Major Anderson, but John Brown began the war that ended American slavery, and made this a free republic. Until this blow was struck, the prospect for freedom was dim, shadowy, and uncertain. The irrepressible conflict was one of words, votes, and compromises. When John Brown stretched forth his arm the sky was cleared,—the time for compromises was gone,—the armed hosts of freedom stood face to face over the chasm of a broken Union, and the clash of arms was at hand."

These words, uttered with an emphasis belonging to a strong conviction of their truth, will be accepted by the public as an authentic but somewhat tardy confession of one who, as a confidential coadjutor of Brown in his conspiracy against the South, is understood to have been fully acquainted with his plans and purposes; and the avowal thus frankly made by him is sufficiently confirmed by the contemporaneous facts to which it refers. For, when a complete and impartial history of our late civil war shall be written, it will be seen that the "John Brown Raid," at Harper's Ferry, in the latter part of 1859, was indeed the beginning of actual hostilities in the Southern States; that then and

there the first shot was fired and the first blood was shed—the blood of an unoffending free negro, foully murdered while in the faithful discharge of his duty! It will be further seen that there and then occurred the first forcible seizure of public property; the first attempt to "hold, occupy, and possess" a military post of the Government; the first outrage perpetrated on the old flag; the first armed resistance to national troops; the first organized effort to establish a Provisional Government at the South, in opposition to that of the United States; the first overt movements to subvert the authority of the constitution and to destroy the integrity of the Union.

Looked at in the light of subsequent events these facts, with their antecedent and attendant circumstances, are so significant that few now can fail to see and none need hesitate to say that "the abolition affair at Harper's Ferry," in the fall of '59, was an appropriate prelude to that gigantic war which was so soon to follow it, and which, conducted on a scale commensurate with the magnitude of the work to be accomplished, effectually completed what old John Brown so fatally began—a work concerning which the friends of Brown now boast that "Lincoln with his proclamations, Grant and Sherman with their armies, and Sumner with his constitutional amendments, did little more than follow in the path which Brown had pointed out." [F. B. Sanborn, in "Atlantic Monthly," April, 1875.] But whatever difference of opinion yet exists as to who fired the first hostile gun in the South,—John Brown or General Beauregard,—one thing is certain: If it had not been for a comparatively small class of factious and implacable politicians in both sections,—the active abolitionists of the North and the secessionists *per se* of the South,—there would have been no fratricidal civil war, especially if it had depended on the aforesaid extremists to go to the front and do the fighting. But it is enough for us to know what was actually done during a maddened and misguided epoch and what our obvious duty is in these improving times of reëstablished peace, and, it is to be hoped, restored fraternity.

Passing by the question, then, as to whether the Harper's Ferry outbreak was "a legitimate consequence of the teachings of the Republican party," as was claimed at the time of its occurrence by some of the prominent leaders of that party; disregarding also the kindred inquiry as to whether the forcible extinction of slavery in the South was the logical consummation of a foregone conclusion in the North, where it had long been labored for by a constantly increasing faction, who, professing to be governed in their political action by a "higher law" than the constitution, were willing to "let the Union slide" for the sake of abolition, and who, likewise, on that account, opposing all compromises, persistently urged war at a time when many patriots, North and South, were nobly striving to avert that calamity,—I will confine myself here to outlining some of the scenes and incidents that occurred, partly under my personal observation, at the time of Brown's hostile incursion, for which he and his deluded followers paid the forfeit of their lives, and from which the people of the unfortunate town selected for his midnight raid may date the beginning of the end of their former prosperity.

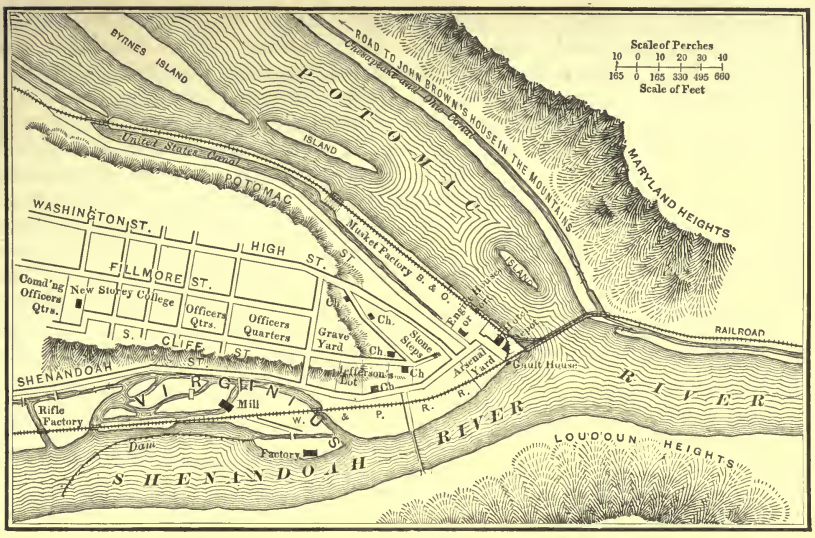
On the morning of the raid, Monday, Oct. 17, 1859, I was at my home near Shepherdstown (ten miles west of Harper's Ferry), and had hardly finished breakfast when a carriage came to the door with one of my daughters, who told me that a messenger had arrived at Shepherdstown, a few minutes before, with the startling intelligence of a negro insurrection at Harper's Ferry!

She could give no particulars, except that a number of armed abolitionists from the North—supposed to be some hundreds—had stolen into "the Ferry" during the previous night, and, having taken possession of the national armories and arsenal, were issuing guns to the negroes and shooting down unarmed citizens in the streets. Ordering my horse, I started at once for Harper's Ferry, by way of Shepherdstown, where I found the people very much excited. Their first feeling, on hearing the news, had naturally been one of amazed and, with some, of amused incredulity, which, however, soon gave place to an intense and pardonable indignation.

The only military organization of the precinct—a rifle company, called "The Hamtramck Guards"—had been ordered out, and as I rode through town the command was nearly ready to take up its line of march for the Ferry, while a goodly number of volunteers, with every sort of fire-arm, from old Tower muskets which had done service in colonial days to modern bird-guns, were joining them. I observed, in passing the farms along my route, that the negroes were at work as usual. When near Bolivar,—a suburb of Harper's Ferry,—I saw a little old "darky" coming across a field toward me as fast as a pair of bandy legs, aided by a crooked stick, could carry him. From the frequent glances he cast over his shoulder and his urgent pace, it was evident that the old fellow was fleeing from some apprehended danger, and was fearfully demoralized.

I hailed him with the inquiry:

"Well, uncle, which way?"



HARPER'S FERRY.

"Sarvint, marster! I'se only gwine a piece in de country for ter git away from de Ferry."

"You seem to be in a hurry," said I.

"Yes, sah, I is dat, an' it's 'bout time ter be in a hurry when dey gits ter shootin' sho 'nuff bullets at yer."

"Why, has any one been shooting at you?"

"No, not exactly at me, bless de Lord! kase I didn't give 'em a chance ter. But dey's been a-shootin' at pleanty folks down dar in de Ferry, an' a-killen of 'em, too."

"Who's doing the killing?"

"De Lord above knows, marster! But I hearn tell dis mornin' dat some of de white folks allowed dey was abolitioners, come down for ter raise a ruction 'mong de colored people."

And on inquiring if any of the colored people had joined them, "No-sah-ree!" was his prompt and emphatic answer, at the same time striking the ground with his stick, as if to give additional force to the denial.

I insert this colloquy simply because it tends to illustrate the fears and feelings of the negroes at Harper's Ferry as well as in the surrounding region, at the time of Brown's abortive attempt to secure their aid. Somewhat relieved by the assurance that the negroes had nothing to do with the trouble, I continued on my way to Harper's Ferry, arriving a little before noon.

It is necessary here to give a summary of the day's doings up to the time of my arrival at the Ferry, together with a preliminary explanation of Brown's plans and preparations. From facts which are fully admitted by his friends, it is now known that for more than five and twenty years Brown had cherished the idea of making slavery "insecure" in the States where it existed by a preconcerted series of hostile raids and servile insurrections, and that at least two years previous to his raid on Harper's Ferry he had selected it as a suitable place for the initial attack. His three principal reasons for choosing the Ferry as his *point d'appui* were: (1) The presence of a large slave population in what is known as "the Lower Valley," which is that fair and fertile portion of the great valley of Virginia embraced within the angle formed by the Potomac and Shenandoah rivers before their confluence at Harper's Ferry; (2) the proximity of the Blue Ridge range of mountains, where, in their rocky recesses and along their densely wooded slopes, he would be comparatively safe from pursuit and better able to protect himself from attack; (3) because of the location at Harper's Ferry of the United States armories and arsenal, in which were always stored many thousand stands of arms without sufficient guard to protect them.

His plan was to make the Blue Ridge Mountains his base of operations and, descending from them at night with his armed marauders, to attack the unprotected villages and isolated farm-houses within his reach, wherever and whenever his incursions would probably be least expected.

These raids were to be made on the Piedmont side of the Blue Ridge, as well as in the Valley,—"his forces acting as infantry or cavalry," according to circumstances, and to have no scruples against taking the horses of the slave-holders and other needed property.

As many of the slaves as could be induced to abandon their homes were to be armed and drilled, and, by recruiting his "army of occupation" in this way, he expected soon

to raise a large body of blacks, reënforced by such white men as he could enlist, with which he believed he could maintain himself successfully in the mountains, and, by a predatory war, so harass and paralyze the people along the Blue Ridge, through Virginia and Tennessee into Alabama, that the whole South would become alarmed and slavery be made so insecure that the slave-holders themselves, for their own safety and that of their families, would be compelled to emancipate their negroes. It was, also, a part of his plan to seize the prominent slave-owners and hold them prisoners either "for the purposes of retaliation," or as hostages for the safety of himself and his band, to be ransomed only upon the surrender of a specified number of their slaves, who were to be given their freedom in exchange for that of their masters.

When Brown went to Europe in 1848, to sell Ohio wool, it is said that he inspected fortifications on the Continent, "with a view of applying the knowledge thus gained, with modifications of his own, to mountain warfare in the United States"; and though not much given to books, he read all he could get that treated of insurrectionary warfare. Plutarch's account of the stand made for years by Sertorius, the Spanish chieftain, against the combined power of the Romans, it is said, was frequently referred to by him in conversation with his friends, as also the war against the Russians by Schamyl, the Circassian chief; that against the United States by Osceola, in the Everglades of Florida; and that so successfully fought by Toussaint L'Ouverture and Dessalines, in St. Domingo. He likewise regarded his own bloody experiences in Kansas as so many practical lessons on the skirmish line; and he also believed himself to be an appointed agent of Deity in the work he intended to do.

He allowed few of his friends besides his immediate followers to know his plans; but there were certain pseudo-philanthropists in the North who knew all about them, and who now boast that, with a full knowledge of his intentions, they "were indifferent to the reproach of having aided him" with means for their execution. While the self-sacrificing bravery of Brown has a claim to our respect and admiration, however much we may condemn his unlawful and treacherous attack, Southern people can feel only abhorrence and contempt for the cowardly conspirators who encouraged his design without having the manliness to share its dangers.

John Brown's first appearance south of Mason and Dixon's line was on June 30th, 1859, at Hagerstown, in Maryland. Coming from Chambersburg, in company with a man named Anderson, who was one of his "lieutenants," they remained over night there, "passing themselves off for Yankees going through the mountains in search of minerals." On July 3, he appeared at Harper's Ferry, under the assumed name of Smith, with his two sons—Watson and Oliver—and "Lieutenant "Anderson, passing that night at a small tavern in Sandy Hook, a hamlet on the left, or Maryland, bank of the Potomac, about a mile below the Ferry. The next day, July 4, a farmer, whom I knew very well, met them on a mountain road above the Ferry, when, in reply to his remark: "Well, gentlemen, I suppose you are out hunting minerals?" Brown said, "No, we are not; we are looking for land." He said they were "farmers from the western part of New York," whose crops had been so "cut off" by the frosts, that they had concluded to settle farther south.

Subsequent conversations directed Brown's attention to a small tract further up the road, about five miles from the Ferry, belonging to the heirs of Dr. Booth Kennedy, and a few weeks later he rented a portion of it, including "the improvements," which consisted of a plain two-storied log-house with a high basement, and a small outhouse or shop, which was also of logs; for which, with the right to fire-wood and pasture for a horse and cow, he paid, in advance, thirty-five dollars, taking the property until the first of March following. The place was admirably adapted to the purposes of concealment, being somewhat remote from other settlements, surrounded by dense forests, with its houses some distance back from the rarely traveled public road in front of them, and almost entirely hidden from view by undergrowth.

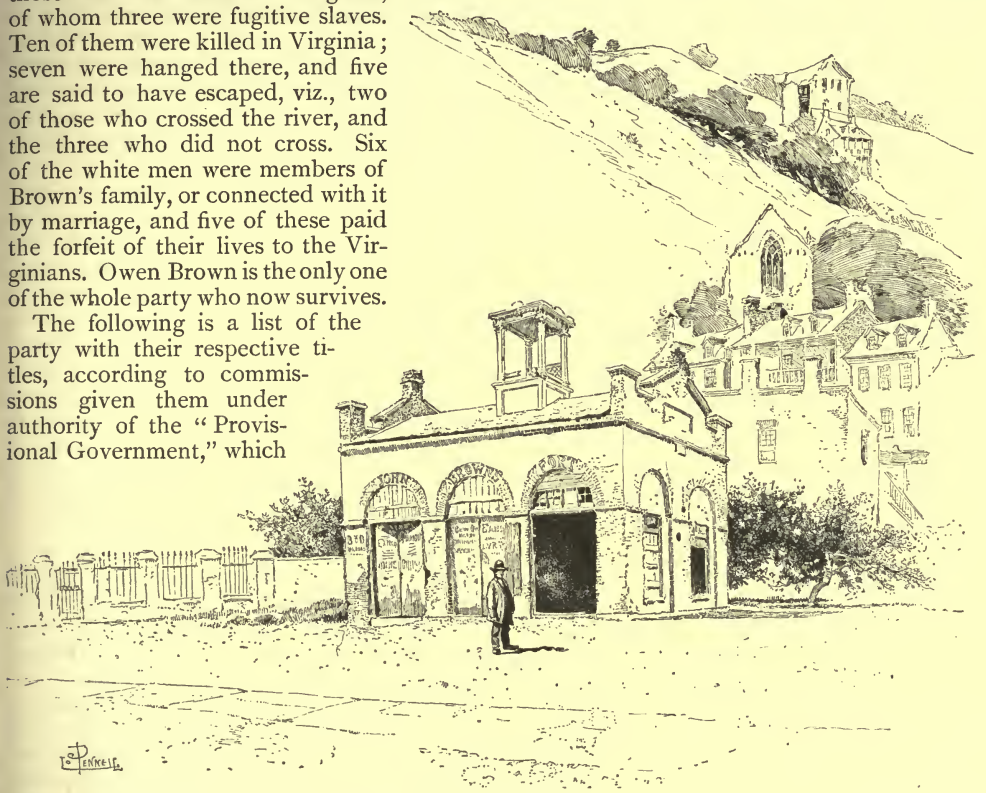
Having thus secured a suitable hiding-place, his men began to gather there,—coming from the North, one or two at a time, at intervals, and generally in the night. Meanwhile, there also arrived quietly from the same quarter—great precautions being used to conceal their destination as well as their contents—a number of boxes filled with guns, pistols, pikes, powder, and percussion caps, together with fixed ammunition, swords, bayonets, blankets, canvas for tents, tools of all kinds, maps and stationery,; so that few camps were ever more fully supplied for an active campaign than was Old John Brown's mountain aerie.

Sunday night, October 16th, was fixed for the foray; and at eight o'clock that evening, Brown said to his companions: "Come, men, get on your arms; we will proceed to the Ferry." They took with them a one-horse wagon, in which were placed a parcel of pikes, torches, and some tools, including a crow-bar

and sledge-hammer, and in which also Brown himself rode as far as the Ferry.

Brown's actual force, all told, consisted of only twenty-two men including himself, three of whom never crossed the Potomac. Five of those who did cross were negroes, of whom three were fugitive slaves. Ten of them were killed in Virginia; seven were hanged there, and five are said to have escaped, viz., two of those who crossed the river, and the three who did not cross. Six of the white men were members of Brown's family, or connected with it by marriage, and five of these paid the forfeit of their lives to the Virginians. Owen Brown is the only one of the whole party who now survives.

The following is a list of the party with their respective titles, according to commissions given them under authority of the "Provisional Government," which among the actual invaders who did not hold commissions—all compliments of that kind having been monopolized by the white men of the party, as a practical commentary on their professions of fraternity and equality.



JOHN BROWN'S FORT.

Brown intended to establish in the South, the constitution for which had been adopted by "a quiet convention," held in Canada for the purpose, over which Brown presided: John Brown, "commander-in-chief"; John Henry Kagi, "adjutant, second in command," and "secretary of war"; Aaron C. Stevens, "captain"; Watson Brown, "captain"; Oliver Brown, "captain"; John E. Cook, "captain"; Charles Plummer Tidd, "captain"; William H. Leeman, "lieutenant"; Albert Hazlett, "lieutenant;" Owen Brown, "lieutenant"; Jeremiah G. Anderson, "lieutenant"; Edwin Coppic, "lieutenant"; William Thompson, "lieutenant"; Dauphin Thompson, "lieutenant"; *Shields Green; Dangerfield Newby; John A. Copeland; Osborn P. Anderson; Lewis Leary;* Stewart Taylor; Barclay Coppic, and Francis Jackson Merriam. The three last named were left at the Kennedy farm as a guard, and did not cross the river; the five names italicized were colored men, and the only persons, The army, so fully officered beforehand, was not yet raised. According to certain "general orders," issued by Brown, October 10th, a week before his raid, his forces were to be "divided into battalions of four companies, which would contain, when full, seventy-two men including officers in each company, or two hundred and eighty-eight in the battalion. Each company was to be divided into "bands" of seven men under a corporal, and every two "bands" made a "section" under a sergeant.

When Brown's party arrived opposite the Ferry at the entrance to the Baltimore and Ohio Railroad bridge over the Potomac,—along the side of which there was, as now, a wagon road,—two of the number (Cook and Tidd) were detailed to tear down the telegraph wires, while two more (Kagi and Stevens), crossing the bridge in advance of the others, captured the night-watchman, whose name was Williams, and who was entirely too old to make any effective resist-

ance. Leaving Watson Brown and Stewart Taylor as a guard at the Virginia end of the bridge, and taking old Williams, the watchman, with them, the rest of the company proceeded with Brown and his one-horse wagon to the gate of the United States armory, which was not more than sixty yards distant from the bridge. Finding it locked, they peremptorily ordered the armory watchman, Daniel Whelan, who was on the inner side of the gate, to open it, which he as peremptorily refused to do. In his testimony before the U. S. Senate committee, of which Mr. Mason of Virginia was chairman, Whelan described this scene so graphically that I here quote a part of it, as follows:

"'Open the gate!' said they. I said 'I could not if I was stuck,' and one of them jumped up on the pier of the gate over my head, and another fellow ran and put his hand on me and caught me by the coat and held me. I was inside and they were outside, and the fellow standing over my head upon the pier. And then, when I would not open the gate for them, five or six ran from the wagon, clapped their guns against my breast, and told me I should deliver up the key. I told them I could not, and another fellow said they had not time now to be waiting for a key, but to go to the wagon and bring out a crowbar and a large hammer and they would soon get in."

After telling how, with their crowbar and sledge, they broke the fastenings of the gate, Whelan went on to testify:

"They told me to be very still and make no noise, or else they would put me to eternity. * * * After that, the head man of them, Brown, said to me: 'I came here from Kansas, and this is a slave State. I want to free all the negroes in this State; I have possession now of the United States armory, and if the citizens interfere with me I must only burn the town and have blood."

Edwin Coppic and Hazlett were next sent across the street to break into the United States arsenal, which stood within another inclosure and where there was no guard whatever; while, at the same time, Oliver Brown and William Thompson occupied the bridge over the Shenandoah near the arsenal, and Kagi, with John Copeland, went up the Shenandoah to the Government rifle-works, about half a mile above, where there was another superannuated and unarmed watchman to encounter, whom they likewise captured, and then they took possession of "the works."

It was now near midnight. Brown's next step was to dispatch Stevens, Cook, and others, six in all, to the country to capture my life-long friend and college-mate Colonel Lewis W. Washington, and also to kidnap his negroes. In capturing Colonel Washington, they also seized the historic dress-sword which had been given by Frederick the Great to George Washington, with the memorable words: "From the oldest soldier to the greatest," together with one of a pair of pistols presented by La Fayette to General Washington, and some other valuable arms. They brought Colonel Washington to Harper's Ferry in his own carriage, and his negro men in his four-horse farm-wagon,—stopping on their way at the house of another farmer, Mr. Alstadt, whom they likewise took prisoner, together with his son and men-servants, all of whom were taken under guard to Brown at the armory, arriving there before daylight.

In the meantime, the eastern-bound passenger train on the Baltimore and Ohio Railroad arrived at the Ferry after midnight, and was detained there until daylight by Brown's order, his son Watson stopping the train as it approached the station. The passengers were at a loss to comprehend the cause of the delay, some of them supposing it to be a strike of railroad hands, and others thinking it was an émeute among the armorers. While they were yet in ignorance of the real cause, an incident occurred at about half-past one o'clock which served sufficiently to show, at least, the murderous character of the insurgents.

Shepherd Haywood, one of the most respectable free negroes in the county and the regular railroad porter, employed to look after the luggage of passengers, had occasion to see the night-watchman, Williams, whose post of duty was on the bridge.

After calling him once or twice and getting no response, he walked out upon the bridge. But he had gotten only a short distance from the entrance of the bridge, when he was confronted by two strange men, who, pointing their guns at him, commanded him to halt. The poor fellow was naturally frightened, and, either mistaking the purport of the order, or else confused by the suddenness of the summons, turned around to go back to the railroad office, when he was fired upon by Watson Brown and Stewart Taylor, one of their balls inflicting a mortal wound. Haywood died between twelve and one o'clock the next day.

This was the first victim of the foray, and there is a suggestive significance in the fact that it was an inoffensive free negro, and that his assassination was as cowardly as it was cruel and uncalled for. This firing was the first intimation that any of the citizens of the Ferry had — except, of course, the captured watchmen — that there was an enemy in their midst. Several persons living near the bridge were awakened by it, some of whom got up and looked out of their windows to ascertain the cause. But as they heard nothing more, and it was too dark to distinguish objects a few feet from them, they concluded that the

noise had been occasioned by midnight revelers shooting off their pistols in sport, and they returned to their beds.

One of these awakened citizens, however, Dr. Starry, was not so easily contented to lie down again without looking a little further into the matter, as he had heard a cry of distress following the shots, and his professional instincts prompted him to go to the relief of the sufferer. The wounded negro had managed to make his way back to the office of Mr. Beckham, the railroad agent, where the Doctor found him lying upon the floor, writhing in agony. After doing what he could to make him more comfortable, and having learned from him the circumstances under which he had been shot, the Doctor started out to investigate more fully the situation.

When he had watched the movements of the raiders for some time and from different points of observation, he was enabled to form an idea of what they had done and were then doing, though not of their ulterior designs; for he thought that their only object was robbery. With this idea in his mind he determined to arouse Mr. Kitzmiller, the chief clerk, who, in the absence of Colonel Alfred H. Barbour, the superintendent, had official charge of the armories. So, getting out his horse, he made his way to Kitzmiller's house, which was in quite a different part of the town; and having informed him of the condition of things at the armory, he rode on to Bolivar and elsewhere, arousing the people as he went. By this time it was broad daylight, and some of the citizens were appearing in the streets. Such of them, in the lower part of the town near the Government works, as had occasion to pass down Shenandoah and High streets, were surprised to see them picketed near their intersection, and, as may be supposed, their surprise was not diminished on being rudely told they were prisoners and being unceremoniously marched to a building in the armory yard which Brown had appropriated as headquarters for himself and as a "calaboose" for his captives, of whom some thirty or forty altogether were thus taken and held by him.

One of the citzens by the name of Boerley, —a well-to-do grocer, and an Irishman by birth,—when walking quietly along not far from his residence, happened to get within range of a picket,—a black fellow who called himself Dangerfield Newby,—whereupon the negro raised his rifle and without a word of warning shot him dead, with as little compunction as if he had been a mad dog.

It was now about seven o'clock, by which time most of the people of the town had been warned of the raid and its real object. Accordingly, messengers were sent for assistance to the neighboring towns, while prompt and effective steps were taken by the citizens of the Ferry to resist the insurgents, whose force was supposed to be far greater than it really was, from the fact of Brown's making an ostentatious display of sentinels outside of the armory buildings while keeping up from their interiors a desultory fire upon the citizens, when any of them appeared in sight.

There was unavoidable delay in the preparations for a fight, because of the scarcity of weapons; for only a few squirrel guns and fowling-pieces could be found. There were then at Harper's Ferry thousands and tens of thousands of muskets and rifles of the most approved patterns, but they were all boxed up in the arsenal, and the arsenal was in the hands of the enemy. And such, too, was the scarcity of ammunition that, after using up the limited supply of lead found in the village stores, pewter plates and spoons had to be melted and molded into bullets for the occasion.

By nine o'clock a number of indifferently armed citizens assembled on Camp Hill and decided that the party, consisting of half a dozen men, should cross the Potomac a short distance above the Ferry, and, going down the tow-path of the Chesapeake and Ohio Canal as far as the railway bridge, should attack the two sentinels stationed there, who, by the way, had been reënforced by four more of Brown's party. Another small party under Captain Medler was to cross the Shenandoah and take position opposite the rifle works, while Captain Avis, with a sufficient force, should take possession of the Shenandoah bridge, and Captain Roderick, with some of the armorers, should post themselves on the Baltimore and Ohio Railway west of the Ferry just above the armories.

These movements and dispositions were made with commendable promptness under the general direction of Colonels Robert W. Baylor and John T. Gibson—the former being the ranking officer by right of seniority. Thus was cut off Brown's retreat to the mountains in Maryland across the Potomac, or to those in Virginia across the Shenandoah. Shortly after the first of the above-mentioned parties had crossed the Potomac and driven the enemy's sentinels from the Maryland end of the bridge to its Virginia entrance, the "Jefferson Guards," under Captain Moore, and the "Botts Greys," under Captain Lawson Botts, arrived at the Ferry from Charlestown; and the former company being immediately sent over the river at the "Old Furnace," to reënforce those who had crossed before them into Maryland, as soon as they had reached the railway bridge charged across it, killing one of the insurgent sentinels and capturing another

(William Thompson), whom they confined in the railway hotel facing the bridge.

Cook and Tidd, of Brown's party, were at this time in Maryland, having been sent early in the morning to the Kennedy farm with Colonel Washington's farm-wagon and some of his servants to bring down the boxes of Sharpe rifles, Ames pistols, pikes, etc., to a school-house about a mile above the Ferry, which was intended to be a convenient depot of supplies for the raiders in the event of their falling back into Maryland. So, of course, as the bridge was no longer in possession of the insurgents, they were unable to rejoin their companions now cooped up in the armories and rifle works. Just after the Botts Greys reached the Ferry, a man reported to its captain that he had come from the "Gault House" (a small tavern situated near the arsenal at the junction of the two rivers commanding the mouth of the bridge and a view of the armory yard), where there was but one man, its proprietor (George Chambers), who was maintaining an unequal skirmish with the raiders, had but one load left for his gun, and wanted reënforcements.

Captain Botts called for twenty volunteers to go with him, and more than twice the number stepped out from the ranks. They had great difficulty in getting to the tavern, being obliged, in order to avoid a raking fire from the raiders, to make a detour around the base of the hill under "Jefferson's Rock," and along the bank of the Shenandoah, and then to climb up a wall thirty feet high so as to enter the house by a cellar window, reaching their destination just as Chambers fired his last shot, which wounded the insurgent Stevens.

About the same time, Mr. George Turner, who had the respect and esteem of the entire community, was killed. He was a graduate of West Point. When he heard that his friend, Colonel Lewis Washington, had been forcibly abducted by a band of ruffians, and was a prisoner in their hands, he started at once for the Ferry. As he rode into the upper part of the town, some one handed him a shot-gun for his protection. Dismounting from his horse, he walked down High street, which runs parallel with and only a few paces from the long range of buildings in the armory grounds. When he had approached within some fifty yards of the corner of High and Shenandoah streets, the same negro — Dangerfield Newby — who had killed Boerley, saw him coming, and, taking deliberate aim, shot him dead. But the assassin himself was soon made to bite the dust. For one of the armorers, by the name of Bogert, a few minutes afterward got the opportunity of a shot at him from an upper window of Mrs. Stephenson's house at the corner of High and Shenandoah streets, and killed him on the spot. I saw his body while it was yet warm as it lay on the pavement in front of the arsenal yard, and I never saw, on any battle-field, a more hideous musket-wound than his. For his throat was cut literally from ear to ear, which was afterward accounted for by the fact that the armorer, having no bullets, had charged his musket with a six-inch iron spike.

As already mentioned, it was a little before noon when I reached Harper's Ferry on the day of the raid. By that time Brown and those of his party who were with him in the armory buildings were completely hemmed in. The bridges over both rivers, north and east, together with the western or upper end of the armory grounds, were in possession of the citizens, who occupied every "coign of vantage" from which they could get a fair shot at the insurgents, who, on their part, fighting from under cover of the buildings, were equally on the alert to retaliate in kind, so that there was a lively little skirmish going on when I got there, which I watched for some time from an open space on High street overlooking the lower part of the armory yard. Seeing that there was no probability of the escape of the insurgents, surrounded as they were on all sides, — with the volunteer citizens on both flanks, the Potomac in their front, and in their rear the town, which was becoming rapidly filled with people from every portion of the county, and ascertaining, also, that no attempt would be made to take the armories by assault before the arrival of the volunteers from Martinsburg and Shepherdstown, — I returned to the upper part of the town, where I had left my horse, and rode around toward the rifle-works, getting there in time to see the assault made on them which drove Kagi and his party pell-mell out of the rear of the building into the Shenandoah River, where a very exciting scene occurred; for, as soon as the insurgents were recognized attempting to cross the river, there was a shout among the citizens, who opened a hot fire upon them from both banks.

The river at that point runs rippling over a rocky bed, and at ordinary stages of the water is easily forded. The raiders, finding their retreat to the opposite shore intercepted by Medler's men, made for a large flat rock near the middle of the stream. Before reaching it, however, Kagi fell and died in the water, apparently without a struggle. Four others reached the rock, where, for a while, they made an ineffectual stand, returning the fire of the citizens. But it was not long before two of them were killed outright and another prostrated by a mortal wound, leaving Copeland, a mulatto, standing alone and unharmed upon their rock of refuge.

Thereupon, a Harper's Ferry man, James H. Holt, dashed into the river, gun in hand, to capture Copeland, who, as he approached him, made a show of fight by pointing his gun at Holt, who halted and leveled his; but, to the surprise of the lookers-on, neither of their weapons were discharged, both having been rendered temporarily useless, as I afterward learned, from being wet. Holt, however, as he again advanced, continued to snap his gun, while Copeland did the same.

Reaching the rock, Holt clubbed his gun and we expected to see a hand to hand fight between them; but the mulatto, showing the white feather, flung down his weapon and surrendered. Copeland, when he was brought ashore, was badly frightened, and well he might be in the midst of the excited crowd who surrounded him, some of whom began to knot their handkerchiefs together, with ominous threats of "Lynch law." But better counsels prevailed, and he was taken before a magistrate, who committed him to jail to await his trial.

When I returned to my former place of observation on High street, the expected reënforcements from Martinsburg and Shepherdstown had arrived, as also a small body of cavalry under Lieutenant Hess, the latter of whom (dismounted) were, with the Shepherdstown company, posted on Shenandoah street near the armory gate at the lower or eastern end of the grounds, while the men from Martinsburg and those under Roderick prepared to charge the raiders from the upper or western end.

The charge, which I witnessed, was spirited and made in the face of the concentrated fire of Brown's party, who were forced to retreat into the engine-house near the armory gate, where nine or ten of the most prominent of the prisoners had been previously placed by Brown as hostages for his own safety and that of his companions. Watson Brown was wounded when this charge was made, also several of the citizens, among whom was a gallant young man by the name of George Wollet, whom I particularly noticed among the foremost of the Martinsburg men until he was disabled by a shot in his wrist. A young lawyer, also from Martinsburg, George Murphy, was wounded in the leg, and an old gentleman of the county, Mr. Watson, who was seventy-five years of age, had the stock of his gun shattered as he raised it to his shoulder to shoot. Thomas P. Young, of Charlestown, who was permanently disabled during the day, got his wound, too, I think, in this charge; but of this I am not so certain.

Brown, having now barricaded himself and prisoners in the engine-house,—a small but substantial building of brick, still standing,—said to "Phil," one of Alstadt's kidnapped servants, "You're a pretty stout-looking fellow; can't you knock a hole through there for me?" at the same time handing him some mason's tools with which he compelled him to make several loopholes in the walls through which to shoot. He also fastened, with ropes, the large double door of the house so as to permit its folding leaves (which opened inward) to be partly separated so that he might fire through that opening.

These arrangements having been hurriedly made, Brown and his men opened an indiscriminate fire upon the citizens. While they were thus shooting at every one they saw, without regard to his being armed or not, Mr. Fountain Beckham, station agent, who was then mayor of the town, happened to walk out upon the depot platform near his office; when, incautiously exposing himself, he was instantly shot down, though it was evident he was unarmed, as he had his hands in his pockets at the time. This was the fourth victim of the foray.

When Mr. Beckham's friends upon the platform saw him fall dead in their presence,—shot through the heart without a word of warning,—killed without having taken any part in the fight, notwithstanding the special provocation he had received that morning in having his favorite servant murdered by the men who had now caused his own death,—their rage became uncontrollable, and they impulsively rushed into the railroad hotel to take summary vengeance on the prisoner, Thompson, who was confined there. But the lady of the house, Miss Christine C. Fouke, a most estimable woman, placing herself in front of the prisoner, declared that as long as he was under the shelter of her roof she would protect him, with her life, from harm,—which for a time saved the prisoner from death. But the respite was a brief one, for the maddened crowd soon brought him forth upon the platform where he was immediately shot, and his body thrown over the parapet of the bridge into the river below.

One of the raiders, Leeman, was discovered trying to escape across the river; and having been fired on and wounded, an excited volunteer from Martinsburg waded out to where he was in the water and killed him, it was said, after he had surrendered.

Shortly after, the charge was made which brought Brown to bay in the engine-house; and while I was yet standing at the point on High street whence I had witnessed the fight, where there was an unobstructed view across the river, I heard the hum of a ball as it went singing by me, and presently it was followed by another which passed in unpleasant proximity to my head. There were several

persons with me at the time who were armed and who, discovering by the smoke that the shots, so evidently meant for ourselves, had come from a clump of small trees on the mountain side across the river, fired a volley in that direction which silenced the unseen marksman. I refer to this trifling incident only because it was mentioned by Cook in his "Confession," as follows:

"I saw," said he, "that our party were completely surrounded, and as I saw a body of men on High street firing down upon them, though they were about half a mile distant from me, I thought I would draw their fire upon myself; I therefore raised my rifle and took the best aim I could and fired. It had the desired effect, for the very instant the party returned it. Several shots were exchanged. The last one they fired at me cut a small limb I had hold of just below my hand, and gave me a fall of about fifteen feet, by which I was severely bruised, and my flesh somewhat lacerated."

It was now near nightfall, and the gathering gloom of a drizzly evening began to obscure surrounding objects, making it so difficult to distinguish them that, as if by common consent on both sides, active operations were suspended.

At this time a conference was held by three or four of the principal officers in command, to which two or three civilians, including myself, were invited,—the object of the consultation being to determine whether or not to take the engine-house by assault at once, or to wait until morning.

It was represented to us by the prisoners whom Brown had released, when he selected out of their number nine or ten to be held as hostages in the engine-house, that, if an attempt should be made to carry it by storm at night, it would be impossible to distinguish the hostages from the insurgents; and that Brown would probably place the former in front of his own party as a protection, and thereby cause them to receive the brunt of the attack.

It was also urged that the raiders were then as securely imprisoned in their place of refuge as if incarcerated in the county jail, and could be taken in the morning without much risk to our friends. Before deciding the question under consideration, it was thought proper, at any rate, to send Brown a summons to surrender, and a respectable farmer of the neighborhood, Mr. Samuel S—— was selected to make the demand,—a duty which he undertook very willingly, although it was not unattended with danger, as the usages of ordinary warfare had been more than once disregarded, during the day, by the belligerents on both sides. Mr. S. was a man of indomitable energy, undoubted courage, and of such a genial disposition as to make him a general favorite; but he was somewhat eccentric and so fond of using *sesquipedalia verba* that, occasionally, he was betrayed thereby into those peculiarities of speech which characterized the conversation of Mrs. Malaprop.

Tying a white handkerchief to the ferrule of a faded umbrella, he went forth upon his mission with a self-imposed gravity becoming his own appreciation of its importance.

Marching up to the door of the engine-house, he called out in stentorian tones.

"Who commands this fortification?"

"Captain Brown, of Kansas," was the answer, from within the building.

"Well, Captain Brown, of Kansas," continued Mr. S., with his voice pitched in the same high key, "I am sent here, sir, by the authorities in command, for to summon you to surrender; and, sir, I do it in the name of the Commonwealth of old Virginia—God bless her!"

"What terms do you offer?" inquired Brown.

"Terms!" exclaimed S. "I heard nothing said about them, sir, by those who sent me. What terms do you want?"

"I want to be allowed," said Brown, "to take my men and prisoners across the bridge to Maryland and as far up the river as the lock-house [which was about a mile above] where I will release the prisoners unharmed, provided no pursuit shall be made until I get beyond that point."

To which S. replied by saying:

"Captain, you'll have to put that down in writing."

"It's too dark to write," answered Brown.

"Pshaw!" said S.; "that's nonsense,—for you needn't tell me that an old soldier like you hasn't got all the modern conveniences. So, if you don't write your terms down, in black and white, I wont take 'em back to those who sent me."

Thereupon, a light was struck in the engine-house, and presently a piece of paper was handed out to S., on which Brown had written what he wished to have accorded him.

The proposed terms were, of course, inadmissible; and after the paper containing them had been read by two or three of us, it was handed to Lawson Botts, who threw it contemptuously upon the floor, and placing his foot on it, said:

"Gentlemen, this is adding insult to injury. I think we ought to storm the engine-house, and take those fellows without further delay."

But the representations of the released prisoners, already mentioned, caused the contemplated assault to be postponed for the night.

The next morning the first thing I learned was that Colonel Robert E. Lee and Lieutenant J. E. B. Stuart (both of whom subsequently gained fame as Confederate leaders) had arrived about midnight with a small body of marines from Washington, and that Colonel Lee had assumed command of all the forces assembled in the place. Having the pleasure of his acquaintance, I lost no time in calling upon him, when he informed me that he intended at once to take Brown and his party. Accordingly, at about seven o'clock, a detachment of marines—three of whom had heavy sledge-hammers—were marched up to the west end of the "watch-house" which hid them from the insurgents, and which was under the same roof as the engine-house, being separated from it only by a brick partition. Colonel Lee himself (who was not in uniform) took a position outside of the armory gate, within thirty paces of the engine-house, but protected from those within it by one of the heavy brick pillars of the railing that surrounded the inclosure.

All now being in readiness, Colonel Lee beckoned to Stuart, who, accompanied by a citizen displaying a flag of truce, approached the engine-house.

A parley then ensued between Stuart and Brown, which was watched with breathless interest by the crowd.

Although from the position I occupied (which was, probably, some sixty paces from the engine-house) I could not hear the conversation between them, I often afterward heard it detailed by Stuart, when sharing his tent or sitting with him by his camp fire, and therefore am enabled to confirm the correctness of the report of it, made by my friend and former comrade, Major John Esten Cooke, in a graphic account given by him. Stuart began by saying:

"You are Ossawattomie Brown, of Kansas?"

"Well, they do call me that sometimes, Lieutenant," said Brown.

"I thought I remembered meeting you in Kansas," continued Stuart. "This is a bad business you are engaged in, Captain. The United States troops have arrived, and I am sent to demand your surrender."

"Upon what terms?" asked Brown.

"The terms," replied Stuart, "are that you shall surrender to the officer commanding the troops, who will protect you and your men from the crowd, and guarantee you a fair trial by the civil authorities."

"I can't surrender on such terms," said Brown; "you must allow me to leave this place with my party and prisoners for the lock-house on the Maryland side. There I will release the prisoners, and as soon as this is done, you and your troops may fire on us and pursue us."

"I have no authority to agree to such an arrangement," said Stuart, "my orders being to demand your surrender on the terms I have stated."

"Well, Lieutenant," replied Brown, "I see we can't agree. You have the numbers on me, but you know we soldiers are not afraid of death. I would as leave die by a bullet as on the gallows."

"Is that your final answer, Captain?" inquired Stuart.

"Yes," said Brown.

This closed the interview. Thereupon Stuart bowed, and as he turned to leave made a sign, previously agreed upon, to Colonel Lee, who immediately raised his hand, which was the signal of assault. Instantly the storming party under Lieutenant Green, consisting of a dozen marines, sprang forward from behind the angle of the wall that had concealed them, and for perhaps two minutes or more the blows of the sledge-hammers on the door of the engine-house sounded with startling distinctness, and were reëchoed from the rocky sides of the lofty mountains that rose in all their rugged majesty around us.

As yet, to our surprise, there was no shot fired by the insurgents, nor any sound heard from within the engine-house. Unable to batter down its doors, the men with the sledges threw them aside, at a sign from Stuart, and withdrew behind the adjoining building. Then there was a brief pause of oppressive silence, as some twenty-five or thirty more marines were seen coming down the yard with a long ladder that had been leaning against one of the shops. Nearing the engine-house they started into a run, and dashed their improvised battering ram against the door with a crashing sound, but not with sufficient force to effect an entrance. Falling back a short distance they made another run, delivering another blow, and as they did so a volley was fired by the conspirators, and two of the marines let go the ladder—both wounded and one of them mortally. Two others quickly took their places, and the third blow, splintering the right-hand leaf of the door, caused it to lean inward sufficiently to admit a man. Just then Lieutenant Green, who had been standing close to the wall, sword in hand, leaped upon the inclining door-leaf, which, yielding to his weight, fell inside and he himself disappeared from our view in the interior of the building. There was a shot, some inarticulate exclamations, and a short struggle inside the engine-house, and then, as our rescued friends emerged from the smoke that filled it, followed by marines bringing out the

prisoners, the pent-up feelings of the spectators found appropriate expression in a general shout.

As Colonel Lewis Washington came out I hastened to him with my congratulations, and to my inquiry:

"Lewis, old fellow, how do you feel?"

He replied, with characteristic emphasis:

"Feel! Why, I feel as hungry as a hound and as dry as a powder-horn; for, only think of it, I've not had anything to eat for forty odd hours, and nothing better to drink than water out of a horse-bucket!"

He told me that when Lieutenant Green leaped into the engine-house, he greeted him with the exclamation: "God bless you, Green! There's Brown!" at the same time pointing out to him the brave but unscrupulous old fanatic, who, having discharged his rifle, had seized a spear, and was yet in the half-kneeling position he had assumed when he fired his last shot. He said, also, that the cut which Green made at Brown would undoubtedly have cleft his skull, if the point of his sword had not caught on a rope, which of course weakened the force of the blow; but it was sufficient to cause him to fall to the floor and relax his hold upon the spear, which, by the way, I took possession of as a relic of the raid.

Within the engine-house one of Brown's party was found lying dead on the floor, and another (Watson Brown) was stretched out on a bench at the right-hand side of the door, and seemed to be in a dying condition. John Brown himself had been brought out and was then lying on the grass; but so great was the curiosity to see him that the soldiers found some difficulty in keeping back the crowd, and Colonel Lee consequently had him removed to a room in an adjoining building, strictly guarded by sentinels, where, shortly afterward, I had an interview with him, the particulars of which have remained distinctly impressed upon my memory.

On entering the room where he was I found him alone, lying on the floor on his left side, and with his back turned toward me. The right side of his face was smeared with blood from the sword-cut on his head, causing his grim and grizzly countenance to look like that of some aboriginal savage with his war-paint on. Approaching him, I began the conversation with the inquiry:

"Captain Brown, are you hurt anywhere except on your head?"

"Yes, in my side,—here," said he, indicating the place with his hand.

I then told him that a surgeon would be in presently to attend to his wounds, and expressed the hope that they were not very serious. Thereupon he asked me who I was, and on giving him my name he muttered as if speaking to himself:

"Yes, yes,—I know now,—member of Congress—this district."

I then asked the question:

"Captain, what brought you here?"

"To free your slaves," was the reply.

"How did you expect to accomplish it with the small force you brought with you?"

"I expected help," said he.

"Where, whence, and from whom, Captain, did you expect it?"

"Here and from elsewhere," he answered.

"Did you expect to get assistance from whites here as well as from the blacks?" was my next question.

"I did," he replied.

"Then," said I, "you have been disappointed in not getting it from either?"

"Yes," he muttered, "I have—been—disappointed."

I then asked him who planned his movement on Harper's Ferry, to which he replied: "I planned it all myself," and upon my remarking that it was a sad affair for him and the country, and that I trusted no one would follow his example by undertaking a similar raid, he made no response. I next inquired if he had any family besides the sons who had accompanied him on his incursion, to which he replied by telling me he had a wife and children in the State of New York at North Elba, and on my then asking if he would like to write to them and let them know how he was, he quickly responded:

"Yes, I would like to send them a letter."

"Very well," said I, "you will doubtless be permitted to do so. But, Captain," I added, "probably you understand that, being in the hands of the civil authorities of the State, your letters will have to be seen by them before they can be sent."

"Certainly," said he.

"Then, with that understanding," continued I, "there will, I'm sure, be no objections to your writing home; and although I myself have no authority in the premises, I promise to do what I can to have your wishes in that respect complied with."

"Thank you—thank you, sir," said he, repeating his acknowledgment for the proffered favor and, for the first time, turning his face toward me.

In my desire to hear him distinctly I had placed myself by his side, with one knee resting on the floor; so that, when he turned, it brought his face quite close to mine, and I remember well the earnest gaze of the gray ye that looked straight into mine. I then remarked:

"Captain, we too have wives and chil-

dren. This attempt of yours to interfere with our slaves has created great excitement, and naturally causes anxiety on account of our families. Now, let me ask you: Is this failure of yours likely to be followed by similar attempts to create disaffection among our servants and bring upon our homes the horrors of a servile war?"

"Time will show," was his significant reply.

Just then a Catholic priest appeared at the door of the room. He had been administering the last consolations of religion to Quinn the marine, who was dying in the adjoining office; and the moment Brown saw him he became violently angry, and plainly showed, by the expression of his countenance, how capable he was of feeling "hatred, malice, and all uncharitableness."

"Go out of here — I don't want you about me — go out!" was the salutation he gave the priest, who, bowing gravely, immediately retired. Whereupon I arose from the floor, and bidding Brown good-morning, likewise left him.

In the entry leading to the room where Brown was, I met Major Russell, of the marine corps, who was going in to see him, and I detailed to him the conversation I had just had. Meeting the major subsequently he told me that when he entered the apartment Brown was standing up — with his clothes unfastened — examining the wound in his side, and that as soon as he saw him he forthwith resumed his former position on the floor; which incident tended to confirm the impression I had already formed, that there was a good deal of vitality left in the old man, notwithstanding his wounds,— a fact more fully developed that evening after I had left Harper's Ferry for home, when he had his spirited and historic talk with Wise, Hunter, and Vallandigham.

Between the time of his raid and his execution I saw Brown several times, and was sitting near him in the court-room when sentence of death was pronounced upon him, during which he was apparently the least interested person present. Of course, I did not witness his execution, as I had seen quite enough of horrors at Harper's Ferry, little dreaming of those, ten thousand times more terrible, which I was yet to witness as among the results of the John Brown raid.

Alexander R. Boteler.

COMMENT BY A RADICAL ABOLITIONIST.

It is hard — nay, impossible — to carry the reader of these pages in 1883 back in memory to that period of our country's history when John Brown captured the town and arsenal at Harper's Ferry, or make real to ourselves the despotism which a few slaveholders then exercised over the rest of mankind in this country. Though a meager minority in their own South, they absolutely controlled there not only four millions of slaves, but six millions of white people, nominally free, while they directed the policy and the opinions of more than half the free people of the non-slaveholding States. They had dictated the nomination and secured the election of Buchanan as President,— the most complete servant of the slave power who ever held that office; they had not only refused to terminate the slave-trade (as by treaty we were bound to assist in doing), but they had induced the importation of a few cargoes of slaves into Carolina and Georgia; they had broken down the Missouri compromise of 1820 (imposed by themselves on the unwilling North), and had done their best to extend slavery over the new territories of the nation, and to legalize its existence in all the Free States. Through the mouth of Chief-Justice Taney, who simply uttered the decrees of the slave-holding oligarchy, they had made the Supreme Court declare that four million Americans, of African descent, had practically "no rights which a white man was bound to respect"; and they exerted themselves in every way to give due effect to that dictum. The Dred Scott decision was given by Taney in 1857, and it led at once to the execution of John Brown's long-cherished purpose of striking a blow at slavery in its own Virginian stronghold. That decision flashed into the minds of Northern men the conviction which John Quincy Adams had long before formulated and expressed — that "the preservation, propagation, and perpetuation of slavery was the vital and animating spirit of the national Government." It was this conviction that led to the election of Abraham Lincoln in 1860, as it had led John Brown and his small band of followers to form their conspiracy and begin their campaign in 1858–'59.

While the unpaid labor of the slaves was believed by the slave-holders to be the real source of our national prosperity, it was the merit and the fate of John Brown first to see and act upon the sad knowledge that slavery and our national existence were incompatible. Thirty years before he died for the blacks in Virginia, he chose the side of the nation against slavery; and in less than ten years after his death the whole people followed

in the path he had marked out—the straight and thorny road of emancipation by force.

It is in this broad way that the Harper's Ferry raid must be looked at,—not as a midnight foray of robbers and murderers. It was an act of war, and was accepted by the South as a sure omen that war was at hand. Brown told the slave-holders this in his famous conversation with Mason of Virginia and Vallandigham of Ohio. "I claim to be here," he said, "carrying out a measure I believe to be perfectly justifiable, and not to be acting the part of an incendiary or ruffian; on the contrary, I am here to aid those suffering under a great wrong. I wish to say, furthermore, that you had better—all you people of the South—prepare yourselves for a settlement of this question. It must come up for settlement sooner than you are prepared for it, and the sooner you commence that preparation the better for you. You may dispose of me very easily. I am nearly disposed of now. But this question is still to be settled; this negro question, I mean. The end of that is not yet." This was a veritable "Thus saith the Lord"—as his hearers and the whole world soon found out. But to such as then doubted the message of the prophet Brown condescended to verify his credentials in that wonderfully eloquent speech to the court that sentenced him to the gallows:

"This court acknowledges, as I suppose, the validity of the Law of God. I see a book kissed here, which I suppose to be the Bible or, at least, the New Testament. That teaches me, 'that all things whatsoever I would that men should do unto me, I should do even so to them.' It teaches me further, to 'remember them that are in bonds as bound with them.' I endeavored to act up to that instruction. I say I am yet too young to understand that God is any respecter of persons. I believe that to have interfered as I have done—as I have always freely admitted I have done—in behalf of His despised poor, was not wrong but right."

There was John Brown's authority for the capture of Harper's Ferry,—the same which Ethan Allen alleged, with less reason, at Ticonderoga, where he commanded surrender "in the name of the great Jehovah." Brown "had gone to be a soldier in the army of the Lord" long before his death, and the songs of the people marching to avenge that death were but the public proclamation of his commission from above. Since the details of that strange conversation with Mason of Virginia have faded from the popular memory, let me quote another passage in which Brown pursues the same line of reasoning he afterward held in court.

"SENATOR MASON: How do you justify your acts?

CAPTAIN BROWN: I think, my friend, you are guilty of a great wrong against God and humanity,—I say it without wishing to be offensive,—and it would be perfectly right for any one to interfere with you so far as to free those you willfully and wickedly hold in bondage. I do not say this insultingly.

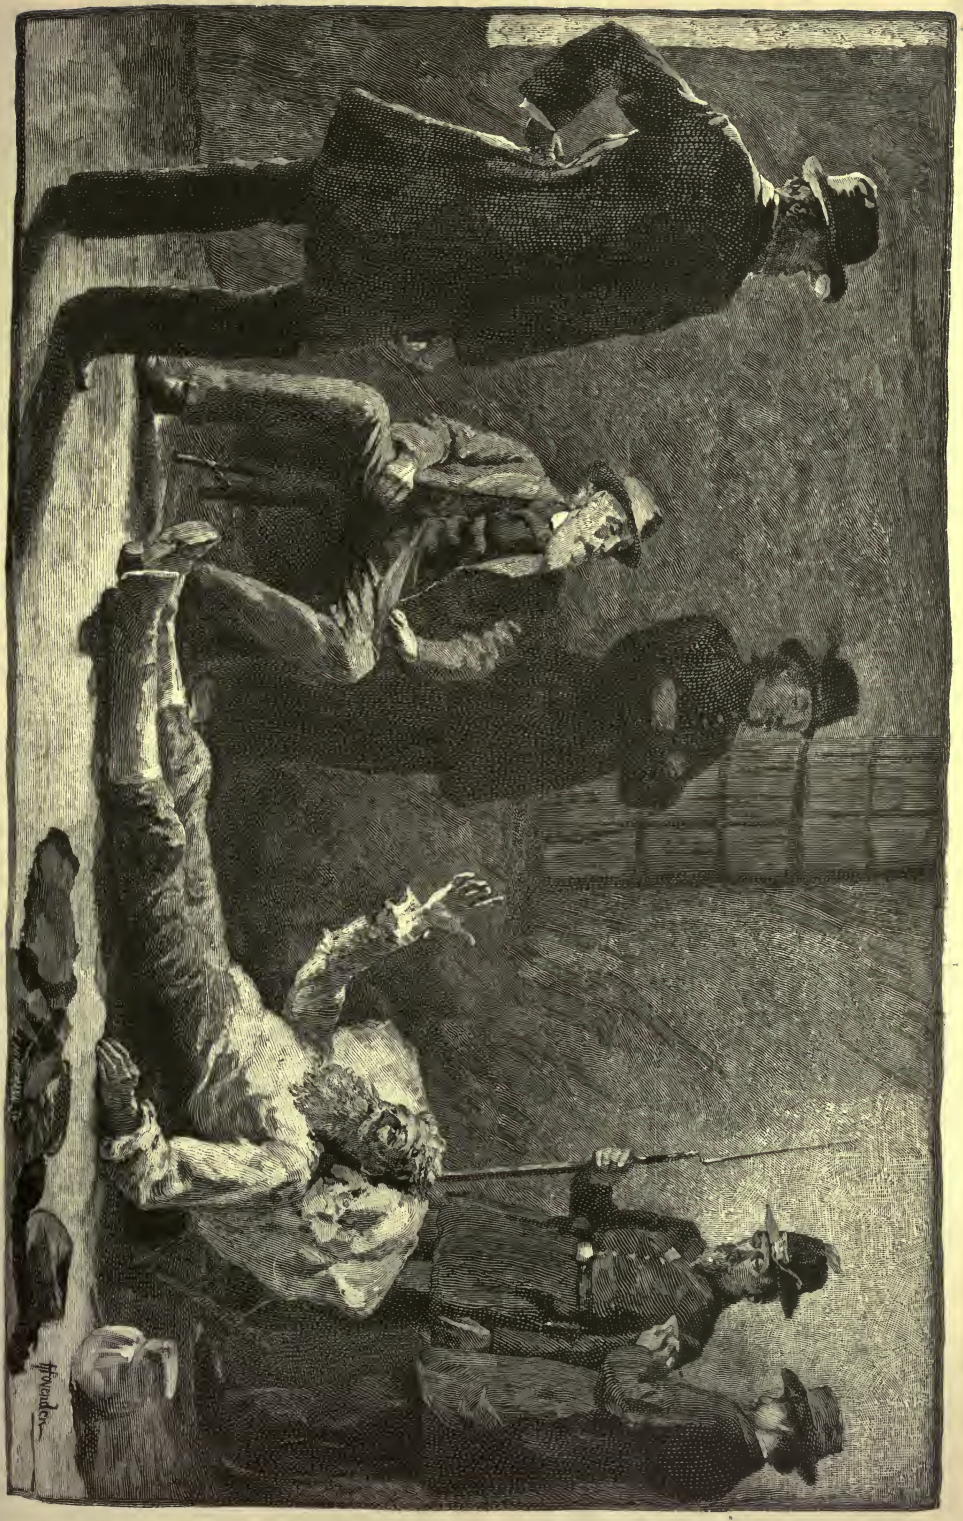
SENATOR MASON: I understand that.

CAPTAIN BROWN: I think I did right, and that others will do right who interfere with you, at any time, and all times. I hold that the golden rule, 'Do unto others as you would that others should do unto you,' applies to all who would help others to gain their liberty.

LIEUTENANT STUART: But you don't believe in the Bible?

CAPTAIN BROWN: Certainly I do. * * * I want you to understand, gentlemen, that I respect the rights of the poorest and weakest of the colored people, oppressed by the slave system, just as much as I do those of the most wealthy and powerful. That is the idea that has moved me, and that alone. We expected no reward except the satisfaction of endeavoring to do for those in distress—the greatly oppressed—as we would be done by. The cry of distress of the oppressed is my reason, and the only thing that prompted me to come here."

Brown's plan of action in Virginia was wholly his own, as he more than once declared; and it was not until he had long formed and matured it that he made it known (so far as an attack on slavery in Virginia was concerned) to the few friends who shared his confidence in that matter. I cannot say how numerous these were; but beyond his own family and the armed followers who accompanied him, I have never supposed that his Virginia plan was known to fifty persons. Even to those few it was not fully communicated, though they knew that he meant to fortify himself somewhere in the mountains of Virginia or Tennessee, and from that fastness, with his band of soldiers, sally out and liberate slaves by force. His plan to this extent was known, early in 1858, by Frederick Douglass, Gerrit Smith (at whose house and in whose presence I first heard Brown declare it), Theodore Parker, Dr. S. G. Howe, George L. Stearns, T. W. Higginson, and myself, and we all raised money to aid Brown in carrying this plan forward. I know this, because some of the money and nearly all the correspondence relating to the contributions passed through my hands in 1858–9. I talked more than once in those years with all the persons above named, concerning Brown's Virginia plan, and had letters from all except Douglass in regard to it. Brown's general purpose of attacking slavery by force, in Missouri or elsewhere, was known in 1857–8–9 to R. W. Emerson, A. Bronson Alcott, Henry Thoreau, Wendell Phillips, Thomas Russell, John A. Andrew, and others of the anti-slavery men of Massachusetts, none of whom discountenanced it, while most of them, in my hearing, distinctly approved it, generally, however, as a last resort or a measure of retaliation for the outrages of the



JOHN BROWN AFTER HIS CAPTURE.

slave-holders and their allies. Had these gentlemen known of the Virginia plan, most of them would have strongly disapproved it as premature or impracticable. Such, also, it seemed at first, and generally afterward, to those of us who contributed money to aid Brown in it. I speak particularly of Gerrit Smith, Theodore Parker, George L. Stearns, Dr. Howe, Col. Higginson, and myself. But we all felt, as Governor Andrew afterward said, that whatever the old worthy might plan or do, "John Brown himself was *right*," and upon that feeling we acted, in spite of doubts and many misgivings. The end has justified our instinctive sentiment; and it has more than justified, it has glorified Brown. I do not wonder that Virginians cannot all see this yet; but the world sees it, and Brown has become, to the world in general, one of the immortal champions of liberty—historical or mythical—among whom we reckon Leonidas, Maccabeus, Tell, Winkelried, Wallace, Hofer, and Marco Bozzaris.

I knew John Brown well. He was often at my house and at the houses of my friends, and I traveled with him for days. He was what all his speeches, letters, and actions avouch him—a simple, brave, heroic person, incapable of anything selfish or base. The higher elements of his character are well seen in the portrait which accompanies these pages. There were darker and sterner traits which fitted him for the grim work he had to do, and which are better shown in his bearded portraits, and in some which I possess, taken in the year 1857. But the face that here looks out upon us bespeaks that warm love for God's despised poor which was his deepest trait, and that noble disregard of everything but justice which distinguished his every action. But above and beyond these personal qualities he was what we may best term a *historic* character; that is, he had, like Cromwell and Spartacus, a certain predestined relation to the political crisis of his time, for which his character fitted him and which, had he striven against it, he could not avoid. Like Cromwell and all the great Calvinists, he was an unquestioning believer in God's fore-ordination and the divine guidance of human affairs; but he was free from the taint of guile that disfigured Cromwell's greatness. Of course, he could not rank with Cromwell or with many inferior men in leadership; but in this God-appointed, inflexible devotion to his object in life he was inferior to no man, and he rose in fame far above more gifted persons because of this very fixedness and simplicity of character. His renown is secure, and the artless (I must think prejudiced) narrative of Mr. Boteler does but increase it for those who read understandingly. As Tennyson said of the great Duke, we may say of Brown:

> "Whatever record leap to light,
> He never shall be shamed."

Young men never knew, perhaps, and some old men have forgotten, that we once had statesmen (so called) who loudly declared that negro slavery was the basis not only of our national greatness, but of the white man's freedom. This groveling doctrine found favor in Virginia in John Brown's time, and it was his work, as much as any man's, to overthrow it. A hundred years ago one of the great Virginians, a statesman indeed by nature and by training, said:

> "With what execration should that statesman be loaded who, permitting one-half the citizens to trample on the rights of the other, transforms those into despots and these into enemies? Can the liberties of a nation be deemed secure when we have removed their only firm basis—a conviction in the minds of the people that these liberties are the gift of God, that they are not to be violated without his wrath? Indeed, I tremble for my country (Virginia) when I reflect that God is just, that His justice cannot sleep forever; that, considering numbers, nature, and natural means only, a revolution of the wheel of fortune is among possible events; that it may become probable by supernatural interference. The Almighty has no attribute that can take sides with us in such a contest."

This was the language of Jefferson in his "Notes on Virginia," written in 1783, and it was in the county of Jefferson that Brown made his foray in 1859. He harbored in the county of Washington, in Maryland, for three months. He descended upon Jefferson County in Virginia at the end of that time; and when the astonished successors of Washington and Jefferson saw him first, he held in his hand Washington's sword, and was enacting Jefferson's Declaration of Independence in favor of the slaves of Colonel Washington,—that the Scriptures might be fulfilled. And they were fulfilled to the utmost in the years of war and ruin that followed.

At the critical period of that civil war when its issue was still undecided save in the councils of heaven,—at the close of the year 1862, Abraham Lincoln put forth his first edict of emancipation, and followed it up, January 1, 1863, with the final proclamation that the slaves in the rebellious States were from that day free. John Brown had been in his woodland grave among the Adirondack Mountains but little more than three years when we saw this triumph of his hopes, this crown of his toil and martyrdom. His friends gathered to celebrate so happy an event at the house of one of the most faithful and active of his supporters in the Virginia campaign, George Stearns, of Medford, in Massachusetts. It was one of the last of those meetings in which the old anti-slavery men and women came

together with hearts united, and rejoiced together face to face. Garrison and Phillips were there, Emerson and Alcott (Thoreau had died eight months before), Dr. Howe and his poetic wife, Mrs. Child, Moncure Conway, Martin Conway of Kansas, and many others now dead or widely sundered. The host and his wife, Mrs. Mary Stearns, who also had been an enthusiastic friend of John Brown, could give their guests not only the graceful hospitalities of a house always open to the friends of freedom, but, what was then a new sight, Brackett's marble bust of Brown, standing crowned with flowers in the wide hall. This is the only bust of Brown for which the sculptor studied the hero's own features, and it was made after a visit by Brackett to Brown in prison at Charlestown. Though not, in all respects, a portrait, it has the air of Brown, with a majesty that made Charles Sumner exclaim, when he first saw it: "This is like the Moses of Michael Angelo." And when a sibylline negress, a fugitive from Maryland, saw it in my house, she went into an ecstasy of grief and adoration, declaring that Brown was not a mere man, but the Messiah of her people.

"In a great age," says Cousin, speaking of Pascal, "everything is great." John Brown came to prominence in an age by no means grand or noble; but such was his own heroic character that he conferred importance on events in themselves trivial. His petty conflicts in Kansas and the details of his two days' campaign in Virginia will be remembered when a hundred battles of our civil war are forgotten. He was one of ten thousand, and, as Thoreau said, could not be tried by a jury of his peers, because his peers did not exist; yet so much was he in accord with what is best in the American character that he will stand in history for one type of our people, as Franklin and Lincoln do, but with a difference. He embodied the distinctive qualities of the Puritan, but with a strong tincture of the more humane sentiments of later times. No man could be more sincere in his faith toward God, more earnest in love for man; his belief in fore-ordination was absolute, his courage not less so. The emotion of fear seemed to be quite unknown to him, except in the form of diffidence,—if that were not rather a sort of pride. He was diffident of his power in speech or writing, yet who, of all his countrymen, has uttered more effective or immortal words?

Part of the service he rendered to his country was by this heroic impersonation of traits that all mankind recognize as noble. The cause of the poor slave had need of all the charm that romantic courage could give it; his defenders were treated with the contempt which attached to himself. They were looked upon with aversion by patriots; they were odious to trade, distasteful to fashion and learning, impious in the sight of the Church. At the single stroke of Brown, all this was changed; the cause that had been despised suddenly became hated, feared, and respected; and out of this new fear and hatred our national safety was born. Ten years more of disgraceful security, and the nation might have been lost; but the rash and frantic efforts of the South to defend its barbarous system brought on the revolution that has regenerated us politically. No doubt the affair at Harper's Ferry hastened our political crisis by at least ten years,—and what fatal years they might have been but for John Brown!

One evening in January, 1860, as I sat in Emerson's study at Concord, talking of this old friend of ours, for whose widow and orphans we were then raising a fund, I spoke to Emerson about a speech of his at Salem, a few weeks earlier, in which the poet-philosopher had renewed his homage to the memory of Brown. He went to one of the cabinets in which his manuscripts were kept, took out the half-dozen pages on which his remarks had been written down, and gave them to me for publication. I have ever since cherished the manuscript, in which, with bold strokes of his quill, Emerson had written these words at the close:

"It would be nearer the truth to say that all people, in proportion to their sensibility and self-respect, sympathize with John Brown. For it is impossible to see courage and disinterestedness and the love that casts out fear, without sympathy. All gentlemen, of course, are on his side. I do not mean by 'gentlemen' people of scented hair and perfumed handkerchiefs, but men of gentle blood and generosity, 'fulfilled with all nobleness'; who, like the Cid, give the outcast leper a share of their bed; like the dying Sidney, pass the cup of cold water to the wounded soldier who needs it more. For what is the oath of gentle blood and knighthood? What but to protect the weak and lowly against the strong oppressor? * * * Who makes the abolitionist? The slave-holder. The sentiment of mercy is the natural recoil which the laws of the universe provide to protect mankind from destruction by savage passions. The arch-abolitionist, older than Brown, and older than the Shenandoah Mountains, is Love, whose other name is Justice,—which was before Alfred, before Lycurgus, before Slavery and will be after it."

The generous, immortal traits which these words portray in Brown and bespeak in Emerson, are those which the artist has caught in the remarkable engraving of my old friend in this number of THE CENTURY.*

LA BOHÉMIENNE (THE GYPSY).

[ENGRAVED BY WILLIAM MILLER FROM THE PAINTING BY FRANS HALS IN THE LA CAZE COLLECTION IN THE LOUVRE.]

FRANS HALS.

If one of our younger American painters were asked to name those artists of bygone times whose influence is most potent in the studios to-day, he would surely cite Frans Hals among the very first. In Munich Hals has been of late the most dominant of artistic forces,—directly in his own work and indirectly in that of his pupil Adriaen Brouwer; in certain Parisian quarters his influence is almost as apparent; and many of our own young painters, who began in Paris or in Munich, have studied him later in his own land and have formed themselves largely by his example. It is neither to be wondered at nor to be regretted that such should be the case, since Hals was one of the very greatest painters who have ever lived. By this I do not mean one of the greatest *artists*. He shows no creative or poetic power, and only the kind of intellectual force which was needed to rank him high in the one branch he followed,—that of portraiture. But when we look at the technical side of his art, when we regard him simply as a practician, we must call him master above almost every other. "No man," says Fromentin, "ever *painted better*, and no man ever will."

Hals was held in the highest honor in his own time,—when, if ever, good painting was understood and prized,—but he was forgotten by the eighteenth century with its love for slight and superficial grace, and by the first quarter of our own with its delight in cold classicism of motive and colder formality of treatment. In the present day, however, when "realism" is the watchword and when devotion to clever and individual workmanship has become almost excessive, he has been re-discovered and eulogized afresh, put on a pedestal in the studios, and worshiped, with only Velasquez for his fellow, as "the painter's painter." Yet, with all his immense vogue among professionals and amateurs, his name and work are still not very familiar to the public—not even to the traveled public, which knows its galleries pretty well. This is partly because the public is not prepared to appreciate quite clearly the value of mere admirable workmanship, and partly because Hals must be seen at home to be understood, and his home lies a little off the highway of common travel. Comparatively few of his pictures are to be found out of the Netherlands, and these include none of his most important works and not many which show his technique in perfection. Really to know him, moreover, one must go not only to Holland but to Haarlem. Haarlem is Frans Hals as Parma was Correggio. But while Correggio has almost faded from the walls where he revealed himself, Hals is as living, as fresh, as powerful in his home to-day as when his models walked its streets.

Though born at Mechlin he belongs quite strictly to the Dutch school, for his parents were from Haarlem and he returned thither with them at an early age and seems to have painted there during the whole of his long life. It is interesting to note the strong and direct influence he is having on much of the current practice of our day, and then to trace how strong and direct was his influence while he lived. He was not only the greatest technician of the Dutch school, but the painter among all others who most forcibly impressed himself upon the development of that school. Some others—as Rembrandt, for example—gave rise to more slavish imitators; but not one so turned the current of the general practice of his time. Born in 1584 (twenty-three years before Rembrandt), it is doubtful with whom he studied. All we know is that he was the first to introduce into Holland the free, bold, synthetic way of working that Rubens had popularized among the Flemings. Not only portraiture, but landscape and *genre*, transformed themselves beneath his influence. Not only Vander Helst, but Brouwer and Ostade, owed everything to his teaching, and it is not too much to say that no Dutch painter came after him whose work would not have been different had Frans Hals never lived. Even of Rembrandt himself, this may strongly be affirmed.

The best of Hals's work is, as I have said, in Haarlem. Hanging together in the Academy are eight great canvases, each with many life-size figures—magnificent specimens of "Corporation" or "Regent Pieces," those huge portrait groups which are the finest and most distinctive creations of Dutch art. The earliest of them was painted when he was thirty-two years old, the last when he was eighty,—but two years before his death. And between these we find a progressive series, the finest examples dating from about his fiftieth year. It is impossible here to explain the technical perfection of these pictures, where he shows himself not so great an artist as Velasquez, but a painter whose workmanship is as transcendent, and who manages

at times, moreover, a wider and more difficult scale of color. Everything is fine and original,—color, tone, arrangement, character,—but it is the touch which is the really marvelous point,—swift, direct, spirited, broad and bold, yet faultlessly exact and sympathetic. No man's handling was ever more personal, more autographic, more wholly his own creation; and such individuality is, of course, a prime factor in great technical performance. No man's was ever franker. We can see how he worked—how he began and ended and laid every stroke—as clearly as though we had stood beside his elbow. No man ever wrought so daringly, so rapidly, so without pause, hesitation, addition or amendment,—yet so without a blemish. He is the most supremely audacious of painters; but we do not feel that his audacity was meant as such—only that he knew everything, and so had no reason to deliberate or fear. It is mere workmanship, of course, that I am praising. But workmanship is more than the half of art, and this of Hals's is so free, so true, so expressive, and so rarely individual, that it seems due to something like inspiration, and not to the study and reflection which guide the brush of others. No man, moreover, is less mannered in his style. His handling varies from ways which are merely free to those which are more boldly synthetic than any other painter ever used. His tone is now soft and gray, now golden and mellow, now dark and heavy. Now his models are resplendent in clear blue and yellow, and now a deep brown so pervades the canvas that scarce a local tint survives. He tried his hand, furthermore, on small canvases as well as large, still painting freely and vivaciously, of course, but with a wonderful adaptation of his style to narrow limits. There is, for example, a little picture some nine inches by seven in the Dresden gallery—the portrait of a saucy-looking cavalier in black velvet and white lace—which could not have been larger or freer had he swept a ten-foot canvas, yet in which the requirements of the scale are as artistically respected as they could have been by the most minute of workmen. And, though I have said that Frans Hals was not a *great* artist, I would explain that he is a true and a very good one. His grouping is admirably artistic, spirited, and harmonious. All his figures are alive and individual. His "Hospital Regents" are stately and dignified, his jolly "Archers" brimful of rollicking life; and when he paints for his own pleasure, his own portrait, or a fisherboy, or a musician, or a gypsy,—such a head as the one here reproduced,—he makes it so vivid with his own gay, laughter-loving impulses (drink-loving, too, if we must believe tradition), that it greets us from a gallery wall like an actual incarnation of his personal humor.

Unfortunately, as I have said, it is his less perfect works that are most familiar outside of Holland, a rather extreme example being the "Hille Bobbe," in our own Metropolitan Museum—a work where heavy browns replace the fine color and exquisite tone of his greater pictures, and where his execution is summary to a degree that just indicates the subject—that would be beyond the edge of license with any other hand. Hals's work, however, is always magnificent even when most rough-hewn, always truthful up to the given point, never "slap-dash," meaningless, or incoherent. But such a hand and face as are shown in the "Hille Bobbe" differ from hand and face in one of his finer portraits as a stenographer's notes differ from bold yet finished eloquence. Those who have an eye to read the language know what power of thought and vision lay behind it, what power of hand was necessary to its swift and true suggestiveness. But such work cannot reveal Frans Hals, the perfect painter, to eyes which have never seen his completer canvases.

The worship of such technicians as Hals and Velasquez has undoubtedly been of immense advantage to the rising generation of our artists. Perhaps it has sometimes induced a disregard, even a comparative contempt, for the other and more subtile artistic factors which must go with splendid workmanship to make up a splendid art. But while we look for these other qualities to follow, we recognize the fact that upon technical excellence all good art must be grounded. And as technical excellence was the one thing most disregarded in American work until very recent years, we are far from regretting the reverence with which Frans Hals has been studied, the fervor with which his teaching has been applied to practice. Yet we must lament a little that his highest efforts have not always been the ones consulted,—that his short-hand execution and his almost monochromatic brown tone have oftener served as text-books than the canvases where he shows himself a master of gray or golden tone and of lovely color; of perfect freedom, yet of perfect balance; of the utmost swiftness, yet the most accurate, complete, and expressive definition.

M. G. van Rensselaer.

FLOOD AND PLAGUE IN NEW ORLEANS.

BY GEORGE W. CABLE,

Author of "Old Creole Days," "The Grandissimes," etc.

I.

INUNDATIONS.

THE people of New Orleans take pride in Canal street. It is to the modern town what the Place d'Armes was to the old. Here stretch out in long parade, in variety of height and color, the great retail stores, displaying their silken and fine linen and golden seductions; and the fair Creole and American girls, and the self-depreciating American mothers, and the majestic Creole matrons, all black lace and alabaster, swarm and hum and push in and out and flit here and there among the rich things and fine things, the novelties and the bargains. Its eighteen-feet sidewalks are roofed from edge to edge by verandas that on gala-days are stayed up with extra scantlings and yet seem ready to come splintering down under the crowd of parasoled ladies sloping upward on them from front to back in the fashion of the amphitheater. Its two distinct, granite-paved roadways are each forty feet wide, and the tree-bordered "neutral ground" between measures fifty-four feet across. It was "neutral" when it divided between the French quarter and the American at the time when their "municipality" governments were distinct from each other.

In Canal street, well-nigh all the street-car lines in town begin and end. The Grand Opera House is here; also, the Art Union. The club-houses glitter here. If Jackson Square has one bronze statue, Canal street has the only other. At the base of Henry Clay's pedestal, the people rally to hear the demagogues in days of political fever, and the tooth-paste orator in nights of financial hypertrophy. Here are the grand reviews. Here the resplendent Mystic Krewe marches by calcium lights on carnival nights up one roadway and down the other, and

> "Perfume and flowers fall in showers,
> That lightly rain from ladies' hands."

Here is the huge granite custom-house, that "never is but always to be" finished. Here is a row of stores monumental to the sweet memory of the benevolent old Portuguese Jew whom Newport, Rhode Island, as well as New Orleans, gratefully honors—Judah Touro. Here sit the flower *marchandes*, making bouquets of jasmines and roses, clove-pinks, violets, and lady-slippers. Here the Creole boys drink mead, and on the verandas above maidens and their valentines sip sherbets in the starlight. Here only, in New Orleans, the American "bar" puts on a partial disguise. Here is the way to West End and to Spanish Fort, little lakeside spots of a diminished Coney Island sort. The gay carriage-parties turn north-westward, scurrying away to the races. Yea, here the funeral train breaks into a trot toward the cemeteries of Metairie Ridge. Here is Christ's Church, with its canopied weddings. Here the ring-politician mounts perpetual guard. Here the gambler seeks whom he may induce to walk around into his parlor in the Rue Royale or St. Charles street. And here, in short, throng the members of the great New Orleans Creole-American house of Walker, Doolittle and Co.

One does not need to be the oldest resident to remember when this neutral ground in Canal street was still a place of tethered horses, roaming goats, and fluttering lines of drying shirts and petticoats. In those days an old mule used to drag his dejected way slowly round and round in an unchanging circle on the shabby grassed avenue, just behind the spot where the statue of Henry Clay was later erected by good Whigs in 1856. An aged and tattered negro was the mule's ringmaster, and an artesian well was the object of his revolution.

No effort deeply to probe the city's site had ever before been made, nor has there been any later attempt thus to draw up the prehistoric records of the Delta. The alluvial surface deposit is generally two or three feet thick, and rests on a substratum of uniform and tenacious blue clay. The well in Canal street found this clay fifteen feet deep. Below it lay four feet more of the same clay mixed with woody matter. Under this was a mixture of sand and clay ten feet thick, resembling the annual deposits of the river. Beneath this was found, one after another, continual, irregular alternations of these clay

strata, sometimes a foot, sometimes sixty feet thick, and layers of sand and shells and of mixtures of these with clay. Sometimes a stratum of quicksand was passed. At five hundred and eighty-two feet was encountered a layer of hard pan; but throughout no masses of rock were found, only a few water-worn pebbles and some contorted and perforated stones. No abundance of water flowed. Still, in the shabby, goat-haunted neutral ground above, gaped at by the neutral crowd, in the wide, blinding heat of midsummer, the long lever continued to creak round its tremulous circle. At length it stopped. At a depth of six hundred and thirty feet the well was abandoned—for vague reasons left to the custody of tradition; some say the mule died, some say the negro.

However, the work done was not without value. It must have emphasized the sanitary necessity for an elaborate artificial drainage of the city's site, and it served to contradict a very prevalent and solicitous outside belief that New Orleans was built on a thin crust of mud, which she might at any moment break through, when towers, spires, and all would ingloriously disappear. The continual alternations of tough clay and loose sand and shells in such variable thicknesses gave a clear illustration of the conditions of delta soil that favor the undermining of the Mississippi banks and their fall into the river at low stages of water, levees being often carried with them.

These cavings are not generally *crevasses*. A crevasse is commonly the result of the levee yielding to the pressure of the river's waters, heaped up against it often to the height of ten or fifteen feet above the level of the land. But the caving-in of old levees requires their replacement by new and higher ones on the lower land farther back, and a crevasse often occurs through the weakness of a new levee which is not yet solidified, or whose covering of tough Bermuda turf has not yet grown. The fact is widely familiar, too, that when a craw-fish has burrowed in a levee, the water of the river may squirt in and out of this little tunnel, till a section of the levee becomes saturated and softened, and sometimes slides shoreward bodily from its base, and lets in the flood,— roaring, leaping, and tumbling over the rich plantations and down into the swamp behind them, leveling, tearing up, drowning, destroying, and sweeping away as it goes.

New Orleans may be inundated either by a crevasse or by the rise of backwater on its northern side from lake Pontchartrain. Bayou St. John is but a prehistoric crevasse minus only the artificial levee. A long-prevailing south-east wind will obstruct the outflow of the lake's waters through the narrow passes by which they commonly reach the gulf of Mexico, and the rivers and old crevasses emptying into the lake from the north and east will be virtually poured into the streets of New Orleans. A violent storm blowing across Pontchartrain from the north produces the same result. At certain seasons, the shores of river, lake, and canals have to be patrolled day and night to guard the wide, shallow basin in which the city lies from the insidious encroachments of the waters that overhang it on every side.

It is difficult, in a faithful description, to avoid giving an exaggerated idea of these floods. Certainly, large portions of the city are inundated; miles of streets become canals. The waters rise into yards and gardens and then into rooms. Skiffs enter the poor man's parlor and bedroom to bring the morning's milk or to carry away to higher ground his goods and chattels. All manner of loose stuff floats about the streets; the house-cat sits on the gate-post; huge rats come swimming, in mute and loathsome despair, from that house to this one, and are pelted to death from the windows. Even snakes seek the same asylum. Those who have the choice avoid such districts, and the city has consequently lengthened out awkwardly along the higher grounds down, and especially up, the river shore.

But the town is not ingulfed; life is not endangered; trade goes on in its main districts mostly dry-shod, and the merchant goes and comes between his home and his counting-room as usual in the tinkling street-cars, merely catching glimpses of the water down the cross streets.

The humbler classes, on the other hand, suffer severely. Their gardens and poultry are destroyed, their houses and household goods are damaged; their working days are discounted. The rich and the authorities, having defaulted in the ounce of preventive, come forward with their ineffectual pound of cure; relief committees are formed and skiffs ply back and forth distributing bread to the thus doubly humbled and doubly damaged poor.

No considerable increase of sickness seems to follow these overflows. They cannot more completely drench so ill-drained a soil than would any long term of rainy weather; but it hardly need be said that neither condition is healthful under a southern sky.

In the beginning of the town's existence, the floods came almost yearly, and for a long time afterward they were frequent. The old moat and palisaded embankment around the Spanish town did not always keep them out.

There was a disastrous one in 1780, when the Creoles were strained to the utmost to bear the burdens of their daring young Governor Galvez's campaigns against the British. Another occurred in 1785, when Mirò was governor; another in 1791, the last year of his incumbency; another in 1799. All these came from river crevasses above the town. The last occurred near where Carrollton, now part of New Orleans, was afterward built. Another overflow, in 1813, came from a crevasse only a mile or two above this one.

Next followed the noted overflow of May, 1816. The same levee that had broken in 1799 was undermined by the current, which still strikes the bank at Carrollton with immense power; it gave way and the floods of the Mississippi poured through the break. On the fourth day afterward, the waters had made their way across sugar-fields and through swamps and into the rear of the little city, had covered the suburbs of Gravier, Trémé, and St. Jean with from three to five feet of their turbid, yellow flood, and were crawling up toward the front of the river-side suburbs—Montegut, La Course, Ste. Marie, and Marigny. In those days, the corner of Canal and Chartres streets was only some three hundred yards from the river shore. The flood came up to it. One could take a skiff at that point and row to Dauphine street, down Dauphine to Bienville, down Bienville to Burgundy, in Burgundy to St. Louis street, from St. Louis to Rampart, and so throughout the rear suburbs, now the Quadroon quarter.

The breach was stopped by sinking in it a three-masted vessel. The waters found vent through Bayous St. John and Bienveau to the lake; but it was twenty-five days before they were quite gone. This twelvemonth was the healthiest in a period of forty years.

In 1831, a storm blew the waters of Lake Pontchartrain up to within six hundred yards of the levee. The same thing occurred in October, 1837, when bankruptcy as well as back waters swamped the town. The same waters were driven almost as far in 1844 and again in 1846.

It would seem as if town pride alone would have seized a spade and thrown up a serviceable levee around the city. But town pride in New Orleans was only born about 1836, and was a puny child. Not one American in five looked on the place as his permanent home. As for those who did, the life they had received from their fathers had become modified. Some of them were a native generation. Creole contact had been felt. The same influences, too, of climate, landscape, and institutions, that had made the Creole unique was de-Saxonizing the American of the "Second Municipality," and giving special force to those two traits which everywhere characterized the slave-holder—improvidence, and that feudal self-completeness which looked with indolent contempt upon public coöperative measures.

The Creole's answer to suggestive inquiry concerning the prevention of overflows, it may easily be guessed, was a short, warm question: "How?" He thought one ought to tell him. He has ten good "cannots" to one small "can"—or once had; the proportion is better now, and so is the drainage; and still, heat, moisture, malaria, and provincial exile make a Creole of whoever settles down beside him.

In 1836, a municipal draining company was formed, and one draining wheel erected at Bayou St. John. In 1838, a natural drain behind the American quarter was broadened and deepened into the foul ditch known as Melpomene canal. And, in 1849, came the worst inundation the city has ever suffered.

II.

SAUVÉ'S CREVASSE.

On the 3d of May, 1849, the Mississippi was higher than it had been before in twenty-one years. Every here and there it was licking the levee's crown, swinging heavily around the upper end of its great bends, gliding in wide, enormous volume down upon the opposite bank below, heaving its vast weight and force against the earthen barrier, fretting, quaking, recoiling, boiling like a pot, and turning again and billowing away like a monstrous yellow serpent, crested with its long black line of drift-wood, to throw itself once more against the farther bank in its mad, blind search for outlet.

Everywhere, in such times, the anxious Creole planter may be seen, broad-hatted and swarthy, standing on his levee's top. All night the uneasy lantern of the patrol flits along the same line. Rills of seepage water wet the road—which in Louisiana always runs along against the levee's inner side—and here and there make miry places. "Cribs" are being built around weak spots. Sand-bags are held in readiness. The huge, ungainly cane-carts, with their high, broad-tired wheels and flaring blue bodies, each drawn by three sunburned mules abreast, come lumbering from the sugar-house yard with loads of *bagasse*, with which to give a fibrous hold to the hasty earth-works called for by the hour's emergency. Here at the most dangerous spot the muscular strength of the estate is grouped;

a saddled horse stands hitched to the roadside fence; the overseer is giving his short, emphatic orders in the negro French of the plantations, and the black man, glancing ever and anon upon him with his large brown eye, comes here and goes there, *li vini 'ci, li courri là.* Will they be able to make the levee stand? Nobody knows.

In 1849, some seventeen miles above New Orleans by the river's course, and on the same side of the stream, was Sauvé's plantation. From some cause, known or unknown, —sometimes the fact is not even suspected,— the levee along its river-front was weak. In the afternoon of the 3d of May, the great river suddenly burst through it, and, instantly defying all restraints, plunged down over the land, roaring, rolling, writhing, sprawling, whirling over pastures and cane-fields and rice-fields, through groves and negro quarters and sugar-houses, slipping through rose-hedged lanes and miles of fence, gliding through willow jungles and cypress forests, on and on, to smite in rear and flank the city that, seventeen miles away, lay peering alertly over its front breastworks. The people of the town were not, at first, concerned. They believed and assured each other the water would find its way across into Lake Pontchartrain without coming down upon them. The Americans exceeded the Creoles in absolute torpor. They threw up no line behind their municipality. Every day that passed saw the swamp filling more and more with yellow water; presently it crawled up into the suburbs, and when the twelfth day had gone by, Rampart street, the old town's rear boundary, was covered.

The Creoles, in their quarter, had strengthened the small levee of canal Carondelet on its lower side and shut off the advancing flood from the district beyond it; but Lafayette and the older American quarter were completely exposed. The water crept on daily for a fortnight longer. In the suburb Bouligny, afterward part of Jefferson or the Sixth District, it reached to Camp street. In Lafayette, it stopped within thirty yards of where these words are being written, and withdrawing toward the forest, ran along behind Bacchus (Baronne) street, sometimes touching Carondelet, till it reached Canal street, crossed that street between Royale and Bourbon, and thence stretched downward and backward to the Old Basin. "About two hundred and twenty inhabited squares were flooded, more than two thousand tenements surrounded by water, and a population of nearly twelve thousand souls driven from their homes or compelled to live an aquatic life of much privation and suffering."

In the meantime, hundreds of men, white and black, were constantly at the breach in the levee, trying to close it. Pickets, sandbags, *bagasse*, were all in vain. Seven hundred feet of piling were driven, but unskillfully placed; a ship's hull was filled with stone and sunk in the half-closed opening, but the torrent burrowed around it and swept away the works. Other unskilled efforts failed, and only on the third of June was professional scientific aid called in, and seventeen days afterward the crevasse was closed.

At length, the long submerged streets and sidewalks rose slimily out of the retreating waters, heavy rains fell opportunely and washed into the swamp the offensive deposits that had threatened a second distress, and the people set about repairing their disasters. The streets were in sad dilapidation. The Second Municipality alone levied, in the following year, four hundred thousand dollars to cover "actual expenditures on streets, wharves, and crevasses." The wharves were, most likely, in the main, new work. A levee was thrown up behind the municipality along the line of Claiborne street and up Felicity road to Carondelet street.

Still overflows came, and came, and overcame. A serious one occurred only two years ago.* At such times, the fortunate are nobly generous to the unfortunate; but the distress passes, the emotional impulses pass with it, and precautions for the future are omitted or soon fall into neglect. The inundation of 1880 simply overran the dilapidated top of a neglected levee on the town's lake side. The uneconomical habits of the old South still cling. Private burdens are but faintly recognized, and the next norther may swamp the little fortunes of the city's hard-working poor.

The hopeful in New Orleans look for an early day when a proper drainage system shall change all this,—a system which shall include underground sewerage and complete the levee, already partly made, which is to repeat on a greatly enlarged scale, above and below the city and along the lake shore behind it, the old wall and moat that once surrounded the Spanish town in Canal, Rampart, and Esplanade streets. The present system consists merely of a poor and partial surface drainage in open street-gutters, emptying into canals at whose further end the waters are lifted over the rear levees by an appliance of old Dutch paddle-wheel pumps run by steam. Even the sudden heavy showers that come with their singeing lightnings and ear-cracking peals of thunder, are enough, at present, to overflow the streets of the whole town,

* 1880.

often from sill to sill of opposite houses and stores, holding the life of a great city water-bound for hours, making strange arch-way and door-way groups of beggar and lady, clerk, fop, merchant, artisan, fruit-peddler, negro porter, priest, tattered girl, and every other sort of fine or pitiful human nature.

An adequate system, comprising a thorough under-drainage, would virtually raise the city's whole plain ten feet, and give a character of soil under foot incalculably valuable for the improvement it would effect in the health and energies of the people. Such a system is entirely feasible, is within the people's means, has been tested elsewhere, extensively and officially approved, and requires only the subscription of capital.

But we go astray. We have got out upon the hither side of those volcanoes of civil war and reconstruction which it were wiser to stop short of. Let us draw back once more for a last view of the "Crescent City's" earlier and calmer, though once tumultuous and all too tragic past.

III.

THE DAYS OF PESTILENCE.

THE New Orleans resident congratulates himself—and he does well—that he is not as other men are, in other great cities, as to breathing-room. The desperate fondness with which the Creole still clings to domestic isolation has passed into the sentiment of all types of the city's life; and as the way is always open for the town, with just a little river-sand filling, to spread farther and farther, there is no huddling in New Orleans, or only a very little here and there.

There is assurance of plenty not only as to space, but also as to time. Time may be money, but money is not everything, and so there never has been much crowding over one another's heads about business centers, never any living in sky-reaching strata. The lassitude which loads every warm, damp breeze that blows in across the all-surrounding marsh and swamp has always been against what an old New Orleans writer calls "knee-cracking stairways." Few houses lift their roofs to dizzy heights, and a third-story bedroom is not near enough to be coveted by many.

Shortly before the war—and the case is not materially changed in New Orleans to-day—the number of inmates to a dwelling was in the proportion of six and a half to one. In St. Louis, it was seven and three-quarters; in Cincinnati, it was more than eight; in Boston, nearly nine; and in New York, over thirteen and a half. The number of persons to the acre was a little more than forty-five. In Philadelphia, it was eighty; in Boston, it was eighty-two; in New York, it was one hundred and thirty-five.

The climate never would permit such swarming in New Orleans. Neither would the badly scavenged streets or the soil which, just beneath, reeks with all the foul liquids that human and brute life can produce in an unsewered city. It is fortunate that the average New Orleans dwelling is loosely thrown together, built against sun and rain, not wind and frost. This, with the ample spacings between houses and an open plain all round, insures circulation of air—an air that never blows extremes of hot or cold.

Once only the thermometer has been known to sink to sixteen degrees Fahrenheit. Only three times since 1819 has it risen to one hundred degrees, and never beyond. Whatever wind prevails comes tempered by the waters and wet lands over which it has blown. Its humidity, however, is against strong vitality, its diminished evaporating powers make it less cooling to man and beast in summer and more chilling in winter than drier winds at greater and lower temperatures would be, and it comes always more or less charged with that uncanny quality which Creoles, like all other North Americans, maintain to be never at home, but always next door—malaria.

The city does not tremble with ague; but malarial fevers stand high in the annual tables of mortality, almost all complaints are complicated by more or less malarial influence, and the reduction of vital force in the daily life of the whole population is such as few residents, except physicians, appreciate. Lately, however,—we linger in the present but a moment,—attention has turned to the fact that the old Creole life, on ground floors, in a damp, warm climate, over an undrained clay soil, has given more victims to malarial and tubercular diseases than yellow fever has claimed, and efforts to remove these conditions or offset their ill effects are giving a yearly improving public health.

What figures it would require truthfully to indicate the early insalubrity of New Orleans it would be hard to guess. Governor Perier, in 1726, and the Baron Carondelet, toward the close of the last century, stand alone as advocates for measures to reduce malarial and putrid fevers. As times wore on, partial surface drainage, some paving, some improvement in house-building, wiser domestic life, the gradual retreat of the dank forest and undergrowth, a better circulation of air, and some reduction of humidity, had their good effects. Drainage canals—narrow,

shallow, foul, ill-placed things—began to be added one by one. When a system of municipal cleansing came in, it was made as vicious as ingenuity could contrive it; or, let us say, as bad as in other American cities of the time.

Neither the Creole nor the American ever accept sepulture in the ground of Orleans Parish. Only the Hebrew, whose religious law will not take no for an answer, and the pauper, lie down in its undrained soil. The tombs stand above ground. They are now made of brick or stone only; but in earlier days wood entered into their construction, and they often fell into decay so early as to expose the bones of the dead. Every day the ground, which the dead shunned, became more and more poisonous, and the city spread out its homes of the living more and more over the poisoned ground. In 1830, the population of New Orleans was something over forty-six thousand; her life was busy, her commerce great, her precautions against nature's penalties for human herding about equal to nothing. She was fully ripe for the visitation that was in store.

In that year the Asiatic cholera passed around the shores of the Caspian Sea, entered European Russia, and moved slowly westward, preceded by terror and followed by mourning. In October, 1831, it was in England. In January, 1832, it swept through London. It passed into Scotland, into Ireland, France, Spain, Italy. It crossed the Atlantic and ravaged the cities of its western shore; and, on the 25th of October, it reached New Orleans.

An epidemic of yellow fever had been raging, and had not yet disappeared. Many of the people had fled from it. The population was reduced to about thirty-five thousand. How many victims the new pestilence carried off can never be known; but six thousand fell in twenty days. On some days five hundred persons died. For once, the rallying ground of the people was not the Place d'Armes. The cemeteries were too small. Trenches took the place of graves; the dead were hauled to them uncoffined in cart-loads and dumped in. Large numbers were carried by night to the river-side, weighted with stones from the ballast-piles abreast the idle shipping, and thrown into the Mississippi. The same mortality in New Orleans with its present population, would carry off, in three weeks, thirty-nine thousand victims. The New Basin was being dug by hand. Hundreds of Irish were standing here in water and mud and sun, throwing up the corrupted soil with their shovels, and the havoc among them, says tradition, was awful.

The history of the town shows that years of much summer digging have always been years of great mortality. In 1811, when Carondelet's old canal was cleaned out, seven per cent. of the people died. In 1817, when it was cleaned out again, seven per cent. again died. In 1822, when its cleaning out was again begun, eight and a half per cent. died. In 1833, when, the year after the great cholera fatality, the New Canal was dug to the lake, eight and a half per cent. again died. In 1837, when many draining trenches were dug, seven per cent. died. In 1847, there was much new ditching, Melpomene Canal was cleaned out, and over eight per cent. of the people died. The same work went on through '48 and '49, and seven and eight per cent. died. But never before or after 1832 did death recruit his pale armies by so frightful a conscription, in this plague-haunted town, as marked that year of double calamity, when, from a total population of but fifty-five thousand, present and absent, over eight thousand fell before their Asian and African destroyers.

IV.

THE GREAT EPIDEMIC.

THREE-QUARTERS of a century had passed over the little Franco-Spanish town, hidden under the Mississippi's downward-retreating bank in the edge of its delta swamp on Orleans island, before the sallow specter of yellow fever was distinctly recognized in her streets and in her darkened chambers.

That it had come and gone earlier, but unidentified, is altogether likely. In 1766 especially, the year in which Ulloa came with his handful of Havanese soldiers to take possession for Spain, there was an epidemic which at least resembled the great West Indian scourge. Under the commercial concessions that followed, the town expanded into a brisk port. Trade with the West Indies grew, and in 1796, the yellow fever was confronted and called by name.

From that date it appeared frequently if not yearly, and between that date and the present day twenty-four lighter and thirteen violent epidemics have marked its visitations. At their own horrid caprice they came and went. In 1821, a quarantine of some sort was established, and it was continued until 1825; but it did not keep out the plague, and it was then abandoned for more than thirty years. Between 1837 and 1843, fifty-five hundred deaths occurred from the fever. In the summer and fall of 1847, over twenty-eight hundred people perished by it. In the second half of 1848,

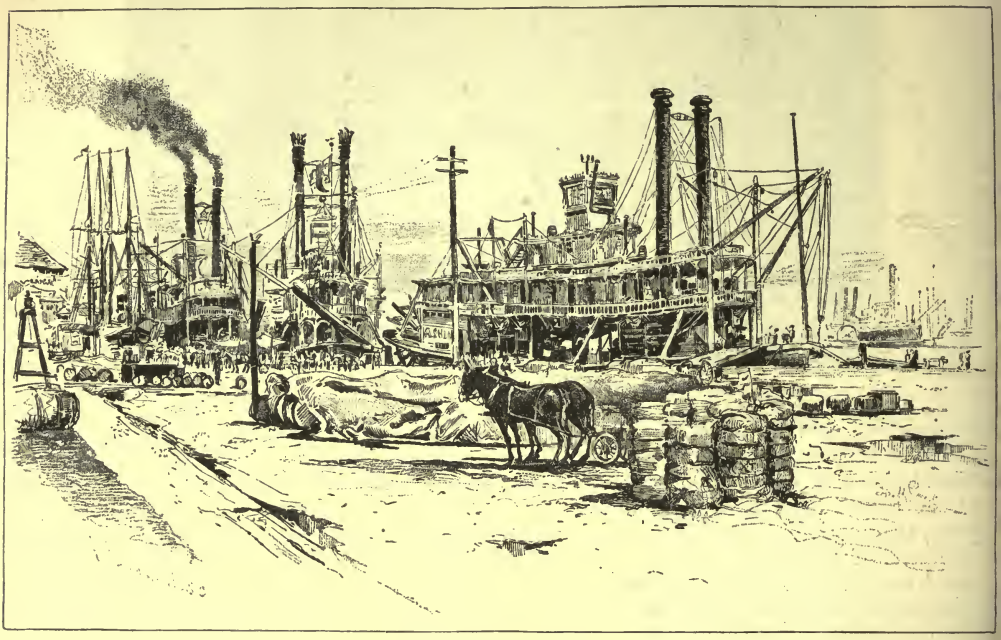
A CREVASSE. (STORY'S PLANTATION, 1882.)

eight hundred and seventy-two were its victims. It had barely disappeared when cholera entered again and carried off forty-one hundred. A month after its disappearance,—in August, 1849,—the fever returned; and when, at the end of November, it had destroyed seven hundred and forty-four persons, the cholera once more appeared; and by the end of 1850 had added eighteen hundred and fifty-one to the long rolls.

In the very midst of these visitations, it was the confident conviction and constant assertion of the average New Orleans citizen, Creole or American, on his levee, in the St. Charles rotunda, at his counting-room desk, in the columns of his newspaper, and in his family circle, that his town was one of the healthiest in the world. The fatality of the epidemics was principally among the unacclimated. He was not insensible to their sufferings, he was famous for his care of the sick; the town was dotted with orphan asylums. But in this far-away corner crucial comparisons escaped him. The Creole did not readily take the fever, and, taking it, commonly recovered. He had, and largely retains still, an absurd belief in his entire immunity from attack. When he has it, it is

A FULL RIVER. (LOWER FRONT CORNER OF THE OLD TOWN.)

something else. As for strangers,—he threw up his palms and eyebrows,—nobody asked them to come to New Orleans. The mind of the American turned only to commerce; and the commercial value of a well-authenticated meet this libel with facts." But he gave no figures. In January, 1851, the mayor officially pronounced the city "perfectly healthy during the past year," etc., omitting to say that the mortality had been three times as high as



THE "PICAYUNE TIER."

low death-rate he totally overlooked. Every summer might bring plague—granted; but winter brought trade, wealth. It thundered and tumbled through the streets like a surf. The part of a good citizen seemed to be to shut his eyes tightly and drown comment and debate with loud assertions of the town's salubrity.

It was in these days that a certain taste for books showed itself, patronized and dominated by commerce. De Bow's excellent monthly issue, the "Commercial Review of the South and West," was circulating its invaluable statistics and its pro-Southern deductions in social and political science. Judah P. Benjamin wrote about sugar; so did Valcour-Aimé; Riddell treated of Mississippi river deposits, etc.; Maunsell White gave reminiscences of flat-boat navigation; Chief-Justice Martin wrote on contract of sale; E. J. Forstall on Louisiana history in French archives; and a great many "ladies" and "gentlemen," "of New Orleans" and elsewhere, upon the absorbing topic of slavery, to while away the time, as it were. "New Orleans, disguise the fact as we may," wrote De Bow in 1846, "has had abroad the reputation of being a great charnel-house. * * * We a moderate death-rate would have been. A few medical men alone,—Barton, Symonds, Fenner, Axson,—had begun to drag from oblivion the city's vital statistics and to publish facts that should have alarmed any community. But the blind are not frightened with ghosts. Barton showed that the mortality of 1849, *over and above* the deaths by cholera, had been about twice the common average of Boston, New York, Philadelphia, or Charleston. What then? Nothing. He urged under-ground sewerage in vain. Quarantine was proposed; commerce frowned. A plan was offered for daily flushing the city's innumerable open street-gutters; it was rejected. The vice of burying in tombs above ground in the heart of town was shown; but the burials went on.

As the year 1853 drew near, a climax of evil conditions seemed to be approached. The city became more dreadfully unclean than before. The scavenging was being tried on a contract system, and the "foul and nauseous steams" from gutters, alleys, and dark nooks became intolerable. In the merchants' interest Carondelet basin and canal were being once more dug out; the New Canal was being widened; gas and water

mains were being extended; in the Fourth District, Jackson street and St. Charles avenue were being excavated for the road-beds of their railways. In the Third District, many small draining trenches were being dug. On the 12th of March, the ship *Augusta* sailed from Bremen for New Orleans with upward of two hundred emigrants. Thirteen days afterward the *Northampton* left Liverpool, bound in the same direction, with between three or four hundred Irish. She had sickness on board during the voyage, and some deaths. The *Augusta* had none. While these were on their way, the bark *Siri*, in the port of Rio de Janeiro, lost her captain and several of her crew by yellow fever, and afterward sailed for New Orleans. The ship *Camboden Castle* cleared from Kingston, Jamaica, for the same port, leaving seven of her crew dead of the fever. On the 9th of May, the *Northampton* and the *Siri* arrived in the Mississippi. The *Northampton* was towed to the city alone, and on the 10th was moored at a wharf in the Fourth District, at the head of Josephine street. The *Siri* was towed up in company with another vessel, the *Saxon*. She was dropped at a wharf in the First District. The *Saxon* moved on and rested some distance away, at a wharf opposite the water-works reservoir, in front of Market street. The *Northampton* was found to be very foul. Hands sent aboard to unload and clean her left on the next day, believing they had detected "black vomit" in her hospital. One of them fell sick of yellow fever three days after, but recovered. A second force was employed; several became ill. This was on the 17th. On the same day, the *Augusta* and the *Camboden Castle* entered the harbor in the same tow. The *Camboden Castle* was moored alongside the *Saxon*. At the next wharf, two or three hundred feet below, lay abreast the *Niagara* and the *Harvest Queen*. The *Augusta* passed on up and cast off her tow-lines only when she was moored close to the *Northampton*. The emigrants went ashore. Five thousand landed in New Orleans that year. Here, then, was every condition necessary to the outbreak of a pestilence, whether indigenous, imported, or both.

On the same day that the fever broke out on the *Northampton* it appeared also on the *Augusta*. About the same time it appeared in one or two distant parts of the city without discernible connection with the shipping. On the 29th, it appeared on the *Harvest Queen*, and, five days later, on the *Saxon*. The *Niagara* had put to sea; but, on the 8th, the fever broke out on her and carried off the captain and a number of the crew. Two fatal cases in the town the attending physician reported under a disguised term, "not wishing to create alarm." Such was the inside, hidden history of the Great Epidemic's beginning.

A CEMETERY WALK. (TOMBS AND "OVENS.")

On the 27th of May, one of the emigrants from the *Northampton* was brought to the charity hospital. He had been four days ill, and he died the next day, of yellow fever. The Board of Health made official report of the case; but the daily papers omitted to publish it. Other reports followed in June; they were shunned in the same way, and the great city, with its one hundred and fifty-four thousand people, one in every ten of whom was to die that year, remained in slumberous ignorance of the truth. It was one of the fashions. On the 2d of July, twenty-five deaths from yellow fever were reported for the closing week. Many "fever centers" had been developed. Three or four of them pointed, for their origin, straight back to the *Northampton;* one to the *Augusta*, and one to the *Saxon*.

A season of frequent heavy rains, alternating with hot suns and calms—the worst of conditions—set in. At the end of the next week, fifty-nine deaths were reported. There had been not less, certainly, than three hundred cases, and the newspapers slowly and one by one began to admit the presence of danger. But the truth was already guessed, and alarm and dismay lurked everywhere. Not in every breast, however; there were still those who looked around with rather impatient surprise, and—often in Creole accent,

THE OLD BURIAL CHURCH.

and often not—begged to be told what was the matter. The deaths around them, they insisted, in print, were at that moment "fewer in number than in any other city of similar population in the Union."

Indeed, the fever was still prowling distantly in those regions most shunned by decent feet and clean robes; about Rousseau street, and the like, along the Fourth District river-front, where the forlorner German immigrants boarded in damp and miry squalor; in the places where such little crowded living as there was in the town was gathered; Lynch's row and other blocks and courts in the filthy Irish quarters of St. Thomas and Tchoupitoulas streets; and the foul, dark dens about the French market and the Mint, in the old French quarter; among the Gascon *vacheries* and *boucheries*, of repulsive uncleanness, on the upper and rear borders of the Fourth District; and around Gormley's basin—a small artificial harbor at the intersection of Dryades walk and Felicity road, for the wood-cutters and shingle-makers of the swamp, and "a pestilential muck-and-mire pool of dead animals and filth of every kind."

But suddenly the contagion leaped into the midst of the people. In the single week ending July 16th, two hundred and four persons were carried to the cemeteries. A panic seized the town. Everywhere porters were tossing trunks into wagons, carriages rattling over the stones and whirling out across the broad white levee to the steam-boats' sides. Foot-passengers were hurrying along the sidewalk, luggage and children in hand, and out of breath, many a one with the plague already in his pulse. The fleeing crowd was numbered by thousands.

During the following week, the charity hospital alone received from sixty to one hundred patients a day. Its floors were covered with the sick. From the 16th to the 23d, the deaths averaged sixty-one a day. Presently, the average ran up to seventy-nine. The rains continued, with much lightning and thunder. The weather became tropical; the sun was scorching hot and the shade chilly. The streets became heavy with mud, the air stifling with bad odors, and the whole town a perfect Constantinople for foulness.

August came on. The week ending the 6th showed one hundred and eighty-seven deaths from *other* diseases, an enormous death-rate, to which the fever added nine hundred and forty-seven victims. For a week, the deaths in the charity hospital—where the poor immigrants lay—had been one every half hour.

The next day two hundred and twenty-eight persons died. The pestilence had attacked the Creoles and the blacks. In every direction were confusion, fright, flight, calls for aid, the good "Howards" hurrying from door to door, widows and orphans weeping, till the city was, as an eye-witness says, a "theater of horrors."

"Alas," cries one of the city journals, "we have not even grave-diggers!" Five dollars an hour failed to hire enough of them. Some of the dead went to the tomb still, with pomp and martial honors; but the city scavengers, too, with their carts, went knocking from house to house asking if there were any to be buried. Long rows of coffins were laid in furrows scarce two feet deep, and hurriedly covered with a few shovelfuls of earth, which the daily rains washed away, and the whole mass was left, "filling the air far and near

with the most intolerable pestilential odors." Around the grave-yards funeral trains jostled each other and quarreled for place, in an air reeking with the effluvia of the earlier dead. Many "fell to work and buried their own dead." Many sick died in carriages and carts. Many were found dead in their beds, in stores, in the streets. Vice and crime broke out fiercely; the police were never so busy. Heroism, too, was seen on every hand. Hundreds toiled for the comfort of sick and dying, and hundreds fell victims to their own noble self-abnegation. Forty-five distant cities and towns sent relief.

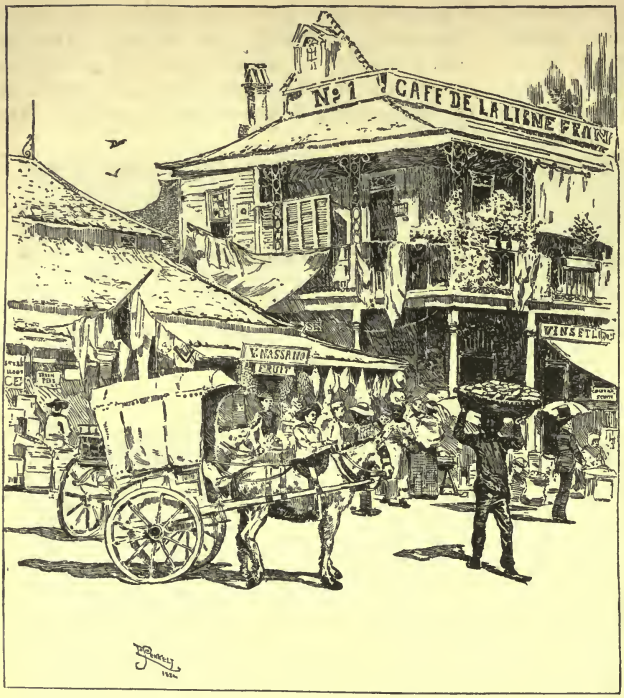
AMONG THE MARKETS.

On one day, the 11th of August, two hundred and three persons died of the fever. In the week ending two days later, the total deaths were fourteen hundred and ninety-four. Rain fell every day for two months. Streets became so bad that hearses could scarcely reach the cemeteries. On the 20th, the week's mortality was fifteen hundred and thirty-four.

Despair now seemed the only reasonable frame of mind. In the sky above, every new day brought the same merciless conditions of atmosphere. The earth below bubbled with poisonous gases. Those who would still have fled the scene saw no escape. To leave by ship was to court the overtaking stroke of the plague beyond the reach of medical aid, and probably to find a grave in the sea; while to escape to inland towns was to throw one's self into the arms of the pestilence, carried there by earlier fugitives. The numbers of the dead give but an imperfect idea of the wide-spread suffering and anguish. The disease is repulsive and treacherous, and requires the most unremitting and laborious attention. Its fatal ending is inexpressibly terrible, often attended with raving madness. Among the Creoles of the old French quarter, a smaller proportion than one in each eleven suffered attack. But in the Fourth District, where the unacclimated were most numerous, there were whole wards where more than half the population had to take their chances of life and death from the dreadful contagion. In the little town of Algiers, just opposite the city, a thirty-sixth of all its people died in one week.

On the 22d day of August, the climax was at last reached. Death struck that day, from midnight to midnight, a fresh victim every five minutes, and two hundred and eighty-three deaths summed up an official record that was confessedly incomplete. The next day, there were twenty-five less. The next, thirty-six less than this. Each day was better than the preceding. The crisis had passed. Hope rose into rejoicing. The 1st of September showed but one hundred and nineteen deaths, and the 10th but eighty. North winds and cool, dry weather set in. On the 20th, there were but forty-nine deaths; on the 30th, only sixteen. In some of the inland towns it was still raging, and so continued until the middle of October.

In the cemeteries of New Orleans, between the 1st of June and the 1st of October, nearly



BEHIND THE FRENCH MARKET.

eleven thousand persons were buried. To these must be added the many buried without certificate, the hundreds who perished in their flight, and the multitudes who fell in the towns to which the pestilence was carried. It lingered through autumn, and disappeared only in December. During the year 1853 nearly thirty thousand residents of New Orleans were ill of the yellow fever, and there died, from all causes, nearly sixteen thousand.

In the next two summers, 1854 and '55, the fever returned and destroyed more than five thousand persons. Cholera added seventeen hundred and fifty. The two years' death-rates were seventy-two and seventy-three per thousand. That of 1853 was one hundred and eleven. In three years, thirty-seven thousand people had died, and wherever, by ordinary rate of mortality, there should have been one grave or sepulchre, there were four. One can but draw a sigh of relief in the assurance that this is a history of the past, not the present, and that new conditions have made it next to impossible that it should ever be repeated in the future.

V.

BRIGHTER SKIES.

"Out of this nettle, danger," says the great bard, "we pluck this flower, safety." The dreadful scourge of 1853 roused the people of New Orleans, for the first time, to the necessity of knowing the proven truth concerning themselves and the city in which they dwelt.

In the midst of the epidemic, the city council had adjourned, and a number of its members had fled. But, in response to popular demand, a board of health had appointed the foremost advocates of quarantine and municipal cleansing a commission to study and report the melancholy lessons of the plague. It labored arduously for many months. At its head was that mayor of New Orleans, Crossman by name, whose fame for wise and protracted rule is still a pleasant tradition of the city, and whose characteristic phrase — "a great deal to be said on both sides" — remains the most frequent quotation on the lips of the common people to-day. Doctors Barton, Axson, McNeil, Symonds, and Riddell, — men at the head of the medical profession, — completed the body. They were bold and faithful, and they effected a revolution.

The thinking and unbiased few, who in all communities must first receive and fructify the germ of truth, were convinced. The technical question of the fever's contagiousness remained unsettled; but its transportability was fearfully proven in a multitude of interior towns, and its alacrity in seeking foul quarters and its malignancy there were plainly shown by its history in the city. The commission pronounced in favor of quarantine, and it was permanently established, and has ever since become, annually, more and more effective. They earnestly recommended, also, the purging of the city, and keeping it purged, by proper drainage and sewerage, of all those foul conditions that were daily poisoning its earth and air. The response to this was extremely feeble.

It would seem as if the commercial value both of quarantine and cleanliness might have been seen by the merchant, since the aggregate value of exports, imports, and domestic receipts fell off twenty-two and a half millions, and did not entirely recover for three years. But it was not. The merchants, both Creole and American, saw only the momentary inconveniences and losses of quarantine and its defective beginnings; the daily press, in bondage to the merchant

through its advertising columns, carped and caviled in two languages at the innovation and expanded on the filthiness of other cities, while the general public thought what they read.

Yet, in the face of all set-backs, the city that once was almost annually scourged, has, in the twenty-seven years since the great epidemic, which virtually lasted till 1855, suffered but one mild and three severe epidemics. In 1878, occurred the last of these, and the only severe one in fourteen years. Its fatality was but little over half as great as that of the Great Epidemic. In the five years ending with 1855, the average annual mortality had been seventy. In the next five, it fell to forty-five. In the five of the war period, it was forty. In the next, it was thirty-nine; in the next, it sank to thirty-four and a half, and in that which closed in 1880, notwithstanding the terrible epidemic of 1878, the rate was but thirty-three and a half. The mortality of 1879 was under twenty-four, and that of 1880, under twenty-five per thousand.

The events of 1878 are fresh in the public mind. In New Orleans they overwhelmed the people at large with the convictions which 1853 had impressed upon the more thoughtful few. To the merchant, "shot-gun quarantines" throughout the southern Mississippi valley explained themselves. The commercial necessity of quarantine and sanitation was established without a single scientific light, and measures were taken in hand for perfecting both — measures which are growing and bearing fruit day by day, which have already reduced the insalubrity of New Orleans to a point where it may be compared with that of other great cities, and which promise before long to make the city, really and emphatically, the home of health, comfort, and safety.

In the study of his expanded city, we have wandered from the contemplation of the Creole himself. It remains to be said that, unquestionably, as his town has expanded and improved, so has he. As the improvements of the age draw the great world nearer and nearer to him, he becomes more and more open to cosmopolitan feeling. The hostility to Americans, as such, is little felt. The French tongue is falling into comparative disuse, even in the family circle. The local boundaries are overstepped. He lives above Canal street now without feeling exiled. The social circles blend into each other. Sometimes, with the old Gallic intrepidity of conviction, he moves ahead of the American in progressive thought.

In these matters of sanitary reform, he has his share — or part of it. The old feeling of castellated immunity in his own high-fenced home often resents, in sentiment at least, official house-to-house inspection and the disturbance of a state of affairs under which his father and grandfather reached a good old age and left no end of children. Yet the movement in general has his assent; sometimes his coöperation; sometimes his subscription; and his doctors take part in debates and experiments. He is in favor of all this healthful flushing; this deepening and curbing of canals; this gratuitous and universal distribution of copperas, etc. Against one feature only he wages open war. He laughs; but he is in earnest: copperas, he tolerates; lime, the same; all odorless disinfectants, indeed; but carbolic acid — no! In Gallic fierceness, he hurls a nickname at it — "*acide diabolique*." When he smells it, he loads his gun and points it through his shutters. You shall never sprinkle him with that stuff — never!

A NOCTURNE OF RUBINSTEIN.

I.

WHAT now remains, what now remains but night?
Night hopeless, since the moon is in her grave!

Late came a glorious light,
In one wide flood on spire and field and wave.
It found a flowing way
To secret places where the dead leaves lay;
It won the half-hid stream
To shy remembrance of her morning gleam;
Then on the sky's sharp shore
Rolled back, a fading tide, and was no more.
No more on spire and ivied window bright!
No more on field and wave!

What now remains, what now remains but night?
Night hopeless, since the moon is in her grave!

II.

Dumb waits the dim, broad land,
Like one who hears, yet cannot understand,
Tidings of grief to come.
The woods and waters, with the winds, are dumb.
But now a breeze has found
Sorrowful voice, and sobs along the ground:
"Oh the lost light, the last, the best lost light!
No more on field and wave!"

What now remains, what now remains but night?
Night hopeless, since the moon is in her grave!

III.

Hark, how the wind outswells,
Tempting the wood's dark heart till he rebels,
And, shaking his black hair,
Lifts up a cry of passion and despair!
The groaning branches chafe
Till scarce the small, hushed singing-birds are safe,
Tossed rocking in the nest,
Like gentle memories in a stormy breast.
A shudder, as good angels passed in flight,
Thrills over field and wave!

What now remains, what now remains but night?
Night lawless, while the moon is in her grave!

IV.

There falls a mighty hush:
And forth from far recesses fern-scents rush,
Faint as a waft from years
Long past; they touch in heaven the springs of tears.
In great drops, slow and warm,
Breaks all at once the spirit of the storm.

What now remains, what now remains but night?
Night grieving, while the moon is in her grave!

V.

Behold! the rain is over: on the wave
A new, a flashing light!
Lo, she arises calm,
The pale, the patient moon, and pours like balm
Through the wet wood's wrecked aisle
Her own unutterably tender smile!

There is no calm like that when storm is done;
There is no pleasure keen as pain's release;
There is no joy that lies so deep as peace,
No peace so deep as that by struggle won.

Naught now remains, naught now remains but night——
Night peaceful, with the moon on field and wave!

Helen Gray Cone.

[Begun in the February Number.]

A WOMAN'S REASON.*

BY W. D. HOWELLS,

Author of "Venetian Life," "A Chance Acquaintance," "A Modern Instance," etc.

XII.

It has been intimated that Helen entered upon her new life at Mrs. Hewitt's with social preoccupations in her own favor, which she was by no means prepared to surrender; and she did not think of yielding them, even in the abjectest moments of her failure and humiliation. In the interval of idleness that followed, she was again purely and simply a young lady, not attached by any sort of sympathy to the little boarding-house world, though she had always meant to treat it with consideration. But it is simply impossible that one who has been bred to be of no use should not feel an advantage over all those who have been bred to be of some use; and, if for no other reason, Helen must have confessed, wittingly and unwittingly, by a thousand little recoils and reserves, that her fellow-boarders and herself could never meet on a level. It was perfectly easy, however, to keep aloof. After the first necessary civilities with the Evanses, she only met them on the stairs or at the table, where the talk was mainly between Mr. Evans and Miss Root, the art-student. It appeared from the casual confidences of the landlady that Miss Root was studying to be a painter, and that some of her work was beautiful. Mrs. Hewitt owned that she was no judge of painting, but she said that she knew what she liked. She told Helen also that Mr. Evans was one of the editors of "Saturday Afternoon," a paper which she praised because she said it gave you the news about everybody, and kept you posted, so that you could tell just where they were and what they were doing, all the while; she believed that Mr. Evans was not connected with this admirable part of the paper; he wrote mostly about the theaters and the new books.

Helen was amused by some of his talk at the table; but she was not at all sure about the Evanses. She could not tell exactly why; one never can tell exactly why, especially if one is a lady. Mrs. Evans seemed well enough educated and well enough dressed; she had been abroad the usual term of years; she neither unduly sought nor repelled acquaintance; but, from the first, Helen was painfully aware of not having heard of her; and one is equally uncertain of people of whom one has heard nothing or heard too much. As soon as she learned what Mr. Evans's business was, she understood, of course, that they could never have been people that people knew; and, "Were they not a little Bohemian?" she asked, rather tepidly, one day, when an old friend of hers, whom she happened to meet, broke into effusive praise of them, on hearing that Helen was in the same house with them.

"My dear!" said Miss Kingsbury, summing up in a word the worst that a New England woman can say of a man, "he is *easy-going!* But he is *very* kind; and *she* is the salt of the earth."

"And some of the pepper?" suggested Helen.

"A little of the pepper, without doubt. But not a grain more than is good for him. He would be *nothing* without her," she added, in the superstition ladies love to cherish concerning the real headship of the family. "She makes up all her own things, and teaches that boy herself. And you have another person there who is really a character — Miss Root. If you see any of her work, you'll see that she is an *artist;* but you'll have to see a great deal of her before you find out that she's the best soul in the world. With her little time, and her little money, she does more *good!* She's *practical*, and she knows just how to help people that want to help themselves; poor girls, you know, trying to learn things, and get into occupations. And *so* rectangular she is!"

Miss Kingsbury ran off, professing an instant and pressing duty. "I'm coming to see you very soon. Good-bye, Helen, dear! You know how I feel for you," she added, tenderly.

Many other people, returning to town, looked Helen up, and left cards, and messages of friendly interest. She did not see any one that she could help seeing; she was doubly exiled, by her bereavement and her poverty, from the gay and prosperous world they belonged to; she knew that they were kind and meant well; but she knew that henceforward she could have few interests in

common with them. She was happiest when she was quite alone with her sorrow and with her love, which seemed to have sprung from it and to be hallowed by it. Their transmutation gave her memories and her hopes a common sweetness, which was sometimes very strange; it seemed as if Robert were present with her when she thought of her father, and that her father came to share all her thoughts of Robert.

Her old life had otherwise almost wholly dropped away from her, and after her return from Beverly, Margaret came often to see her; but the visits were a trial to Helen, and perhaps Margaret saw this, for she came at longer and longer intervals, and at last came no more. Helen supposed that she had taken a place, but waited patiently till she should re-appear.

She spent a great part of each day in writing to Robert and thinking about him, and trying to contrive their common future, and she made over all her bonnets and dresses. She saved a good deal of money by not buying anything new for the winter, and after her benefaction to Mrs. Sullivan she found that, even with these economies, she had no money for spring dresses. But that mattered very little; she had not cared, after she first put on black, to mark the degrees of mourning punctiliously; she had always dressed quietly, and now she could wear what she wore last year without treason to her grief. The trouble was that she would soon need money for other things, before any interest would be due from the money in Mr. Hibbard's hands, and she spent several days in trying to put into dignified and self-respectful terms the demand she must make upon him for part of her capital. She felt rather silly about it, and the longing to do something to earn a little money for herself revived. At the bottom of her heart was the expectation, always disowned and silenced, that Robert would somehow soon return; she had told Mrs. Butler that she knew he would come back as soon as he got her letter; but after the first keen pang of disappointment and surprise with which she realized that he could not at once ask leave of absence, or resign without a sort of ignominy, she heroically accepted the fact of a prolonged separation. She had caused it, she said to herself, and she must bear it; she must do everything she could to help him bear it. She idealized him in his devotion to duty, and worshiped him as if he had been the first man to practice it. She was more than ever determined not to be a burden to him in any way; she determined to be a help to him, and she had planned a pretty scene in which she brought out a little hoard of earnings, in addition to her five thousand dollars, and put them into Robert's hand the day after their marriage. It would be doubly sweet to toil for Robert; in the meantime, it was sweet to dream for him; and she had not yet decided how the sum she intended to bestow upon him was to be earned, when she found herself obliged to borrow of the future rather than to lend to it. But she resolved all the more severely to replace with interest what she borrowed; she would not leave a stone unturned; and she forced herself, in going to Mr. Hibbard's office, to pass the store where she had left her painted vases on sale six months before. She said to herself that they would be all in the window still; but when she dared to lift her eyes to it there were none. Then she said that they must have been taken out, and stuck away in some corner as too hopelessly ugly and unsalable.

The proprietor of the store came forward with a smile of recognition and of something more. "This is really a concidence," he said. "We have just sold your vases, and I was beginning to wonder where I should send you the money; I find there is no address on the card you gave me."

He filliped her card with one hand against the other, and looked at her with friendly pleasure, while she stayed herself against a show-case with a faintness which he could not see.

"Sold them!" she whispered.

"Yes, all three. Mr. Trufitt was looking at them yesterday, and asked me who did them. This morning, he called and took them."

"How dared he!" cried Helen, in a tumult of indignation, none the less appalling because wholly unintelligible to the person of whom she made the demand. At the mere name of Trufitt a series of odious facts had flashed without sequence into her thought: his obtuse persistence in love; his baldness; his stinginess; the fit of his pantaloons; his spiritual aridity, and his physical knobbiness. She hardly knew for which of his qualities she disliked him the most; but she recognized with perhaps superior disdain, that, after learning that the vases were her work, he had turned over for a whole day in his frugal mind the question of buying them. After presuming to think of owning her vases, he had also presumed to hesitate! It was intolerable.

"What right ——" she began on the innocent means of the offence, but corrected herself so far as to ask instead, "*Why* did you tell him who did them?"

"Really," said her victim, with just pique, "I saw no reason why I shouldn't. You gave me no charges on that point, and I gave the matter no reflection. I seized the first

chance that offered to sell them for you." He looked hurt and vexed; perhaps he had made his little romance about serving this very pretty young lady in her trouble and need.

Helen would not consider his kindness; in her own vexation, she continued to treat him *de haut en bas*. "I can't allow him to keep my vases," she said. "You must send for them."

"The vases were on sale," returned the proprietor, "and I sold them in good faith. I can't ask them back."

"*I* will ask them back," said Helen, grandly. "Good-morning." When she put her hand on the bell-pull at Mrs. Hewitt's, she remembered that the shop-man had not given her the money for her vases, and that she had again left him without her address. This was some satisfaction, but it was not enough; she would not rest till she had her vases back again, and had broken them into a thousand pieces.

But she found that the first thing she must do was to write to the people who had sold them, and apologize for the strange return she had made for the interest they had taken in her, recognizing the justice of their position and the absurdity of her own. It was not an easy note to write, but she contrived it at last, and that gave her courage to think how she should get her vases back from Mr. Trufitt, who had bought them, and had certainly a right to keep them. She knew why he had bought them, and this enraged her, but it did not help her; she felt that it would be putting herself in an asking attitude, however imperiously she demanded them again. If he yielded, it would be in grace to her; and he might refuse—very likely he would refuse. She had not decided in her own mind what she should do in this event, when she received a reply from Messrs. Pout & Lumley, inclosing Mr. Trufitt's money for her vases, less their commission. Messrs. Pout & Lumley regretted that their Mr. Lumley had not clearly understood Miss Harkness's wishes in regard to the vases she had left with them; but finding themselves unable to ask their return from the gentleman who purchased them, they had no course open to them but to send her the money for them.

Helen saw that she must have written her address at the top of her letter of apology, and that she must have seemed to them to have repented of her magnificent behavior on another ground, and to have tacitly asked for the money.

She broke into a laugh at the hopeless complication.

"Really," she mused, "I don't know whether I'd better be put into the Home for Little Wanderers or into the Insane Hospital;" and for the present there seemed no safety but in entire inaction. She was so much abashed at the result of her yesterday's work, that she remained with Messrs. Pout & Lumley's letter in her hand, wondering when she should have courage to go out again and renew her attempt to see Mr. Hibbard. At first, she thought she would write to him; but there seemed something fatal about her writing to people on business, and she hesitated. It was impossible to use this money of Mr. Trufitt's; she was quite clear as to that; and, with various little expenses, her money had dwindled to less than three dollars since her interview with Mrs. Sullivan. She let the morning slip away in her irresolution, and then she decided to put the whole affair off till the next day. She felt a comfort in the decision, merely as a decision, and she began to enjoy something like the peace of mind which moral strength brings. Perhaps the weather had something to do with her willingness to postpone any duty that must take her out of doors; it was a day that would scarcely have invited her to an errand of pleasure. For almost a week the weather had been relenting; and the warmth of yesterday had brought a tinge of life to the bare slopes of the Common, where for three months past the monumental dumpings of the icy streets had dismally accumulated; and along the base of these heaps a thin adventurous verdure showed itself, like that hardy vegetation which skirts the snow-line on the Alps. As Helen had walked across the planking on her way to Mr. Hibbard's office, she had heard a bluebird in the blue soft air high through the naked boughs of the elms, making querulous inquiry for the spring; and there had seemed a vernal respite even in the exasperation of the English sparrows. The frozen year, in fact, was awaking to consciousness, with secret pangs of resuscitation that now declared themselves in an easterly storm of peculiar spitefulness, driving against the umbrellas which Helen saw ascending the narrow hill-side street in gusts that were filled from moment to moment with sleet and rain and snow.

In the little grate in her room the anthracite had thrown off its first gaseous malice, and now lay a core of brownish-red under a soft, lurid blur of flame; and she stood before it thinking to herself that, rather than go out in that weather, she would spend some of Mr. Trufitt's money, as she called it, and smiling faintly at the demoralization which had succeeded her heroics, when some one rapped at her door. She turned away from the fire, where she had stood smoothing the front of her dress in the warmth, with a

dreamy eye on the storm outside, and opened the door rather resentfully. Mrs. Hewitt was there with a card in her hand, which she had apparently preferred to bring in person, rather than send up by the general house-work girl. Before she gave Helen the card, she said, with a studied indifference of manner that might well have invited confidence:

"I heard him askin' for you, and I showed him into the parlor on the second floor, till I could find out whether you wanted to see company."

Mrs. Hewitt made her own inferences from the flush and then the pallor with which Helen received the card; and while Helen stood staring at it, she added suggestively, "Seemed to have some kind of a passel, or, something 't he brought with him in the carriage."

"Oh!" said Helen, as if this idle detail had clinched the matter, "then, will you tell him, please, that I'll be down in a minute."

She hastily made a woman's imperceptible changes of hair and ribbon, and then descended to the parlor, with her line of behavior distinctly drawn in her mind. After a first impulse to refuse to see her visitor, and then a full recognition of the stupidity of such a thing, she saw that she must be frankly cordial. Mrs. Hewitt had hospitably put a match to the soft-coal fire laid in the grate, and it was now lustily snapping in the chilly air of the parlor; but Lord Rainford was not standing before it. He stood with his back to the door, with his hat in his hand and his overcoat on, looking out into the storm, whose national peculiarities might well have interested him. He turned when Helen came in, and she greeted him with a welcome which she felt must have the same effect of being newly kindled as the fire in the grate. He did not seem to notice this, and began a huddled and confused explanation of his presence, as if it ought to be accounted for and justified upon special grounds. Helen pulled the wrap she had flung on tightly around her, and concealing the little shiver that the cold air struck through her, asked him to sit down.

"The fact is," he said, "that I was anxious to put this little parcel into your own hands, Miss Harkness, and to make sure that it had reached you in safety." He gave her the package he had been holding, and then offered to relieve her of it.

"Oh, thank you," said Helen, ignoring it as well as she could, while refusing to give it up. She had gathered from the fact that Lord Rainford would not have felt authorized to present himself to her at that moment, if he had not this commission from the Rays; that the Rays had sent her the parcel by him; and she began to unravel the maze, in which he was involving them both, by that clew. There had been something in what he said about London, and Nice, and Rome, and Alexandria; but whether he had been with her friends at any or all of these points, she had not made out.

"Where did you see the Rays last?" she asked. "Were the Butlers with them? or—"

Lord Rainford laughed. "Why, the fact is," he exclaimed, "I haven't seen them at all! They made no stop in England, through some change of plans."

"Yes, I know," said Helen.

"And later, I gave up my winter in Egypt. I found that I couldn't go up the Nile, and get back in time—in time for the visit I had intended to make to America; and—and I had decided to come to America, and—so I came!"

"Yes," said Helen, a little dazed still. She added, to gain time for reflection rather than to seek information, "And you are fond of the Atlantic in the middle of March?"

"It wasn't so bad. We'd a very good passage. I found myself so well here, last year, that I've been impatient ever since to come back."

"I'm glad America agrees with you," returned Helen, vaguely.

"Why, I'm not here for my health, exactly," said Lord Rainford. "I'd some other objects, and Mr. Ray asked me to bring the little box from his wife for you."

"Oh, yes, I understand! They sent it to you from Egypt."

"Precisely. I assure you, it wasn't an easy matter to get it through your custom-house unopened."

"How *did* you manage? By bribery and corruption?"

"No. I wont say I wasn't tempted to try it. But I don't altogether like that sort of thing even in countries where they naturally expect it; and I couldn't feel that the inspector whose hands I fell into did quite expect it. I told him that it contained a present from one lady to another, and that I would rather deliver it unopened, if he could trust me to come back and pay the duty in case it proved to be anything subject to duty. I gave him my card and address, and I did go so far as to offer to deposit a sum of money with him as surety."

"How very, very kind of you," cried Helen, beginning to be charmed.

"Oh, not at all," said Lord Rainford, coloring a little. "I merely mentioned it because it led up to something that interested me. He looked at my card, and then he looked at me, and said, 'That it wasn't necessary between *gentlemen!*'"

Helen laughed at the man's diverting assumption of a community of feeling with Lord Rainford. "You must have been edified," she said, "with such an early example of American equality."

Lord Rainford looked rather mystified and a little troubled. "I don't know. I rather liked it, I believe," he said, tentatively; as one does who has not been taken in quite the way he expected.

"You are easily pleased," said Helen; and he seemed still more perplexed.

But as if he set these speeches down finally to some ironical intention in her, he went on: "He said I could 'take the box along,' and then he looked at the address on it, and said, 'Oh, 't's all right! I know Miss Harkness.'"

"Who in the world could it have been?" wondered Helen. "I never dreamt that I had a friend at court—or the custom-house."

Lord Rainford took out his pocket-book, and, to do this, he had to unbutton his overcoat. "Wont you lay off your coat?" asked Helen. "I believe we shall not freeze to death here, now. The fire is really making an impression."

"Thank you," he said, obeying. "He gave me *his* card. I have it here somewhere. Ah, here it is!"

Helen received it and gazed at the name. "No," she said, returning it with a shake of the head, "it doesn't throw any light on my acquaintance, and I don't exactly understand it."

"Perhaps it was some other lady of the same name."

"Perhaps. But I haven't asked you yet when you arrived; and that ought to have been the first question."

He seemed willing to evade it; but he said gravely that he had arrived that morning. "The fact is," he added, "I had them send the luggage to the hotel, and I—took the liberty of driving directly here."

"Why, this *is* zeal in stewardship!" cried Helen. She felt a girl's thrill of pleasure in it. To see Lord Rainford was like meeting an old friend. She had parted from the Rays and Butlers long since he had; but his coming on an errand from them seemed like news from them, and she found herself at home with him, and truly touched by his kindness. She had been too little abroad to consider whether she was behaving like an English girl under the circumstances, and she ended by behaving like an American girl. "Now, Lord Rainford," she said, "I'm going to do all I can to reward you, and if you were a woman you would feel very lavishly rewarded; I'm going to open this box at once in your presence."

"I'm sure you're very good," said Lord Rainford.

She put the box on a little table near them. "I hope it isn't the kind that opens with a screw-driver," she continued, breaking the line of barbaric seals which held the edge of the paper covering, and then coming to a second wrapper tied with an oriental cord of silk, for which she required the aid of Lord Rainford's penknife. "What a pity to break and cut such things!" she sighed.

"Why, I don't know," said the young man, not feeling the occidental strangeness to which the paper and the cord were poetry. "It's the way they put things up there. I dare say their dragoman had it done at a bazaar."

"Their dragoman! At a bazaar!" cried Helen, and now he dimly sympathized with her mood, and said—"Oh, yes, yes!" while she tore away wrapper after wrapper, vaguely fragrant of musk or sandal, and came at last to a box, inlaid with mother-of-pearl in the Persian fancy. She opened this, and found, under a note from Marian Ray, a set of gold jewelry: ear-rings, bracelets, and necklace, rich in the color of the unalloyed metal, and fascinating in their fantastic naïveté of design—as old as man, as young as childhood.

"Ah, yes," said Lord Rainford, smiling back her rapture in the trinkets. "Those goldsmiths' things. They're very pretty. And it's amusing to see those fellows work. They set up their little forge in the street before their doors, and make the things you've ordered while you're waiting."

"And the high, white house walls, and the yellow sun, and the purple shadows all round them?" cried Helen, dangling the necklace from her fingers.

"Well—ah—yes; you're quite right," said Lord Rainford. But he added, conscientiously, "There isn't much sun, you know. The street is very narrow; and I don't know about the walls being white; they're apt to be colored."

"Oh!" deeply sighed the girl, and a mist came into her eyes, as she dropped the pretty things back into their box. "Marian has certainly outdone herself," she said, shutting the lid. She re-opened it, and took out the necklace again, and one by one the bracelets and the ear-rings, and stood absently regarding them, held a little way off, with her head on one side. She was thinking of the night before her father died, when she put on that silver filigree of Robert's, and she had forgotten the young man before her. He made a little movement that recalled her to herself. "Oh, I beg your pardon," she said, softly. He had his hat in his hand, and she saw that he had taken up his overcoat. "Must you go? I can never thank you enough for all

the trouble you have taken." She stopped, for she had a sudden difficulty. It seemed savagely inhospitable, after what Lord Rainford had done, in the way he had done it, not to attempt some sort of return. But she felt sure he must see at a glance that she was not in her own house; the bare spectacularity of the keeping; the meager decoration of the mantel-piece and what-not; the second-hand brown plush furniture; the fire, burning on the hearth, as in a scene set for some house of virtuous poverty on the stage, must all be eloquent of a boarding-house even to unpracticed eyes; and Helen was in doubt what she ought to do under all the circumstances. She decided upon a bold, indefinite course, and asserted that they would see each other again before he left Boston.

"Thank you," he said. But he did not go. He looked vaguely round the room.

"Your umbrella?" she suggested, joining actively in the search.

"Ah, I don't think I brought one," he said, speciously.

When he was gone, Helen put on the trinkets, and found them very becoming; though, as she frankly owned to her reflection in the glass, a dark girl would have carried them off better. "That comes," she mused, "from Marian's want of feeling for color. I'm sure *she* chose them." She smiled a little superiority at the mirrored face, and then she started away from it in dismay. Of course, Lord Rainford had hesitated in that way, because he promised the customs officer to come back and pay duty on the box; and she had not offered to let him take it, and he could not ask for it. There seemed no end to this day's *contretemps*. He had not given her his address, and there was no telling, after that sort of parting, when she should see him again, if she ever saw him again. She had placed him in a cruelly embarrassing position, for he had given his card to that Mr. Kimball. The name was inspiration; she could at least go to the custom-house, and pay the duty herself, and trust to some future chance of telling Lord Rainford that she had saved his honor with Mr. Kimball. Kimball! She only wondered that she should have remembered the name.

She had no idea where the custom-house was, but she wrapped herself against the storm, and took a carriage at the nearest hack-stand. The janitor and messengers who passed her from one to another in the custom-house were of opinion that Mr. Kimball was on duty in East Boston; but the last who asserted this immediately added, "Oh, here he is now!" and called after a figure retreating down a corridor,—"Kimball! Here! You're wanted!" and Helen found herself, box in hand, confronted with her old friend, the policeman.

"Why, is it *you?*" she cried, as joyously as if she had met him in some foreign land.

"Well, I thought it must be you," he said, with the half-shy, half-jocose respect of that sort of Americans in the presence of a fashionable woman. It amuses them to see the women putting on style, as they would say; but they revere them as ladies all the same. Kimball touched his hat, and then pushed it back on his head in token of standing uncovered while they talked.

Helen could not wait till she had transacted her own business before she said, "But I thought you were a policeman!"

"Well, so I was the last time I saw you," returned Kimball. "I left the force about two months ago. Got kind of sick of it myself, and my wife was always in a stew about the danger, and bein' out so much nights, and the new collector was a friend of mine, and he gave me this place," said Kimball, briefly putting the case into Helen's hands. "That fellow behaved himself after that?"

"Oh, yes," answered Helen, knowing that Kimball meant the hackman whom he had rebuked in her behalf; "he was very civil."

"I thought I could fetch him," said Kimball. "I don't know as anything, while I was on the force, done me so much good as a chance like that now and then." He dropped his eyes suggestively to the box in Helen's hands; but he did not otherwise manifest any consciousness of it, and he left Helen to take her own time to say how glad she was to see him again and how grateful she had always been to him. When she arrived, in due course, at the box, he merely permitted himself a dry smile. "I told him I knew you"; and this time Helen understood Lord Rainford, and not the hackman. "I knew it would be all right."

"It was very kind of you, Mr. Kimball, and it's only a chance that it wasn't all wrong. Lord Rainford told me all about it, and I forgot to let him have the box to bring back to you till after he had gone, and then I hurried off with it myself, at once. I couldn't endure that you should think for a moment he hadn't kept his word."

"Of course not," said Kimball, sympathetically. "Full of diamonds?" he asked, jokingly, as he received it from her. He opened the lid, and then frowned regretfully at the trinkets. "Gold, do you suppose?"

"Oh, yes, they must be gold," said Helen. "It's a present."

"Just so. And, of course, you don't know what they cost. Well, now, I'm sorry, Miss Harkness," said Kimball, with a deep-drawn

sigh of reflection. "I guess I've got to have these things valued."

"Of course," said Helen, with a beating heart, at the bottom of which, perhaps, she accused the punctilious folly of forcing the jewels to official knowledge. She had her feminine limitations of conscience in regard to smuggling, and did not see *why* it could be wrong to bring in dutiable goods if the customs officers did not know it. She had come out of regard to Lord Rainford, and not at all from tenderness for the public revenue; and she had a sort of vague expectation that the Government would politely decline to levy any impost in recognition of her exemplary integrity.

"You just sit here," said Kimball, finding her a chair which one of the messengers had temporarily vacated, "and I'll see about it for you. I'll be back in half a minute." He was gone much longer, and then he returned with an official paper in his hand, and a fallen countenance. "Well, I done everything I could, Miss Harkness," he said, in strong disgust. He was a man who had enjoyed official consequence largely as a means of doing people unexpected favors, and was deeply mortified at the turn this affair had taken. "You've got to pay fourteen dollars and seventy-five cents on this box. I wouldn't say it to every one, and I shouldn't want it reported, but *I* think it's a regular swindle."

"Oh, no," said Helen, sweetly, but with a deep inward bitterness; and finding her pocket with that difficulty which ladies seem always to have, she found her pocket-book, and in it two dollars and a half.

"I shall have to leave the box with you, and come again," she said. After resolving to borrow Mr. Trufitt's money for the payment of possible but improbable duties, she had come away and left it at home in the letter inclosing it.

"No, take the box along," said Kimball, measurably consoled at this unexpected turn. "It's just the way with *my* wife. Never knows how much money she takes with her, and comes back with her bank-bills balled up into little balls like gun-wads, and her silver layin' round all over the bottom of her bag—what there is to *lay* round. *Never* gets home 'th more than sixty-two and a half cents. Don't you fret, Miss Harkness; *I'll* make it all right, and you can make it all right with *me*, *any* time."

He would not listen to Helen's protests, but forced the box back into her hands, and walked along the corridor to the vestibule with her, largely waiving each return of her self-reproach and gratitude, and at the door resolutely changing the subject as he took a card from his waistcoat-pocket.

"Lord *Rainford!* Curious chap. *Lord* Rainford! Don't know as I ever saw many lords before," he said, with Yankee caution. "Don't know as I ever saw *any*," he added, with Yankee conscientiousness. He pondered the card with a sarcastic smile, as if amused that any fellow-creature should seriously call himself a lord, and then broke out in a sort of repentance: "Well, he's a *gentleman*, I *guess*. Had his declaration made out fair and square, and opened up all his traps, first off, like a man. *Forced* 'em onto your notice, as you may say. No hangin' back about *him*. Well!" he added, after a final inspection of the card, "it *wa'n't* quite regular, as you may say, to let him take the box along without openin' it; but a man has *some* discretion, I suppose; and—well, the fact is, I took a fancy to the fellow. Seemed kind of *human*, after all."

"Oh, Mr. Kimball," cried Helen, deeply enjoying the inspector's condescension, but with a sudden superficial terror at the thought that she had not Lord Rainford's address, and should not know how to inform him that his word had been kept for him, "let me see his card, please!"

"Why, certainly, take it along," said Kimball. "Or, I don't know," he added, sheepishly, "I thought my wife might like to see it—kind of a novelty, you know."

"Oh, thank you! I don't want to keep it," said Helen, returning it after a swift glance. "I merely wanted to look at it. Thank you ever so much!"

When she reached home she wrote two letters—one to Kimball, inclosing the money he had lent her; and another to Lord Rainford, telling him what she had done. She felt finally that the whole affair was very funny, and she suffered herself to run into a sprightly little account of her adventure, which she tore up. She wrote it all out fully in the letter to Robert, to which she gave up the whole afternoon; but to Lord Rainford she merely said that she thought he would have been amused at Mr. Kimball's remarks.

XIII.

THE next day, Lord Rainford came to acknowledge her note in person, and he excused himself for coming rather early on the ground of an intolerable impatience to know what Mr. Kimball had said.

"Oh, did I promise to tell you?" asked Helen, not well remembering just what she had written.

"No, I can't say that you did," he said, with a candor which she began to see was unfailing. "But I thought, perhaps, you might."

"I'm not sure about that. But I was thinking that if you were disappointed when you were here before not to find any of us aggressively American, you might be consoled by studying Mr. Kimball; he's so absolutely and wholly American, that he takes every other condition of things as a sort of joke."

"Ah, yes," said Lord Rainford, "I understand. I think I observed something of the sort in that class of people. But I didn't meet it in — society." He looked at her inquiringly, as if he spoke under correction.

Helen laughed. "Oh, society has all been to Europe, and has lost the old American point of view — or thinks it has."

"Thinks it has?" he repeated, with interest.

"Why, I mean that, with all that acquiescence which you found so monotonous, there wasn't one of those people — except a very few sophisticated instances — who looked at you at all as people in European society would. You were hopelessly improbable to them, no matter how hard they tried to realize you, as a — nobleman. Excuse me!" cried Helen, "I *didn't* intend to be personal!"

"Oh, not at all, not at all. It's very interesting, I'm sure. It's quite a new view of the matter. And *you* ——"

"Now *you* are personal!"

"No, no, I don't mean that. Or, yes, perhaps I did."

"Well, then, even I, — although I am able to lecture so clearly and dispassionately about it, — I'm not sure that I am able to take the social state of Europe seriously either."

"Really? I didn't find you such deeply dyed democrats."

"We're not — in our opinions; you found that out; nor in our practice, I suppose. But in our traditions and — I've been talking so bookishly already ——"

"Oh, it's quite what they told me to expect in Boston!"

"Then you *wont* mind my saying — in our *environment*," said Helen, with a laugh, "we are. For instance, — and now I'm going to be horribly personal, — so long as we supposed that Mr. Ray had introduced you as *Mr.* Rainford, you were real enough; but as soon as we found that you were Lord Rainford, you vanished back into the stage-plays and story-books."

"Oh, I'm very sorry," he said, with an accent of so much earnestness that she laughed again, and now with a mischievous pleasure which he must have perceived, for he added, more lightly, "It's really very uncomfortable, you know, to be going about as a fictitious character."

"You can't keep it, and *we* can't," said Helen. "But I suppose if you were to live here a very long while, and were to be very, *very* good, we might begin to believe a little in your probability."

They talked of other matters, and she let her visitor go, with an uneasy misgiving which haunted her throughout the morning, and still lingered about her when Clara Kingsbury came later in the afternoon to beg her to lunch with her the next day.

"I know you've not been going out, but this will be an errand of charity. Last night, I picked up, of all things in the world, a live lord, and before I knew it I had asked him to lunch with me, and he had accepted. I suppose that lords are lunched very much like other mortals — if lords *are* mortal; — but really, when he told me that he had met you, I was ready to weep on the first person's neck for joy. You *do* know him, don't you: Lord Rainford, whom you met last fall at the Butlers?"

"Oh, yes," said Helen, "he brought me a message from them yesterday."

"How very odd!" cried Miss Kingsbury. "I wonder he didn't mention meeting you yesterday."

"He didn't mention going to lunch with you to-morrow," said Helen, defensively, betraying the fact that she had seen him since.

Miss Kingsbury ignored it. "Then it must be his English reticence. How droll they *are!* I should think it would worry them to keep things on their minds the way they do. You *must* let me send the coupé for you! Lord Rainford, and Miss Harkness for the first time in many months, as the play-bills say: really, for a lunch in Lent ——"

"Oh! I think you must excuse me, Clara," Helen began. "You know, I *can't* meet people."

"I quite understand, dear," said Miss Kingsbury. "There are not going to be *people*, or I should not have ventured to ask you. There are only to be Professor and Mrs. Fraser: Lord Rainford wanted especially to talk over Aztec antiquities with him, and I promised to get him to come. But I must have some other young lady besides myself; I can't let it be all Aztecs and antiquities. You must come to keep me in countenance, sitting up there behind the tea-pot like a — a — teocalli."

Helen laughed, and Clara immediately kissed her. If it were to be such a mild little affair, she felt that she could certainly go; she could see how Clara would hate to seem to have paired herself off with Lord Rainford,

and she said, "Well, Clara, I will go; but I believe that, so far as Lord Rainford is concerned, I shall go as an act of penance. He was here this morning again."

"Oh!" popped out of Miss Kingsbury's mouth.

"And I'm afraid I said something inhospitable to him—something, at any rate, that I'd like to do away the impression of."

"Oh! *do* tell me what it was, Helen, dear! I'm always saying such *hideous* things to people!"

Helen explained, and Miss Kingsbury silently reflected. "I suppose my joking about it annoyed him."

"What *did* he say?" pleaded Miss Kingsbury.

"He said it was very uncomfortable going about as a fictitious character."

"But you didn't *make* him a fictitious character, Helen!"

"No; but I can see how he might misunderstand——"

"They're very sensitive," assented Miss Kingsbury, with a sigh. "Really," she continued more briskly, "for people who have gone tramping about the world ever since they could walk—and they began to walk *very* early—and crushing other people's feelings quite into the mire, they're *extraordinarily* sensitive. One would think that they had always behaved themselves with the utmost delicacy and consideration, instead of scolding and criticising and advising wherever they went."

"Yes," said Helen. "But all that doesn't excuse *me*, if I said too much."

"Well, then," said Miss Kingsbury, "come and take some of it back; or all. Tell him that the British aristocracy is the one only solid and saving fact of the universe! Goodbye, dear! Don't worry about it. I dare say he was delighted!"

Helen was afterward sorry that they had not dressed a little more. She was necessarily in mourning, and Lord Rainford was dipped in the gloom of her crape, and of three black silks—Mrs. Fraser's best black silk, Miss Kingsbury's Vermont aunt's only black silk, and the black silk which Miss Kingsbury herself wore, in some mistaken ideal of simplicity. Helen longed to laugh, but remained unnaturally quiet.

Perhaps the black silks were too much for the Aztecs. Lord Rainford had the Englishman's stiffness, and Professor Fraser had the Professor's stiffness; they seemed unable to get upon common ground, or to find each other's point of view. They became very polite and deferential, and ended by openly making nothing of each other. The Frasers were obliged to go early, and Helen shortly afterward made a movement toward departure.

Miss Kingsbury laid imploring hands on her. "*Don't* go!" she tragically breathed. "Stay, and try to save the pieces!" and Helen magnanimously remained; under the circumstances, it would have been inhuman to go. She brightened at Miss Kingsbury's imploring appeal; she became funny, and they had a gay afternoon. When she said at last that now she really *must* go, she was scared to find that it was half-past four. She hurried on her sack and bonnet and rubbers, and when she came down-stairs, Lord Rainford, of whom she had deliberately taken leave, was there, hospitably followed out of the drawing-room by Miss Kingsbury.

"I forgive your not taking the coupé," she said subtly, seizing Helen's hand for a grateful pressure at parting.

"I much prefer to walk, I assure you," said Helen, "after being mewed up in the house all day yesterday. Good-bye."

Miss Kingsbury's man opened the door, and Lord Rainford stood aside for Helen to pass out. But he hurried quickly after her.

"If you're walking, Miss Harkness," he said, with an obvious effort to continue the light strain in which they had been laughing and talking, "I really wish you'd let me walk with you."

"Why, certainly," said Helen. "I shall be very glad."

But they walked away together rather soberly, as people do after a merry time indoors. There was a constraint on them both which Helen had to make a little effort to break. Whatever caused it on his part, on hers it was remotely vexation that she had allowed the afternoon to slip away without going to see Mr. Hibbard about her money. She must wait again till the morning.

"I'm afraid," she said, "that you found Professor Fraser rather an unsatisfactory Aztec."

"Oh, no. Not at all. He's extremely well informed, I dare say. But we approach the subject from very different points. He is interested mainly in the pottery, as the remains of an arrested indigenous civilization; and I, as an amateur Egyptologist, was rather hoping to—ah—hear something new about the monuments—the architectural evidences. But the ground has been pretty thoroughly traversed in Mexico, and we can only look for fresh results now in Yucatan and Central America."

He rattled off the statement without apparent interest in the matter and with something of present impatience. The effect was

to make Helen laugh a little, at which he seemed grateful.

"I suppose you have come over to look up the ground for yourself," she began; but he hastily interrupted.

"No, I can't say I came for that, exactly. I can't say I came for that. I should like extremely to see those things for myself; but I didn't come for that."

Helen was amused at his scrupulous insistance on the point, and had a mischievous temptation to ask him just why he *had* come, then; but she contented herself with saying, "I always wonder that English people care to come to America at all. I'm afraid that if we had Germany and Italy at our back-door, we shouldn't care to cross the Atlantic for a run to Colorado and back."

"The Continent is rather an old story with us, you know. Of course, the towns are a good deal alike, here, after you leave Boston, and there is nothing to see in the usual sight-seeing way; but the conditions are all new, and they're interesting; yes, they're interesting. But I can't say exactly ——"

Helen felt a nervous inability to let him define, as he clearly intended, that it was not exactly the new conditions either that had brought him to America, and she turned a smiling face from the anguish of sincerity that was urging him on, and looked about her with the hope that something in their surroundings would suggest escape for them both.

"I suppose," she said, "that you know Boston very well by this time?"

"No, I don't know it very well," replied Lord Rainford. "But I believe I know something about this quarter of it. This is where your principal people live—professional people, and large merchants?"

"All sorts of people live everywhere, now," said Helen, with a little touch of her superiority; "and I can't say that Beacon Street is any better than Commonwealth Avenue. Papa was in the India trade," she continued, "and we lived just here in Beacon Steps." She remembered what Captain Butler had said of the India trade and its splendor, and she had a tender filial pride in speaking of it.

Lord Rainford had not caught the word. "In trade?" he repeated.

"His business was with Indian products of all sorts," Helen explained.

"Ah, yes," said Lord Rainford. He walked on in a silence which Helen did not heed particularly. He must have been pondering the complications of American society, through which he was walking about the most exclusive quarter of Boston with the daughter of a person who had bartered beads and whisky to the aborigines for peltries. "Really," he said, at last, "I didn't suppose there were enough of them left in this region to make it worth any one's while. But perhaps he carried on the business at a distance—in the West?"

They came to an involuntary pause together, in which they stared at each other. "What—*do* you mean?" cried Helen.

"Upon my word, I don't know whether I ought to say," returned Lord Rainford.

"You didn't—you *didn't* suppose," Helen continued, "that papa traded with *our* Indians?" Lord Rainford's silence confessed his guilt, and she added, with a severity which she could not mitigate, "Papa's business was with India; he sent out ships to Calcutta!"

"Oh—oh!" said her companion. "I beg your pardon."

Helen made a polite response, and began to talk of other things; but in her heart she was aware of not pardoning him in the least; and she had an unworthy satisfaction in leaving him in evident distress when they parted.

The next morning, at the earliest permissible hour, Mrs. Hewitt brought her his card, with a confidential impressiveness that provoked Helen almost to the point of asking Mrs. Hewitt to say that Miss Harkness was not well, and begged to be excused; but she repented of the intention before it was formed, and went down to receive her guest.

She received him coldly, and his manner confessed the chill by an awkward constraint in the commonplaces that passed before he broke out abruptly with, "I know I've vexed you, Miss Harkness, and I'm very unhappy about it. I'm not ready,—I don't suppose I've any tact at all,—but it would grieve me to think that I had misunderstood you yesterday in a way to annoy you."

"Oh, don't speak of it!" cried Helen, with the generosity which his frankness evoked. "There was never anything of it, and now it's *all* gone." She began to laugh at the droll side of his blunder, and she said, "I was afraid that I must have seemed very rude the other day, in openly reducing you to a fairy prince."

"No, I rather liked that," said Lord Rainford. "It interested me, and it explained some things. I'm sure people get on better in the end by being frank."

"Oh," said Helen, "there's nothing like frankness"; and, at the same moment, she felt herself in an intricate and inextricable coil of reservations.

"I think the Americans particularly like it," he suggested.

"We expect it," said Helen, with a subtlety which he missed.

He went on to say, with open joy in the restoration of their good understanding:

"The distinctions you make in regard to different kinds of trade rather puzzle me. I don't see why cotton-spinning should be any better than shoe-manufacturing, but I'm told it is."

"Why, certainly," said Helen.

"But I don't *see* the 'certainly!'" he protested with a laugh.

"Oh, but it is!" explained Helen.

"Ah," he returned, with the air of desisting, "it's my defective education, I suppose. But if people go into trade at all, I don't see why they shouldn't go into one thing as well as another. It appears all the same to — us."

The little word slipped out; and neither of them thought of it at the time. He went away, happy in having made his peace; she parted from him with sufficient cordiality, and as soon as he was gone this word, by which he had unconsciously distinguished between them and classed her, began to rankle and to sting. When it came to herself, she had the national inability to accept classification, which seems such a right and wise arrangement to Europeans, and which some Americans uphold — till it comes to themselves.

She could not get rid of her resentment by asking herself what Lord Rainford's opinions and prejudices were to her, and resolving not to see him if he came again; and she was so hot with it, when she went out in the afternoon to Mr. Hibbard's office at last, that she must have seemed, to the clerk who told her he was not in, to have some matter of personal question with the delinquent lawyer.

She stopped a moment on her way home at the window of a picture-store, attracted by some jars of imitation faïence, and she went in to ask something about them; the sight of them suddenly revived her belief that she could still do something of the kind, and spare herself the shame of encroaching upon her capital.

A gentleman turned round from looking at them on the inside of the window, and she confronted Lord Rainford.

"Ah, Miss Harkness!" he said. "Was it you who were spell-bound outside there by these disagreeable shams?"

His words struck her new hopes dead.

"They *are* ghastly," she said, with society hardness. Then Miss Root's words came involuntarily to her lips, "I pity the poor wretch that expects to live by painting and selling them."

That door, she felt, was forever closed against her, even if she starved on the outside. The shock brought the tears into her eyes behind her veil, and she remained staring at the fictitious faïence without seeing it.

"Frankly, now," said Lord Rainford, "don't you think that all effort in that direction is misdirected, and that the world was better before people set about prettifying it so much?"

"Frankly," said Helen, hysterically, "I don't believe I like frankness as much as you do."

He laughed.

"If you have ever decorated pottery, Miss Harkness, I take it all back."

"Oh, it isn't a question of that," said Helen, breathlessly. "It's a question of what else the poor girl, who probably did the things, shall turn to if she stops doing them."

She had a kind of dire satisfaction in dramatizing her own desperation; and the satisfaction was not diminished by the fact that these ideas had come into her head since she had denounced frankness, to which they had no relation whatever. She had meant — if she meant anything by that denunciation — to punish him for the tone of his talk in the morning. She had not forgotten his patrician *us*. But the talk was now far from that, and he had not been punished.

"Ah," he said, with feeling that she respected in spite of her resentment, "I should be sorry if I seemed indifferent to that side of the question. It was only that I hadn't thought of it."

"I didn't mean that," she returned, with an aimlessness from which she thought to escape by asking, "Is there anything upstairs?"

"Yes," he said; "a very beautiful picture — I fancy a very American picture which I wish you'd interpret for me a little."

They mounted the thickly carpeted stairs to the pretty little gallery, where there was a gentleman with his hat off, after our fashion in picture-galleries, and two suburban ladies, with a multiplicity of small paper parcels, in awe-stricken whisper; but they all presently went out, and left her alone with Lord Rainford before the painting.

A yellow light fell rich into an open space in the primeval New England forest, and revealed the tragedy of an arrest for witchcraft, — an old woman haled away in the distance by the officers, with her withered arms flung upward in prayer or imprecation; and in the foreground a beautiful young girl cowering at the door of the cabin, from which her mother has just been torn. The picture was an intense expression of the pathos of the fact, which seemed as wholly unrelated to canvas

or pigment, in the painter's poetic treatment, as if it were his perfect dream of what he had meant to do.

"Yes!" said Helen, with a deep sigh of the impassioned admiration with which a Boston girl devotes her being for the moment to the book or picture she likes.

"One of your Boston painters?" asked the Englishman.

"*The* one," answered Helen, and she launched out in a fury of praise, while he continued attentive to her rather than to her words.

"I suppose you can't understand how it afflicts me," he said finally, "to find any of the errors and sufferings of Europe repeated here, where the race seemed to have such a fair new beginning."

Helen laughed as people do at mysterious grievances. "Why, no; as far as such things are historical, I believe we're rather proud of them. They do something to satisfy the taste for the picturesque, though after all they're such a mere morsel that we land in Europe perfectly ravenous."

"If they were all historical, I shouldn't mind," said the young man. "It's finding our current superstitions accepted here that surprises and disappoints me."

"You don't mean to tell me that you find any imperfections — domestic or foreign — in us *now?*"

"Ah, you get behind my joking depth very soon," he protested. "I told you once that I was a serious person."

"I didn't believe you could be serious about it!"

"I was, I assure you. I suppose it was my habit of taking things very seriously that put me at odds with matters at home, and that puts me at odds with matters here, where I once fancied that I might be rather more of the regular order."

"I don't understand," said Helen; and being curious, and being fatigued, she dropped into one of the chairs that the suburban ladies had vacated.

"I mean that this morning I was trying to express the feeling which has made me a sort of white crow among my own people, and which doesn't seem even credible here. I was very far indeed from wishing to imply disrespect for any sort of usefulness — which is the only thing I really respect in the world. Did you understand me to do so?"

"Not exactly that," said Helen, with a reserve which he must have seen was as yet inexpugnable.

"I dare say it was one of the misfortunes of my being a sickly boy, bred at home, apart from other boys, and indulging himself in all sorts of fancies,— but I used to imagine that in America our distinctions — criterions — didn't exist. When I began to know Americans, at home as well as here, it seemed to me that they were often more subservient — more eager to get on with people of rank — than Englishmen, even. I confess it puzzled me, and you're the only American — if you'll excuse my being so personal, as you say — who has at all explained to me. I can see now how they may have a romantic — an historical — interest in knowing such people, and that they are not merely tuft-hunters in the ordinary sense."

Helen could not tell whether he was speaking in irony or in earnest; she dropped the glance she was lifting to his face, in a little fear of him.

"But I believe I care more for the American ideal than most Americans; and I have been vexed that I should have said something this morning that I saw put me further than ever in the wrong with you. I assure you that I am very far from thinking better of myself for belonging to an order of things that I believe to be founded and perpetuated in ignorance and injustice. I would really rather have been one of the Pilgrims who came over in the *May-Blossom* ——"

"*Flower*," said Helen, helplessly correcting him.

"*Flower* — I beg your pardon — than one of the robbers who came over with the Conqueror!"

He seemed to think this a prodigious tribute; but Helen could not even make a murmur of grateful acceptance. Those radical ideas, in which he expected her to sympathize, were ridiculous to her; she had always heard them laughed at, and she could not imagine how an Englishman of rank could entertain them, though she had heard that such Englishmen sometimes did, for awhile; to hear him talking in that way of his own order made him seem not so much unnatural as impossible; it was so unexpected from him that she felt a little afraid, as if he were not quite in his right mind; but she had so far a compassion for his mania that she could not find it in her heart to tell him that he had totally misconceived her, and he went on to explain further:

"And I was merely trying to say that I thought it odd, in the society where you are all commoners together ——"

"Commoners!" cried Helen, in astonished recognition of the fact.

"That there should be any such distinctions as ours," he continued, without heeding this effort in her. "I'll go further, and say that I thought it preposterous; and the other

day, when I fell into that unaccountable blunder in regard to the India trade, I assure you I had no such feeling as you—as you—might have supposed. If I venture to speak of something that Mr. Ray let drop in one of his letters"—he added, after a little embarrassed pause—"about your determination to trust to yourself and your own efforts rather than accept any sort of dependence, it's because I wish to tell you how much I revere—and—and—honor it. It only endeared you to me the more, Miss Harkness!" he cried, while she began to look about her with a wild hope of escape. "It was for your sake that I came back!"

They were quite alone, and if it were to come to this, it might as well have come to it here as anywhere else. Helen realized the fact with a superficial satisfaction following her superficial terror of the publicity of the place.

"Ever since I first saw you——"

"Oh, don't say any more! Indeed, you mustn't! Didn't the Rays—didn't they tell you——"

"I haven't seen them. Before I went home, I knew that your father's circumstances—— But I beg you to do me at least the kindness to believe that it made no difference at all. God knows, I never considered the circumstances or made them an instant's question."

"You are very kind, Lord Rainford; generous, but——"

"No. It pleased me to think you had nothing. I would rather have found you as I have than in the best house in your town——"

Helen tried to interpose again, but he would not let her speak.

"All that I understood from Ray only made me the more impatient to tell you that I love you for what you are—for your courage, your sincerity, your truth to yourself; and if you think that your having——"

"Oh, it isn't that at all!" cried Helen, piteously, compassionately. To a girl who had never dreamt of being loved for anything but herself, and in her quality of well-born and well-bred American could not imagine herself less than the equal of princes, Lord Rainford's impassioned misconceptions contained as many offences as could have been put into as many words; but she forgave them all, to the pain that she saw that she must inflict. He had misunderstood everything; all her assumptions of equality, on his own plane, had been thrown away upon him; she had only been his equal as he ordained it and condescended to her level. But she could not be angry with him, since she was to crush him with the word she must speak. She had never forgiven herself for her reckless behavior the first time they met; and now he must have taken all her kind sufferance, all her hospitable good-will of the past week—which she had shown in atonement—as invitation for him to hope, even to expect. She hung her head, but she must stop him at once, and "Oh, Lord Rainford," she murmured, "I'm engaged!"

He turned very white.

"I beg your pardon," he said, simply and quietly.

"I've been very greatly to blame from the beginning; I see it now, and I ought to have seen it before. But that first day, when I met you, I was very unhappy—I hardly knew what I did; I'm afraid I didn't care. I had driven away the dearest friend I had by my foolishness, and he had left me, hating me. It made me desperate. But it all came right very soon again; and it's he—— It's cruel of me to be telling you this; but I want you to believe that I do value your regard, and that since you've been here this time I've only tried to do what I could to remove that first impression, and to—to—to— You *must* forgive me!"

"Oh, yes," said the young man, with a bewildered look.

"I *do* see how true and good you are, and I—— Any girl might be proud and glad, if she were not bound."

"Good-bye," said Lord Rainford, abruptly. She took his hand in a clinging, pitying pressure; she would have liked to detain him, and say something more, to add these futilities with which women vainly seek to soften the blow they deal a man whom they value, but do not love. But the useless words would not come to her lips, and she must let him go without them.

XIV.

HELEN hurried home, and ran up to her room. She had thought she wanted to hide; but now she found that she wanted to walk, to run, to fly, to get into the open air again, to escape from herself somehow. She was frantic with the nervous access of which, now that Lord Rainford was gone, she had fallen the prey. She was pulling on her gloves, as she rushed down-stairs, and she almost ran over the servant, who was coming up with a card in her hand. She stopped short, and the girl gave her the card.

"For *me!*" she cried in wild exasperation. "I can't see anybody! Say that I'm going out. I can't see *any* one!"

A little old gentleman, with his overcoat on, and his hat in his hand, who must have overheard her, came out of the reception-

room, and stood between the foot of the stairs and the street-door.

"I wish to see you, Miss Harkness, on very important business."

"I can't see you now. I can't see *any* one! I don't know you, sir! Why do you come to me?" she demanded indignantly, and quivering with impatience.

"My name is Everton. I bought your father's house when it was sold last fall at auction, and I came to see you in regard to some circumstances connected with that purchase."

"I don't know anything about the circumstances," cried Helen. "You must wait till Captain Butler gets home."

"I was sure," said Mr. Everton, with insinuation that arrested her in spite of herself, "that you knew nothing of the circumstances, and from what I knew of your father, I felt certain that his daughter would like to know of them."

"Please tell me what you mean," said Helen, and with a glance at the gaping servant-girl, she pushed open the reception-room door. Mr. Everton politely refused to enter first, and he softly closed the door when they were both within.

"It is simply this, Miss Harkness," said Mr. Everton, who had a small, hard neatness of speech, curiously corresponding to his small, hard neatness of person. "I have reason to believe—in fact, I have evidence—that I was the victim of a fraud on the part of the auctioneer; and that I was induced to outbid, by five or six thousand dollars, bids that were cried by the auctioneer, but that had never been made at all."

"I don't understand," faltered Helen.

Mr. Everton explained, but she shook her head.

"This is all a mystery to me. Why don't you wait till Captain Butler returns? Why do you come to me?" She suddenly added: "Or, no! I am *glad* you came to me. I can't suffer any doubt to rest in your mind for an instant: if you have been wronged, that's quite enough. Thank you for coming." She rose with a splendor which seemed to increase her stature and diminish Mr. Everton's. "I was just going out, and if you will come with me, I will go at once to Mr. Hibbard's office with you. He has charge of my affairs in Captain Butler's absence. If there has been any mistake, I am sure that he will have it corrected immediately."

She started out with Mr. Everton at her side, and swept haughtily on for several squares. Then she found herself trembling, and "I wish you would call a carriage, please," she said, faintly.

When they arrived at Mr. Hibbard's office, Mr. Everton allowed her to pay for the carriage he had shared with her. She could not quell her excitement when she entered the lawyer's private room with him. "Mr. Hibbard," she began, in a key which she knew sounded hysterical, and which she despised, but was helpless to control, "Mr. Everton thinks that he was cheated in the purchase of our house; and I wish you to hear his story, please, and if it is so, I wish him to be righted, no matter what it costs."

"Sit down," said the lawyer. He placed a chair for Helen, and allowed Mr. Everton to find one for himself, and then waited for him to begin. Mr. Everton was not embarrassed. He behaved like a man secure of his right, and told his story over again, straightforwardly and clearly. Mr. Hibbard smiled so lightly and carelessly at the end, that Helen felt at once that it must be all rubbish, and that it would be perfectly easy for him to undeceive Mr. Everton.

"Why didn't you come to me directly with this story, Mr. Everton?" asked the lawyer.

"I don't know, Mr. Hibbard," returned the old man, keenly, "that I'm obliged to account to you for my motives. I don't know but that I should have preferred to communicate with you through my lawyer, if it had not been for this young lady, who felt sure that you would see justice done."

The lawyer smiled at an assertion which was evidently not made to weigh with him. "*You* ought to know by this time, Mr. Everton, that justice is an affair of the courts, and that lawyers look after their clients' interests."

"I don't want you to look after mine at the expense of justice, Mr. Hibbard," said Helen, nervously, pulling herself back to the point from which she had lapsed at Mr. Hibbard's smile.

"We will try to do what is right," said the lawyer, in a way that made her feel rather silly. "But we wont do anything rashly because two romantic young people have decided that it is right without consulting any one else."

If Mr. Hibbard expected Mr. Everton to enjoy this joke, he was mistaken. "I am quite willing," said the old gentleman, grimly, "to leave the affair to the courts."

"If I hadn't your word for that, Mr. Everton," returned the lawyer briskly, "I should doubt your willingness to do anything of the kind."

"Why?"

"Because you know as well as I do that you have no case, that all your suspicions and impressions, and conjectures and hearsay, wouldn't amount to *that* in court." The

lawyer snapped his fingers. "You know very well that you went to Miss Harkness to fortify yourself at the expense of the weakness you hoped to find in her, and that you have done an irregular and ungentlemanly thing in annoying her with this matter. I am sorry to say it to so old a man as you. Did you expect to extort money from her? Probably you were surprised that she chose to consult me at all. Miss Harkness, I advise you to go home, and think no more about this matter. There's nothing of it!"

The lawyer rose, as if to end the interview; but Mr. Everton remained seated, looking through the papers of a long pocket-book he had taken from his coat and unfolded upon his knee, and Helen remained seated, too, fascinated by the old man's quiet self-possession.

"I have something here to show you," he said tranquilly, offering the lawyer the paper which he had found. "And I wish you to understand," he added, "that I am not here to be instructed as to the conduct of a gentleman, or to account for my conduct in any way. I prefer that you should not attempt to account for my possession of this paper; and if you ask me any questions in regard to it, I shall not answer them. It is sufficient for you to consider whether it is worth while for you to go into court against it. I was willing, and am still so, to spare the scandal attending such an affair in court, but I am determined to have the sum out of which I have been defrauded."

The lawyer was reading without apparent attention to what Mr. Everton was saying; but when he had gone through the paper again, he turned to Helen and said, reluctantly: "Miss Harkness, it's my duty to tell you what this paper is; it's a confession from the auctioneer that he did invent a series of bids by which he ran the price of the house up from thirty to thirty-five thousand dollars. I haven't the slightest idea that the case, if brought into court, would be decided in Mr. Everton's favor on any such evidence as this; in fact, I think it would not be easy to bring the case into court at all. He hasn't obtained the paper for any such purpose. He has obtained it with a view of frightening you into the payment of a sum—I don't know what figure he has fixed on in his mind—to keep the matter still. Now, I advise you not to pay anything to keep it still—not a cent." He folded up the paper and handed it back to Mr. Everton, who put it into his pocket-book again.

"Will you let me see it, please?" said Helen, gently. He gave her the paper, and she read it, and then restored it to him. After awhile she said: "I am trying to think what papa would have done. Wasn't Captain Butler at the auction?—wouldn't he have suspected, if anything had gone wrong?"

"Yes, certainly," said the lawyer.

"And if he had had any misgivings——"

"He would have come to me with them, and I should have told him not to pay the slightest attention to them," said Mr. Hibbard, promptly. "My dear Miss Harkness, the whole thing is preposterous. That fellow Mortimer is a scamp, but he isn't such a scamp as he professes to be. If Mr. Everton will excuse my frankness, I will say that I believe this is purely a financial transaction between himself and Mortimer. The fellow had heard of Mr. Everton's suspicions; and when he wanted money very badly, he went to him and sold out—for a sum which Mr. Everton's delicacy would prevent him from naming, but probably something handsome, though Mortimer has been going to the dogs lately, and he may have sold out cheap."

Mr. Everton, having folded up his paper and put it back into his pocket-book, and restored that to his breast-pocket, rose, and buttoned his coat over it. "I'm sorry, Miss Harkness," he said, "that you haven't a better adviser. I can't expect you to act independent of him, and that's your misfortune. I knew your father, and he was a very honest man. Good-morning."

"He was too honest," cried the lawyer, "to make any difficulty about paying you your cut-throat usury."

"My loan came at a time, Miss Harkness, when your father could get money nowhere else, and it saved him from bankruptcy. Good afternoon."

He took no notice of the lawyer in quitting the room, and when he was gone, the latter broke out with, "I hope he will press this to an issue! I think I could give him something to think of, if I could get a chance at him in open court. The old scoundrel, to come to *you* with this thing! But he knew better than to come to me *first*. I wonder he dared to come at all! Miss Harkness, don't be troubled about it; there's nothing of it, I assure you; nothing that need give you a moment's anxiety as to the result. You may be absolutely certain that this is the end of the whole affair; he would never dare go into court with that paper in the world. It was given to him, you may rest satisfied, for the sole purpose of extorting money from us privately, and with the agreement—which Mortimer would know how to make perfectly safe for himself—that it was never to be used in any public or legal way. Mr. Everton has made his attempt, and has failed; that's all. You'll hear no more of it."

"Is it true," asked Helen, gently, and with an entire absence of the lawyer's resentful

excitement, "that he lent papa money when he could get it nowhere else?"

"In any ordinarily disastrous time your father could always have got money, Miss Harkness. But the time that Everton alluded to was one when it could be got only of usurers like himself. He made your father pay three or four times what any man with a Christian conscience would have asked for it."

"And did it save papa from bankruptcy?"

"Everybody was in difficulties at that time; and ——"

"Do you think," pursued Helen, as if it were a branch of the same inquiry, "that he really supposes the auctioneer cheated?"

"Very likely he had his suspicions. He's full of all sorts of suspicions. I dare say he suspects that you and I were in collusion in regard to this matter, and prepared for him if he should ever come upon such an errand."

"Oh!" murmured Helen.

"Why should you worry yourself about it, Miss Harkness? As it was, he bought the house at a ruinously low figure, and it's worth now a third more than he paid for it six months ago."

"But you don't think it is possible the auctioneer could have done such a thing?"

"Oh, possible—yes, but extremely improbable."

"It makes me unhappy, very unhappy," said Helen. "I can't bear to have any doubt about it. It seems a kind of stain on papa's memory."

"Bless my soul, my dear young lady!" cried the lawyer, "what has it to do with your father's memory?"

"Everything, if I don't see the wrong righted."

"But if there hasn't been any wrong?"

"Ah, that's the worst; we can't find out! Mr. Hibbard, you never heard any one else express any misgivings about the sale?" The lawyer shifted a little in his chair, and betrayed a fleeting uneasiness, which he tried to hide—with a laugh. Helen was instantly upon him: "Oh, who *was* it?"

"I haven't admitted that it was anybody."

"But it was! You *must* tell me!"

"There's no reason why I shouldn't. It was as innocent a person as yourself: it was Captain Butler!"

"Captain Butler!"

"And I can tell you, for your entire satisfaction, I hope, that he went to the auctioneer and laid his doubt before him, and the auctioneer solemnly assured him that the bids were all *bona fide*, just as he now solemnly assures Mr. Everton that they were fictitious. But Captain Butler was not so shrewd as Mr. Everton—he didn't make the auctioneer put himself in writing."

Helen pulled her veil over her face. "And is—is there no way of solving the doubt?" she made out to ask.

"There is no doubt to solve, in *my* mind," said Mr. Hibbard. "I advised Captain Butler to dismiss the matter altogether, as I now advise you. I tell you that you've heard the last of Mr. Everton in this connection."

Helen did not answer. But presently she said: "Mr. Hibbard, I was going to come to you for some money. I understood from Captain Butler that you had charge of what was left for me, and that I could get it of you whenever I wanted it."

"Yes, certainly."

"In such sums as I like?"

The lawyer laughed. "In any sums short of the amount of Mr. Everton's claim."

Helen was daunted to find herself unmasked; but she only put on the bolder front. "But if I wish to pay that claim?"

"Then I should intervene, and say the claim did not exist."

"But if the money is mine?" she urged.

"If you insisted upon taking up all your money, I should, as Captain Butler's friend and as the old friend of your father, refuse to let you have it, unless you explicitly promised me that you would not give it to Mr. Everton. For it would literally be giving it to him."

"And if I said that you had no right to refuse it? If I told you that I was of age, and that I was determined to have it without conditions?"

"Then I should make bold to defy you at any risk till I had laid the whole matter before Captain Butler, and heard from him in reply. Now, my dear Miss Harkness," said the lawyer, "I know just how you feel about this matter; and I want you to believe that if I thought it was just, I should not only be willing to have you pay Mr. Everton's claim, but should urge you to pay it, even if it beggared you."

"Would it—would it take *all* the money?" faltered Helen.

"Yes, all. But it isn't to be thought of; the whole thing's in the air; it's preposterous." The lawyer went carefully and judicially into the whole case, and clearly explained the points and principles to Helen, who listened silently and to all appearance with conviction. At the end, he asked cheerfully, as he prepared to write a check, "And now, how much money shall I let you have to-day?"

"None!" said Helen. "I couldn't bear to touch it. I know that you feel as you say, and it seems as if you must be right. But if I

spent a cent of that money I could never be happy again unless I knew absolutely that there was nothing in this claim."

The lawyer smiled despairingly. "But you never *can* know absolutely!"

"Then I will never touch the money."

"Really, really," cried the lawyer, "this is too bad. Do you want me to give you this money to throw into the street? I honestly believe that the first man who picked it up there would have as much right to it as Mr. Everton."

"Yes, but nobody *knows*," said Helen, rising. "I'm sorry to give you all this trouble, and take up your time; and I wish that I needn't seem so obstinate and unreasonable; but indeed, indeed I can't help it."

"Confound the old rascal!" exclaimed Mr. Hibbard. "I wish I'd indulged myself in kicking him out of doors. Miss Harkness, I'll inquire into this matter, and in the meantime I'll write to Captain Butler. Do you think that I can do more?"

"No."

"And now I shall be glad to give you any money on account."

"I can't take any," said Helen; "it would be quite the same thing. I never could pay it back, and if it turned out that it belonged to him, I should be either a beggar or a thief."

The lawyer gave a roar of expostulation. "But if you are out of money what will you do?"

"I have a little yet. Captain Butler supplied me with money before he went away, and I have still some of it left." This was true. She had been using what she called Mr. Trufitt's money, and she had a dollar and seventy-five cents left of the sum that Captain Butler had made her believe was hers.

The lawyer, on his part, forbore to explain that the money Captain Butler gave her must have been in anticipation of interest on the five thousand dollars he held for her. He only said, "But you will accept a loan from me?"

"No; I shouldn't feel that I was making any sacrifice then."

"But why, under heaven, *should* you make a sacrifice?" demanded the business man of the girl.

"I must — to feel true to myself," she answered; and something like this absurdity she repeated in answer to all his prayers and reasons, and went away empty-handed at the end.

(To be continued.)

THE LEGEND OF PADRE JOSÉ.

In the beautiful city of Monterey, close beside the old Franciscan convent, there stands a single stately palm, larger and more perfect in its growth than any other palm that you will find in all the country for miles around. It grows upon an odd corner of waste land — that very likely was the convent garden a couple of hundred years or so ago — and behind it, across the broad sweep of the tree-clad valley, the blue Sierra raises its jagged crest against the bluer sky.

Instinctively you know, as you look at this beautiful palm — with its waving, feathery branches reared high toward heaven, and its deep-set roots drawing strength from the ground that the good fathers long ago made holy by their prayers — that it has a story of some sort to tell; that a meaning attaches to its presence beside the convent wall; that it came there, back in the misty past, by no mere idle chance. But among the gentlefolk of Monterey, you will ask in vain for this solitary palm's story. Culture and refinement somehow are at war with the sweet traditions which modestly, along quiet ways, come down to us from times of old. And so, if you would know the story you must seek it among the humble dwellers in the town: the *cargadores*, who carry heavy loads of other people's goods upon their shoulders; the *serenos*, who watch over the safety of the city in the still, dark hours of night; the patient *leñadores*, who bring in wood, loaded upon yet more patient *burros*, from the mountains near at hand, or other of the children of toil: for all of these, knowing not of books, and busying themselves not with the serious thoughts and concerns which vex the souls of their betters, are learned in legendary lore. In these simple, trustful minds, illuminating them with a light that brightens the dark places of weary lives, the old stories live on through the centuries; passing from lip to heart, from heart to lip, and so to heart again, yet gaining always a more mellow beauty with the passing years. Therefore, it must be among the lowly folk of Monterey that you search for the story of the stately palm; and if your search be well sped, you will hear told, in the gracious Spanish of Mexico — which is richer and softer, even than is the rich, soft Spanish of Spain — this legend of the Padre José.

Padre José was not bred to the Church from his youth. He was the son of the gallant soldier Don Diego de Vargas, and his profession was that of his father: the sword. When Don Diego was ordered up into the rebellious northern country—back in the year 1692 this was, before the father of the oldest man now living was born—Don José went also. And this although the day was named for the wedding, and the Doña Ana de Oñate, most beautiful of all the maidens in the realm of New Spain, was waiting to be his bride. As all the world knows, there was hard fighting during that campaign. For a dozen years the revolted Pueblos had stood out against their Spanish masters, and even Don Diego, with all his gallantry, and with all his soldierly skill, could not in a moment conquer them. There were battles at Santa Cruz de la Cañada, at San Yldefonso, at Taos; even under the very walls of Santa Fe. But the campaign ended, and Don Diego drew his forces southward again for rest while the winter lasted, and yet the Spaniards were not conquerors. It was about the blessed Christmas season—the *noche buena*—that the sad news came down to Doña Ana, in the city of Mexico, that in one of these battles her lover had been slain. And so, no joyfulness being left in life, she entered the stern order of the Capuchinas. Passing into and so beyond the grave—as was that order's wont—she to the world was dead.

Through that new year, and through great part of the next, Don Diego battled with the Pueblos; and finally, having subdued them, he came gallantly home; and, a strange thing! with him came Don José, alive and well! Being taken prisoner in the fight on the *mesa* before San Yldefonso, he had been carried off into the mountains of the Sangre de Cristo and there held for near two whole years. His was a dreary home-coming, for his promised bride was wedded to the holy church, and so was lost to him utterly. There was no light of hope left for him in the world at all. Terrible was Don José's raging agony. At last, in his fierce despair, he cursed the holy church for severing him from his love. But God was merciful to this sinner, and, instead of consuming him in a moment in wrathful flame, sent to him a messenger of peace. That night the blessed Saint Francis appeared to him in a vision and told him that his dread sin would be pardoned and even, in the end, rest from his fierce sorrow would be given him, if he would devote his life to God's service in saving heathen souls. Therefore, Don José entered the order of the Franciscans. Nor did he, as is the wont of those who enter the religious life, change his name. As José, he said, he had sinned; and as José he would work out, in deeds meet for repentance, his full forgiveness. And as José is a name most holy, and most beloved in the church, there was none to cavil.

Because there were few heathen thereabouts, but more because he felt that he could be stronger in his faith and work if widely separated from his dead yet living love, Padre José asked to be sent out from the City of Mexico into some far corner of the land. And so it fell out that Padre José was sent to make his home in the old Franciscan convent here in the city of Monterey. Even in the first year of his service many were the wandering souls that his love and gentleness and great compassion brought safe to shelter in the good care of God.

Yet for a long while there was only sorrow in the heart of Padre José. His good works gladdened others, but himself they made not glad; for always rose up between him and happiness the memory of his lost love. His was a gentle, clinging nature—albeit a most gallant one, as his brave deeds of arms time and again had shown—and the need for a personal love was strong within him. There was a holy comfort in his love of the good God, and in his love of working for His dear sake; but this touched only the spiritual side of his nature, and left his human longing for something real, that he might tend and cherish, and, if need be, spend his life for, all unsatisfied. While this blank in his being remained unfilled there was nothing to check the return of his love to the dear one who had passed from him into the bosom of the church; of whom, even to think, as the poor padre but too well knew, was deadly sin. So his soul was wrenched and torn within him by this ever-recurring conflict between his holy duty and his human love.

Therefore it came to pass that the kind God, seeing how loyally the Padre José strove to do his duty, and how bitter hard that duty was to do, one day took pity upon him and lightened his heavy load.

Beneath the hot sun that beats down so fiercely here in the long summer time, making the air one quivering cloud of scorching heat, Padre José came slowly across the valley toward the town. He came from the little chapel of Our Lady of Guadalupe, over on the first of the foot-hills; and his heart was heavy, for few, and careless of its meaning, were the Indians who had come to his celebration of the mass. The distance from the chapel to the convent is but a mile—a trifling walk on one of the cool, crisp, October-like days which serve for winter here in Monterey.

But beneath that summer sun even a strong man would have grown faint and weary—if he had not fallen outright by the way. The strength of Padre José was given so largely to the service of God that but little remained for his own needs; and so, midway in his weary walk, coming to a place where a tangle of mesquites cast a warm shadow—that yet, in contrast with the fiery sunshine, was refreshingly cool—he thankfully cast himself down upon the ground for rest.

Close beside where he sat was a field just cleared for planting, and along the newly made *acequia* the brown water was moving slowly, and was giving great solace to the thirsty land. It is thought by some that the large field set about with *palmas*, on the slope below the chapel of Guadalupe, is the very field beside which Padre José rested that day. Whether this be truth—as it well may be—or only a fancy, we may not know; but it surely is true that while the Padre sat there resting he saw lying in the dust of the wayside, where it had been carelessly tossed when plucked up from the ground, a little palm-tree scarce a span long—a thin, green shoot, rudely wrested from the place where it had begun its innocent, joyous life, and thus cast forth to die. At first the Padre, worn by the heat and by the sorrow of his heart, thought not at all of this poor little palm on which his eyes rested idly. And when, presently, he perceived its presence, and understood its evil plight, there came for it no compassion into his heart. He even, for a little space, felt a cruel pleasure in watching it lie shriveling there in the scorching sunshine, while he sat resting in the shade—so hard and bitter was his mood.

But such wicked feelings as these could not long find harbor in the Padre's breast. Soon a sense of great shame, and of horror at his own sinfulness, came over him; and he rose up, praying that he might be forgiven, and that he might, with God's good help, save the little palm's life. Through the blistering sunshine—forgetful that his hood had fallen back from off his tonsured head—he carried the sorrowful little tree to the *acequia* and plunged it into the refreshment of the slow-moving brown water; and held it there, tenderly, until the pitiful limpness vanished from the tiny leaves and there was something of firmness in the pale green stem. And he felt that this mourning thing, now made joyful, was offering its thanks to him. Then, in some soft moss that he found beneath the grove of mesquites, well wet, so that a grateful dampness might be had for the rest of the hot walk, he enwrapped it lovingly—and so set off once more for the town. Not until he sat resting in his still, cool cell, the little palm meanwhile having been planted in rich, moist earth in the convent garden, and carefully shaded from the sun until its strength should come again, did Padre José realize that in lightening the troubles of this poor, forsaken tree he had for a brief space wholly ceased to feel the weight of his own. And as he prayed there, in the shady stillness of his cell, the thought came into his heart that God, in His infinite goodness and mercy, had sent him this little palm that he might have something to love. Being yet upon his knees, he prayed from out the depths of his simple, truthful soul that this good gift might indeed be his, and that the little palm might live.

And the palm did live. From day to day, from week to week, as Padre José tended it lovingly and faithfully, praying the while for its well-being with the same trusting faith that he was wont to pray for the saving of heathen souls, it grew and flourished; and it rejoiced in the strength of its regained life with a visible gladness that was reflected into and that gladdened his own sorrowing heart. When the weariness of his labor rested heavily upon him; when a dark despondency seized him and the thought weighed upon his soul that his work among the heathen was in vain, and that should he die no one would have been the better for his life or would be the worse for his death—then stealing in upon this darkness of sorrow would come the sweet consciousness that the palm lived and loved him and depended upon him. And the other, the human love that so wrenched and tormented him, and that could not, in its very nature, be cast out of his being, was tempered and chastened by this purer love. When, in the early morning, and again in the evening's dusk, he came to his palm and ministered to its wants—giving it draughts of sweet water, heaping rich earth about its roots, pruning away its too-luxuriant leaves so that its life might be concentrated and strengthened for a more vigorous growth—the memory of his early, passionate love would come back to him: but comfortingly, being purified. And as he went about his holy work by day, the thought of the little tree that loved him and that waited for his return at night, upheld and strengthened him.

The palm, for its part, repaid the care that Padre José gave it by growing as never palm grew before. Its slim stem became thick and sturdy; its gracious leaves spread out in a feathery crest, and everywhere upon it were the signs of a rich, abundant life.

So the months slipped silently away, and were lost in the depths of the passing years,

and the palm shot up and became a strong, beautiful tree; and because of its existence there came to be, if not happiness, at least a refreshing love that bred peace in the heart of Padre José. And so was fulfilled the promise that God made to him, speaking by the blessed St. Francis in the vision.

Thus more than a score of years passed on. Through all this time the Padre José gave of his strength freely in his holy work, and many heathen souls were saved which, but for his zealous labor surely would have been lost. His palm long since had outgrown his care for it, and now, in its turn, cared for him—even as his sturdy son, being come to man's estate, might have cared for him had it pleased Heaven to satisfy his human love. It was a noble tree now; and against its foot he had made a seat, where he would come in the early morning, and again as the sun went down, for rest and comforting. And the palm, swaying a little in the evening breeze, would press its trunk against him lovingly, and soft whisperings of its thankfulness for the life that he had given it would come down to him from its rustling, feathery leaves. When he was sad, thinking of the weariness of life and of all the sorrow that there was therein, the palm-leaves rustled to him mournfully in echo of the mourning that was in his heart. Yet, imperceptibly, the tone of their murmurings would change, bringing into his heart more and more of brightness.

At other times, when the memory of his lost love on earth would come back to him and fill him with a dreary sadness, the palm would whisper of its own love and faithfulness. It would tell of its bitter sorrow as it lay in the scorching sunshine by the wayside where he found it cast out to die, and of its joy when his hands gave it water to drink and shielded it in the cool, damp moss, and gave it, too, there in the convent garden, a safe refuge where it might rejoice in its new-found life.

But it came to pass, at the end of many years, that a pestilence fell upon the city—a deadly fever that rose up from the earth and that caused many to die; such a fever as never before was known, and, mercifully, never since has been known here in Monterey. In every house was the shadow of death. The fathers of the convent were instant in good works among the sick; and even, that they might have more time to save the living, they forebore for a season to say masses for the dead. Only each morning and each night the townsfolk in whom was left strength to walk, came to the church of St. Francis, and there, together with the good fathers, sent up their prayers that the pestilence might be stayed.

And when the deaths grew many, and there was sore need for yet more nurses for the sick, the convent of the *Capuchinas* opened its doors, and the holy nuns came forth and gave their aid. (The Holy Father gave them grace and fullest absolution when, in the after years, their prayer for pardon went to Rome.) The blessed presence and sweet gentleness of these saintly nuns brought comfort into many a stricken house in that most dreary time. But—such was the division of their work among the sick—the *Franciscanos* and the Capuchinas rarely met.

Faithful was Padre José in caring for the sick, and in consoling in the name of the blessed saints those whose sickness was even unto death. Almost his only rest was the little space, morning and evening, when he sat beneath his palm. And being, after his many years of zealous labor, but a frail man, and going thus constantly into those places where the pestilence was at its worst, the time came when he himself felt that the fever had him in its hold; and his heart was gladdened, for he knew that now his rest would come.

Close upon the evening of the third day, feeling then that his release was near, he asked that they would carry him out beyond the convent walls into the garden, and place him in the seat beneath his palm, and leave him there.

Beautiful is the evening in Monterey. When the sun has sunk beyond the crest of the noble Mitra, a great burst of red and golden glory leaps up into the sky and for a long time hangs quivering there above the mountains. Clouds of gorgeous coloring float beyond the Sierra and outline its somber, jagged ridge against their rich splendor; and through the clefts between the peaks, broad rays of light shoot out across the valley, and bathe the farther mountains in a liquid flame. And even more beautiful, or, perhaps, only differently beautiful, is the time, a little after this, when the glorious magnificence has vanished from the sky, and in its place have come subdued, delicious colorings—echoes of the splendor that has passed away.

And Padre José, sitting beneath his palm, with the fever quite gone from him—for it had done its work—thanked God in his heart that this most perfect earthly beauty should be his last sight of earth. It was a fit prelude, as he whispered to the palm—his head resting, as for years he had been wont as he sat there to rest it, against the palm's loving trunk—for the sight yet more beautiful, being heavenly, that would be his so soon. Dreamily he whispered his thankfulness for all that the palm had been to him; for all its constant tenderness and love through these long

years. Then the cool evening wind, which sweeps down from the mountains at the end of the hot days, and brings with it a most delectable refreshment, passed softly through the palm leaves, and made again the old, sweet story of the palm-tree's gratitude and love. And, possessing none of the selfishness that goes with, if, indeed, it be not the very essence of, all human love, the palm-tree murmured its own joyfulness that the time had come when the one whom it loved so truly would cease to be acquainted with sorrow, and would know only the perfect happiness of an endless, holy peace.

Then the Padre whispered again, or it may be that this thought was framed only in his heart, his longing to see the Doña Ana yet once more before his eyes forever closed to things of earth. And, lo! as this longing rested upon his soul, there came to the open gate of the convent garden—being led thither, surely, by God's good grace—a holy nun; and, looking on her face, the Padre José knew that for the little time of life yet left to him the love that he had lost was found!

So she sat beside him, beneath the palm, stroking his cold hand lovingly; yet with a love chastened by long suffering of love's lack, and now sanctified because it welled out anew toward one upon whom rested visibly the hand of death. Together they talked of the long years which, in their severed lives, would have been dead years but for the life that had come to each from a living love of God; and as they talked, Padre José came to know that in all this dreary time she had not been afar from him, but near at hand—watching over him as an angel might have watched, and rejoicing in the fair perfection of his holy work. For she had prayed that she might be sent to where he was; and her prayer had been granted through a firm confidence in her loyal faith to the higher love which she had professed in taking upon her her holy vows.

Slowly the splendor of the sky and mountains faded into the mellow half-tints and subtle blendings of delicate colorings through which the gracious sunlight passes before it is lost in the dull dusk of night. As she cherished it between her own warm hands the hand of Padre José grew yet more cold; and she knew how little was left to him of life.

Presently, as the light grew fainter and fainter, and as the spirit of Padre José grew less and less a thing of earth, so near to heaven had it come, there sounded through the stillness of the evening air the ringing of the angelus: a low, tremulous ringing, for the ringer in the tower was worn with much toil and watching, and scarce had strength left in him to sound the call to prayer. There was a wailing melancholy, yet a deep tenderness in the faint ringing of this sweet bell, as though it mourned—yet with a great compassion, in which was hope.

And as its dying tones vibrated softly through the dusky air, there went a shivering rustle through the branches of the deserted palm, there came a thrill of mortal agony into a lonely woman's heart—for the spirit of Padre José, leaving poor, earthly love behind it, and leaving behind it harsh earthly toil and care, had passed hence into the perfect love of heaven, into the perfect and eternal rest.

HEREIN is seen a mystery of the natures of man and woman. The man, to banish his love, had sought to place the woman afar from him; but the woman, not less resolutely determined that her love should be crushed, knew that she best could crush it when near the man.

Thomas A. Janvier.

A BREATHING TIME.

HERE is a breathing time, and rest for a little season;
Here have I drained deep draughts out of the springs of life;
Here, as of old, while still unacquainted with toil and faintness,
Stretched are my veins with strength, fearless my heart and at peace.
I have come back from the crowd, the blinding strife, and the tumult,
Pain and the shadow of pain, sorrow in silence endured:
Fighting at last I have fallen, and sought the breast of the Mother,—
Quite cast down I have crept close to the broad sweet earth.
Lo, out of failure triumph! Renewed the wavering courage,
Tense the unstrung nerves, steadfast the faltering knees!
Weary no more, nor faint, nor grieved at heart, nor despairing,
Hushed in the earth's green lap, lulled to slumber and dreams.

Charles G. D. Roberts.

EARLY LETTERS OF EMERSON.

BEFORE me lie four letters. They are clear as print, but brown and brittle with many reverent unfoldings. They were written sixty years ago, by a youth who had just been graduated from Harvard College, and they betray something of that loneliness and dreariness which follows shortly upon chipping the shell of a new phase of existence. The youth addresses, in a sort of playful envy, a classmate who has gone directly from the studies of Harvard to the studies of Andover. The first letter bears the date of the writer's death, April 27th; but the year is 1822. It is written in Boston.

MY DEAR LORD W * * *: A tall cousin of mine (Mr. Shepard) hath informed me that you have lately descended upon them at Andover to learn their good ways—from the miserable school of heterodoxy at Cambridge. Now I determined forthwith to write to my right scholarly classmate, for several distinct reasons:—to congratulate you upon your singular exemption from the general misery of your compeers, who have rushed into the tutor's desks of every Minerva's temple in the country; then to claim the honour of corresponding with one scholar in the land,—and to enjoin it upon you, as a primal duty, to write a letter from your seat of science, to a desponding school-master. I am delighted to hear there is such a profound studying of German and Hebrew, Parkhurst and Jahn, and such other names as the memory aches to think of, on foot at Andover. Meantime Unitarianism will not hide her honours; as many hard names are taken, and as much theological mischief is planned at Cambridge as at Andover. By the time this generation gets upon the stage, if the controversy will not have ceased, it will run such a tide that we shall hardly be able to speak to one another, and there will be a Guelf and Ghibeline quarrel, which cannot tell where the differences lie. * * * I have a high respect for Professor Stuart, but have never seen him. I want you to write me a description of his mind, body, and outward estate. The good people abroad, who are Calvinists up to the chin, do not treat him well. He watches upon their outposts, and receives all the weapons of the enemy, and those within the pale, his brethren of Connecticut, accuse him of apostacy. They should know, that the opposite party humbly judge that if they lose him they lose all, and that any party can boast few such redeeming Palladiums.

What are you studying beside Bibles? Do you let suns and moons, eclipses and comets pass without calculation or account? Is there not time for trigonometry, no, not for a logarithm? Or, if all these are forgotten, I hope you have not sacrificed Johnson and Burke, Shakspeare and Scott altogether. Books are not so numerous at Andover, but that you will want the Cambridge library, which, by the way, grows rich rapidly, and bids fair to load its shelves to the breaking point, under the care of such an eloquent beggar as Professor Cogswell. He has already won away to the library most of the splendid European books in Boston, and obliged Mr. Thorndike to cover the Ebeling library, which he presented. But whatever may be your pursuits, your designs, or your advantages, this is to remind you that I expect a very literary letter which may unfold them all to my admiration. You can form no conception how much one grovelling in the city needs the excitement and impulse of literary example. The sight of broad, vellum-bound quartos, the very mention of Greek and German names, the glimpse of a dusty, tugging scholar will wake you up to emulation for a month.

You will excuse the liberty I have taken, in addressing myself to you unasked, to solicit a correspondence, but I am aweary of myself * * *. I suppose you may know opportunities to send to Frye, if not, pray drop a letter into the Post Office, the first time you pass by it, to

Your friend and classmate,
R. WALDO EMERSON.

In this pleasant, little, limpid, sometimes plaintive, ripple of phrases,—occasionally sophomoric, one sees no sign of the magnificent swell, the

"Full-fed river, winding slow,"

of his later speech. In the course of his next letter, he speaks with eager, boyish enthusiasm of a charming new writer, a novelist, Walter Scott. He was preëmpting a new field in literature at that time, for before it, fond as one might be of vivid pictures of social life, one could find few novels tolerable to a sound head and a clean heart. And yet the

austere, *triste* life of ancient New England created a great craving for some sort of stimulant. Happy they who found it in thought, instead of wine!

BOSTON, July 27, 1822.

MY DEAR SIR: I am glad to hear I have a letter from you, which, with true collegiate negligence, my brother has kept carefully for me at Cambridge this fortnight. Of course, I cannot answer it, nor can I tell whether, in the delicate eye of the law, I can yet be construed into a debtor in correspondence; but as a tall cousin aforesaid is again on the wing to academic bowers, I am quite willing to advance the payment of a letter upon the security of my brother's word.—I have this moment finished the first volume of "Fortunes of Nigel," which I fear is excluded from your reading catalogue, because it is so unfortunate as to bear the name of a *novel*. But if masterly, unrivalled genius add any weight to the invitation for a scholar to step out of his Greek and Hebrew circle of sad enchantments, that he may pluck such flowers of taste and fancy as never bloomed before, to deck his strength withal,—why then he may read Scott, and particularly the latter novels.

In this book there is nothing akin to any novels of another man. There is no unskilful crowding of incident,—indeed there is very little incident at all; the interest is maintained by the very elevated and animating and yet perfectly natural tone of the conversation which is kept up. The youngest observer of human society recognizes circumstances corresponding entirely with the records of his own mind; and in all the strangeness and remoteness of the scenes and persons, I have twenty times borne witness to the sagacity of observations which I had many times felt to be true without ever having expressed them. Our sternest scholars must admire the genius of this unrivalled seer whose fruitful invention already surpasses the "One Thousand and One Tales" of Arabian Entertainment. Next to Shakspeare, he will stand highest with posterity, and there is but one consideration that should lead me to give unhesitating preference to the dramatist, and that is, the circumstance named in some review or other, that Shakspeare stands alone in this: that all his characters, each being perfect and original, are utterly distinct from one another: that when he had exhausted art upon Hamlet, upon Othello, upon Jaques, that character is thrown off at once and hinted at in no other play whatever.* But in Scott, we commonly complain of a new representation of the same persons; and in Byron we always complain. Perhaps it is wasting your time to trouble you with my lucubrations about novels and poetical idolatry. But at the moment, I have it more at heart than aught else; and if, when you read this, you be stooping to some musty folio which suffered under the types a century ago, you will oblige me by transferring your solemn thoughts thereupon to paper for me; yea, if it be a *dictionary*, if it be anything earthly but mathematics.

I doubt not you deplored the loss which Cambridge and the community sustained in the death of the Professor [Frisbie]. And I need not tell you how much you lost in being absent from the Eulogy, which equalled Mr. Norton's other productions. It is a happy lot, "*laudari a laudato viro*," and never probably was praise more sincere or true. If the eulogy had defects, we did not find them out, and the critics, with you or elsewhere, must wait till it comes from the press,—and then remember that it was written in *two days* by a man who submits his writings always to Horace's rule of 'nine years.' It will cost the corporation no little trouble to find a successor to the vacant chair, for boast as we will of our literary society, there is nobody here with a claim to the place. Is there any man in your schools of prophets competent to the office?

The North Am. Review, which came out yesterday, is a very fine number. The article on Mirabeau is the best, but I do not know its author. The long piece in it on ancient and modern poetry by one of your scholars, Marsh, I have not yet read, but have been told it was very good. Cushing reviewed Webster; and Everett, "Bracebridge Hall." In American books we feel quite proud of "Europe" (Alex. Everett's), "The Spy," and "N. England Tale." Add to this, Mr. Tudor's new work, "Life of James Otis," not yet published, but of which much is expected from the known talents of the author. Self-complacent America will lift her head yet higher in the pride of literature, when she sees the English press anxiously claiming "Europe" as the work of some Englishman. But I may as well stop from telling old news.

Have you any very bright stars which shall be lighted in your church? Your classes are so large as certainly to contain one or two magnates. But I have been disappointed in general, when I have heard young candidates preach at Park street. Why? Are there faults in the instruction? or shall I venture the wicked question whether it is impossible for minds of a certain order to submit to certain systems? But milord frowns

* Falstaff is continued professedly under the same name. The *Fools* are necessarily the same.

—and with reason— "And finds *within*, denial of the tale."

* * * * * *

R. Waldo Emerson.

It seems hardly right to let all the world in to observe the mind of Emerson in this confidential morning undress, as it were. But Charlotte Bronté says: "The real refinement of a nature appears most genuinely in the disclosures made *en dishabille*." How generous and impersonal are all the comments of this young student! How purely mental the objects of his interest and enthusiasm! "It is a happy lot *laudari a laudato viro*," says the wistful, shy youth. Who ever lived to taste this "happy lot" more deeply? Emerson, when thirty years old, made a reverent pilgrimage to Carlyle. The cynical oracle used afterward to speak of the young American as dawning upon him like an angel—a supernal vision. Here in Washington Charles Sumner, America's bravest and most ideal statesman, died after living to see "ideas that got mobbed out of lecture-rooms come back to sit throned in the Capitol." It is remembered that as the strong heart was panting out its last beats in agony, some one named Emerson. The dulling ear caught the sound, the paling lips murmured: "Tell him I love him; tell him I revere him!"

The next letter opens with a yearning curiosity toward a star destined to rule greatly in his life—Plato.

Boston, 21 November, 1822.

I have had it in contemplation for some time to try my pen in French and send you a Gallic epistle; but I am so indolent this evening that I must write Kings' English. My first question regards Plato. For the love of Athens, I pray you tell me what golden thoughts you have culled from the oracle of so many centuries? Have you found the source of heresies and the models of all bad creeds? And chiefly have you found that "etherial imagination," which all books ascribe to Plato, and which of all his excellencies I am the least willing to take upon trust. I confide in your scholarly character, that you spurn translations and read the Greek. From my very limited knowledge of the philosopher, I should judge that, of all the ancients, he is most a citizen of the world, that is, soared above his time and judged of men and things *then*, as a speculative man does to-day. One difficulty always meets me there, to wit, how to distinguish Socrates from his disciple. When a man writes a biography of Socrates, he ransacks Plato as if he were another Boswell. But when Plato is the hero of the tale, poor Socrates becomes a theoretic personage, yea, the mere mouth of his disciple. Now these contradictions it is incumbent upon your learning to reconcile, and I shall expect your solution with impatience. If Plato be the thing I have imagined him to be, namely, a philosophy not too profound for easy comprehension, mixed and softened with a proportion of imagination and poetry—enough to adapt it to an idle eye and a vacant hour —why, in that case nothing but his Greek should appall me. By and by the gods may grant your aspiring correspondent some few more nerves of perseverance, and a few more mercurial drops of activity. Some winter day shall perhaps cool down the superfluous heats of imagination, and leave room for sterner elements to grow, if such there be. And perhaps, my lord, some summer day shall thaw down the frosty coat, which, men complain, conceals your faculties and buries the "light" of the world in an icy napkin. You will excuse my wicked pen, who, I find, is not to be trusted with ink.

Does Blackstone still march along side of Rosenmüller? I had rather hear from you the fruits of your studies than your complaints of the parties, which, I suppose, is a necessary consequence of living in a theological school.

I have hardly traveled far enough in Demosthenes to boast of much acquaintance with the best eloquence of the world. I promise myself great satisfaction hereafter in repaying tit for tat, and transmitting a sheet worthy of the Scoliast on the orator, to return your strictures upon Plato. So much castle building for our sublime correspondence. I have read one very useful book of late, which you will like, I know, Stewart's Second Dissertation. It saves you a world of reading by laying open the history of moral and intellectual philosophy since the Revival of Letters, exposing the rise and fall of successive theories, and the amount of each man's addition to the common stock. It is a beautiful and instructive abridgement of the thousand volumes of Locke, Leibnitz, Voltaire, Bayle, Kant, and the rest,—by a man "amply qualified for the task." The next books in order upon my table are Hume and Gibbon's Miscellanies. I shall be on the high road to ruin shortly with such companions, but I cannot help admiring the genius and novelty of the one, and the greatness and profound learning of the other, maugre the scepticism and abominable sneers of both. If you read Hume, you have to *think;* and Gibbon wakes you up from slumber, to wish yourself a scholar, and resolve to be one. And with regard to the danger, if you have not yet grounded yourself in your faith, still our New

England education sets all our prejudices in arms against them, and we are not likely to be buffeted. Therefore I think them both very good books to read. Gibbon values himself upon knowing thoroughly whatever he touches, and this, it seems to me, is the prime virtue of an historian.

When time shall suffer me to go to the schools and open the Divinity folios, I hope to come into your neighborhood. But am not sure with regard to the propriety of one who thinks himself an Unitarian — asking the bounty of Andover. I believe that although laws and charters may favour my coming, the *spirit* of the same would not; nor would it be construed as strict honour and good faith, to come and steal from their armoury, the weapons which I intended to wield, certainly not *for*, and perhaps against them. Besides, I apprehend, the spirit of the community being somewhat against heresy, that I should hardly be favourably eyed by my fellow-students. You would oblige me much by solving my doubts on this topic.

I have almost filled my page and think it high time to dismiss this scrawl from

Your friend and classmate,

R. Waldo Emerson.

This letter shows the development of that bee-like quality of his mind, that ever more and more distilled the honey only, from all books and all persons and all events. One had to be careful, indeed, how one over-filled one's third page, when envelopes were uninvented: the letters must be neatly folded and infolded, and sealed; the address written upon the blank fourth page.

The fourth letter contains the sole allusions of the four, to anything feminine.

Boston, Jan. 29, 1823.

If I am not mistaken, I am your debtor on the epistolary account, and intend to pay you in current money, though I cannot in your own Roman coin [referring to a preceding Latin letter]. I dislike cordially an exact correspondence which makes it binding on the conscience of the receiver of a letter, to write his answer by the next post. I rather choose to claim the liberty of writing when I am in the humour, and in what dialect of the nations I will. If to write twice without waiting for an answer, please my despotic whims, I shall write twice; or if I should let my pen rot a whole year unwet, I should feel no qualms. Claiming so large a charter for myself, I must needs allow the same to those who honour me with their epistles, and if my lord would not always wait for my tardy letter, but would sometimes vouchsafe a gratuitous sheet, I should be exceedingly grateful. Thus much for preamble. You will find the "N. A. Review" impregnated from title-page to Finis with Everett's spirit. I never saw one so exclusively his own. I am sorry I do not yet know the different authors, to give you the list, but presume he must have written at least half the book. Von Haunier's "Constantinople" and Humboldt's travels I know to be his. The tragedy piece is probably his brother's. Beyond the new book I can have little to say. For what can be expected from an unlucky apprentice at the trade of Dionysius, who writes to a dweller amid folios, libraries, and professors? You hold in your hand the keys of all the Past, whilst I can only deal out the crumbs of to-day's gossip. I covet your lofty contemplations, your "*ruinas ecclesiæ*" and plans, no doubt, for adamantine foundations of a new temple. I hope persecution does not, indeed, light his fires in your college halls, but lying Rumour has a hard story to tell about the brotherly love of your professors. If there be iniquity, heaven keep the hands of the *Rabbi* clean from its pollution.

I have heard it stated that the case is deemed of extensive interest, because upon its result hangs the question whether a man can be dismissed from an elective office upon such a charge as incompetency, when such incompetency existed at the time of his election. If you decide it the wrong way, many a poor professor must take up his bed and walk. Besides, the same decision would affect the church, and a frivolous charge of incompetency would oust half the clergy of the land. Our Andover college of Cardinals, who look after the Ecclesiastical State, must beware of giving facilities to the divorce of Pastor and Church any more than of Husband and Wife; because an evil closely analogous would speedily accrue to the community, since it would destroy that mutual obligation to keep the peace with each other which the Necessity of their union imposes. Moreover, a decision of the consistory against the professor would infringe somewhat upon the old rule, that, as it takes two to make, so it takes two to break a bargain.

How do the studies of your class and closet flourish? The only objection that I can think of, at this moment, to your mode of study is, that you all live double; at Cambridge a graduate can get a room alone. This, no doubt, appears an indifferent matter to yourself, with most abstracted and silent habits; but to a butterfly personage like myself, who cannot help thinking upon the thousand things which flit about me, entire solitude is an immense advantage. I put on faith in the

maxim, "magna civitas, magna solitudo; I should substitute *multitudo*." A man in a million, or in ten, or in two, is but a common, equal man; whereas a man, alone, is a very important person; is in his thoughts, lord of the past, and hope of the future; commands the spirits of earth, air and heaven with a calm majesty exclusively known to solitude. There is an unlucky consciousness of which I can never divest myself that there is a breathing being in the room, and this cramps the pen that it cannot scamper freely over my page, or carries away mine eye from the lines of my book, and I feel very strongly persuaded that the success wherewith I study Divinity depends essentially upon this circumstance.
